Truth and reconciliation commissions have sought to address genocide and crimes against humanity by settler-nation states². Thus, state apologies are often officiated and announced by governments in relation to their past actions by, and are therefore orchestrated and informed by intergenerational neoliberal settler colonial worldviews. Such movements, as McCready (2009) writes, are a “cultural force that perpetuates individualism, cynicism and the frantic guarding of social privilege” (p. 163). Moreover, he reminds us that in Canada specifically, neoliberalism has manifested in multicultural policies that deflect the demands of marginalized groups, emerging as a “highly effective governmental technology for managing difference” (p. 166). In relation to this nation-state context, discourses of “racelessness” perpetuate what Goldberg (2007) defines as the “attempt to go beyond-without (fully) coming to terms with-racial histories and their accompanying racist inequities and inequities” (p. 217). Thus,

²In this article, the terms “settler” and “settler Canadian” are used to describe peoples who came to Canada with agency and choice, to benefit economically from the land through different past and present colonial policies. Therefore, Black Canadians, as the descendants of enslaved peoples, as well as immigrants and refugees fleeing war, discrimination, injustices, and oppressions are not constituted as settler colonial Canadians. For more discussion on this, see Thomas (2019).

neoliberalism defines and limits the ways that reconciliation, redress, and future relations between Indigenous peoples and Canadians are able to take (McCready, 2009). “Expressing sympathy for a historic wrong comfortably locates colonialism in the past rather than the present and is,” as McCready (2009) maintains, “an act that confirms a dearly held narrative of the evolution of settler Canadian attitudes from regrettable original violence, through past “misunderstandings” and unfortunate “mistakes” to present day post-racial equity” (p. 167). Canadians have continuously witnessed the historicizing of past wrongs by successive federal governments. Over the past 20 years alone, Canada has issued 39 national apologies for historical injustices, including for the internment of Japanese-Canadians during the Second World War, the head tax imposed on Chinese immigrants between 1885 and 1923, and for the 1914 Komagata Maru incident, in which several hundred Indian immigrants were turned away from Vancouver and returned to India, where some were killed, and others arrested (Institute for the Study of Human Rights, 2021).

More recently, the Canadian government’s apologies have been focused on reconciliation with Indigenous peoples, including official apologies for the Indian Residential Schooling system,³ the mistreatment of Inuit with tuberculosis in the mid-20th century, and for the forced relocations of hundreds of Inuit people during the 1950s. On June 25, 2021, Prime Minister Justin Trudeau once again apologized for government policies that forced First Nations, Inuit, and Métis children to attend the Residential Schooling system. This latest apology came after the confirmation of 751 unmarked graves at the site of the former Marieval Indian Residential School on Cowessess First Nation. This occurred less than two months after the remains of 215 children were identified and recovered from the site of the former Kamloops Residential School in Tk’emlups te Secwépemc First Nation (Leichnetz, 2021). In his ensuing public address, Prime Minister Trudeau apologized to members of the Cowessess community and Treaty Four communities, stating that:

We are sorry. It was something that we cannot undo in the past, but we can pledge ourselves every day to fix in the present and into the future. That means recognizing the harms, the impacts, the inter-generational trauma, the cycles of challenges that far too many Indigenous peoples face in this country because of actions that the federal government and other partners deliberately and willingly undertook.

Cpac (2021, 03:36)

His apology was immediately met with calls for accountability and action, including from Pam Palmater, a Mi’kmaq lawyer and professor, and author of *Warrior Life: Indigenous Resurgence and Resistance*. Palmater reminded Canadians, “Apologies are important for those who need healing or closure ... but it’s also about providing financial supports, human resources, equipment, and inter-jurisdictional cooperation that will be needed to identify, locate, assess and return these children home” (Gilmore, 2021, paras. 10–12). In other words, reconciliatory gestures such as apologies must include meaningful financial and political commitments toward future policies and actions that result in redress, equity and justice for those harmed.

Truth and then reconciliation at the limits of settler colonialism

The mobilization of truth and reconciliation by the settler colonial state forces us to question their capacity to creatively build and envision decolonial Indigenous futures.

George (2020, p. 108)

While many Canadians have largely accepted symbolic forms of redress, such as government apologies, many remain aloof—even hostile—to calls for contemporary justice and equity (McCready, 2009). For example, when former Conservative Senator Lynn Beyak stood up on behalf of settler colonialism to mount an abhorrent defense of the Residential Schooling system in the Canadian Senate, many Canadians wrote to her office in support of her racist beliefs (Howell and Ng-A-Fook, 2022). These letters, which were published on her Senate of Canada website expressed “harmful anti-Indigenous stereotypes and tropes of an imagined ‘lazy Indian who doesn’t pay taxes,’ the ‘corrupt chief who misspends federal dollars,’ and the ‘chronic whining of people who can’t get over the past’” (Howell and Ng-A-Fook, 2022, p. 11). It took 2 years for the Senate Ethics commissioner to order the letters removed, and a further 2 years for Beyak to resign (Tasker, 2021).

Residential School denialism and its denialists, such as but not limited to Senator Beyak, is not limited to politicians. “Residential school denialists,” write Heath Justice and Carleton (2021) “include missionary apologists, writers and academics, right-wing and anti-Indigenous editorialists and relatives of residential school staff who uncritically refer to personal memory and work to defend their family reputations” (para 7). Justice Murray Sinclair has said that residential school denialism in Canada is on the rise, cautioning that different political and/or educational stakeholders are “rushing reconciliation and leaving truth behind” (Heath Justice and Carleton, 2021, para. 9). Consequently, as Heath Justice and Carleton (2021) reminds us, truth must come before we can address reconcilia(c)tions together inside, or outside, the contexts of the public schooling curriculum.

³Please note that the Indian Residential Schooling System is capitalized and referred to as a schooling system throughout the article to place emphasis on the fact that it was a system, with systemic, intergenerational, and ongoing impacts on First Nations, Inuit, and Métis survivors, families, and communities.

Beyond apologies: truth before reconciliation within higher education

The context of reconciliation has created an ambivalent opportunity for addressing the enduring coloniality of Canadian higher education.

Stein (2019, p. 168)

We are now close to 7 years since the close of *Canada's Truth and Reconciliation Commission* (TRC), and currently, only 11 of the 94 Calls to Action have been completed (Jewell and Mosby, 2021). Moreover, despite the recent litany of apologies, public outpourings of grief, the half-mast flags, and the establishment of a National Day of Truth and Reconciliation in 2021, settler colonialism continues to pervade political, social, and legal aspects of Canadian public policy and parlance. In fact, our apologetic Prime Minister spent the first National Day of Truth and reconciliation on the beaches of Tofino, British Columbia, rather than with residential school survivors and communities. He subsequently apologized for this decision, explaining that he made a regrettable mistake (Tunney, 2021).

Systemic changes are needed to move beyond the age of apology (Blackstock, 2021; Joseph, 2018). One has to look no further than to the vast overrepresentation of First Nations, Inuit and Métis peoples who are incarcerated, impoverished, food insecure, un/underemployed, and affected by suicide, violence, the child welfare system, addictions, and intergenerational trauma caused by colonialism to understand this. Chief Commissioner Murray Sinclair has often called education the "key to truth and reconciliation" stating that education is both the cause for, and at the heart of, addressing "truth," and sustaining "reconciliation" across the school curriculum in Canada (TRC, 2015). Education has therefore once again become the site where transformative change might occur. As non-Indigenous teacher educators and researchers, how the TRC *Calls to Action* for curricular and pedagogical transformation are being addressed, or not, within Faculties of Education is a significant ongoing inquiry for us to question, deconstruct, and reconstruct together.

Since 2015, universities, school districts, schools, education workers, teachers, and administrators have mobilized to respond to the Calls put forth by the TRC, specifically calls 62 and 63, which directly call upon provincial and territorial ministries, faculties of education, and K-12 administrators and teachers to integrate Indigenous knowledge and pedagogies across the school curriculum and teacher education programs. Although many provinces and territories have implemented curriculum that responds to the TRC Calls to Action (Kairos, 2018), educators often report that they do not have the skills, knowledge, or confidence to teach about the history of the Indian Residential Schooling system, Indigenous knowledges, or reconciliation (Dion, 2014; Howell, 2017; Madden, 2019; Smith, 2017). Recognizing that teacher education is crucial in this process, faculties of education across the country began to make commitments toward addressing truth, and then reconciliation (Cote-Meek, 2018; Madden, 2019; Universities Canada, 2015). Many of these commitments have included mandatory teacher education courses in First Nations, Inuit, and Métis perspectives, as well as recruiting and supporting Indigenous faculty, increasing Indigenous knowledge in courses, and in addressing institutional racism and settler privilege (Association of Canadian Deans of Education, 2017). Subsequently, a new field of study and research in truth and reconciliation education has emerged, led by Indigenous and non-Indigenous scholars, researchers, and teacher educators in areas of curriculum, teacher education, historical consciousness, Indigenous education, and teacher professional learning. We will examine some of the research that has emerged from this field in recent years later in this paper.

Despite the ongoing work of educators and scholars, settler colonial conceptions of reconciliation remain contested by several Indigenous scholars, individuals, and communities because of the ongoing daily non-Indigenous institutional, societal, and individual acts of anti-Indigenous racism (Coulthard, 2014; Refugee research, 2017; Vowel, 2016; Wakeham, 2019). Teachers and leaders in educational institutions must therefore continue to question and address how teacher education programs continue to be largely framed by settler colonial worldviews, histories and perspectives (Howell et al., 2021). In this section we briefly describe some of these limitations.

#Reconciliation: not a lesson plan

Reconciliation is more than a single event. To be fully realized, everyone will need to engage in genuine forms of learning, relationship building, and advocacy.

MacDonald and Markides (2018, p. 230)

Marie Battiste a prominent Mi'kmaq scholar in Canada, insists that pervasive of Eurocentrism within the higher education and public schooling system facilitates the exclusion of Indigenous peoples. In *Decolonizing Education: Nourishing the Learning Spirit*, Battiste (2013) calls on Settler Canadians to:

... imagine the consequences of a powerful ideology that positions one group as superior and gives away First Nations peoples' lands and resources and invites churches and other administrative agents to inhabit their homeland, while negating their very existence and finally removing them from the Canadian landscape to land no one wants. (p. 23)

The epistemological and material legacies of a settler colonial ideological state apparatus continue to reproduce and sustain national myths here in Canada, such as but not limited to “multiculturalism, peace-keeping, socially-progressive politics, and hard-earned prosperity” (Davis et al., 2017, p. 44). Non-Indigenous Canadians citizens are able to put forth stories within the public school curriculum that continue legitimize the intergenerational privileges we have incurred as settler beneficiaries (Regan, 2010). In turn, settler colonial “benevolent” and “paternalistic” stories continue to persist in our history curriculum here in Canada. They persist in government policies and politics of recognition directed at First Nations, Métis, and Inuit communities (Coulthard, 2014). It persists for several Canadian citizens in our historical public settler consciousness (Carleton, 2021; Howell and Ng-A-Fook, 2022). How might we then, challenge such historical accounts in ways that seek to trouble the fetishization of such settler colonial “benevolence” in relation to how each of us has, and continues, to benefit from such broken promises? To do so, as Battiste (2013) maintains, requires meaningful systemic educational reform that confronts the “hidden standards of racism, colonialism, and cultural linguistic imperialism in the modern curriculum” (p. 29). Our commitments toward truth and reconciliation often neglect these necessary confrontations, focusing instead on abstract notions of ways to “decolonize” and “indigenize.”

In response, Tuck and Yang (2012) remind us how many of the current conceptions of decolonization continue to be put forth as a metaphor that enable settlers to “equivocate contradictory decolonial desires” that turns “decolonization into an empty signifier to be filled by any track toward liberation” (p. 7). Likewise, Hare (2020) stresses that reconciliation in teacher education must challenge conceptions of a professional settler consciousness and move teacher candidates toward action and accountability. Otherwise, as she cautions, reconciliation will remain a “trendy topic as it has been cast in social media and scholarly writing” (p. 23). Similarly, Madden (2019) draws our attention to the hashtag “#ReconciliACTION” (p. 285). She reminds us that the TRC *Calls to Action* cannot be reduced to pedagogical approaches or “best” teaching practices, but rather a multi-dimensional approach that critiques the “construction and enactment of reconciliation” (p. 286).

In “Teaching truth before reconciliation,” Jurgens (2020) stresses that “histographies of Indigenous Nations are severely impeded by the colonial project ... within schools, millennia of Indigenous histories remain forgotten, positioned as bygone relics, as prehistory, or as folktales deemed irrelevant” (p. 123). Jurgens reminds us that educational institutions themselves bear responsibility for (re)righting these “historical amnesias” to move toward a critical historical consciousness in schools that disrupts the status quo, and whereby educators discuss “settler colonialism, Eurocentrism, racism, gender violence, and white supremacy” in their classrooms (p. 129). How might educators unlearn and learn to identify and name ongoing colonialism in the justice system, healthcare system, child welfare system, education system, and connect these abuses with past institutionalized violence toward Indigenous peoples? Here Jurgens cautions,

When we do not educate to get to the root of the Canadian problem, we foreclose opportunities to come to a true understanding of our past ... Working toward reconciliation means the classroom discourse must center on unpacking these issues underpinning the continual reproduction of harms against Indigenous peoples. (p. 130)

The thinking that these scholars bring forth teach us that the work of disrupting, unlearning⁴ and learning settler colonial world-views as part of our teacher education curriculum is not simply about transforming teaching practices, embracing decolonization strategies, or committing to certain reconcilia(c)tions. In the next section, we discuss what we have learned from some of the research done within Faculties of Education across Canada.

What we have learned: the perfect stranger and the contradictions of Canadianness

Learning about settler colonialism as an ongoing structure and set of inequitable relations is akin to coming out of a fog, where settlers begin to realize that Indigenous people have been present all along, in our schools, neighbourhoods, and cities but we settlers could not (would not) see all that we did not know. It is hidden from us and we hide it from ourselves.

Rice et al. (2022, p. 23)

Long before the TRC closing ceremonies and the Calls to Action, there were teachers and teacher educators across Canada committed to disrupting the normative narratives of Canadian history in their classrooms. Much of this early work focused on understanding the obstacles that teachers faced when learning about Indigenous perspectives and history. From this early work, a growing body of research emerged on what is often termed “teacher resistance” in regards to teaching Indigenous content and perspective (Aitken and Radford, 2018; Dion, 2014, 2016; Rice et al., 2022; Tupper, 2011, 2012). Several studies identify barriers for teachers doing reconciliation work, including a lack of confidence, perceived absence of resources, minimal time, curriculum restraints, and fear of offending and fear of cultural appropriation (Dion, 2014; Howell, 2017; Smith, 2017).

⁴While several institutions across Canada are calling for the “decolonizing” and “indigenizing” of “the academy” (Gaudry and Lorenz, 2018), these terms are both ambiguous, intricate, and raise many questions. Is it possible for Canadians to “decolonize” while living on, and profiting from the lands many of our relatives recently colonized? Moreover, what does it mean to “Indigenize” and who is doing the indigenizing? In our view, the concept of “unlearning,” as a process toward truth, and then, reconciliation, is a more explicit and accurate description of the work ahead of us. It draws attention that the work we must do is about us.

Susan Dion is a Potawatomi Lenapé scholar who considers the resistances among settler educators to teaching Indigenous perspectives and how they are revealed. After extensive work with teacher candidates, [Dion \(2016\)](#) put forward what she calls, “the allure of the perfect stranger” to explain teacher resistance (p. 178). Dion posits that when faced with teaching Indigenous perspectives, teachers often insist:

I can’t teach this content. I know nothing about Indigenous people, I have no friends that are Indigenous, I didn’t grow up near a reserve, I didn’t learn anything when I was in school. I am a perfect stranger to Indigenous people. (p. 178)

The perfect stranger positionality permits, as [Dion \(2016\)](#) stresses, teacher candidates to excuse themselves of responsibility and prevents them from feelings of discomfort. Furthermore, staying within the space of the perfect stranger enables teacher candidates to remain respectful, hardworking, and benevolent Canadians. Indeed, narratives of “Canada the Good” provide the foundation for how Canadian “students read and racialize the story of the territory on which they live and their relationship with First Nations peoples” ([Tupper, 2011](#), p. 41). For many teacher candidates, these narratives have been upheld and validated by the curricular and epistemological exclusion, nullification, and dismissal of Indigenous peoples throughout their years in the Canadian schooling system. Thus, the identity of the “perfect stranger” is formed and informed by the narratives we learn, and don’t learn throughout our lives.

Consequently, teacher candidates feel entitled to absolve themselves of responsibility toward teaching Indigenous perspectives and remain isolated from Indigenous people. Moreover, by assuming the role of the perfect stranger they avoid facing the contradictions of their histories as Canadians. Donald (personal communication, February 16, 2019) explains:

If somebody has a Canadian identity, and that’s how they understand themselves, and they look at an Indigenous person, then part of the acknowledgment is that the Indigenous person is from here. They have deep roots in this place ... So with that admitted, then that means that “Canadian” must be foreign to this place. And that’s a very strange contradiction, because how can a Canadian be a foreigner in Canada? This results in a “psychosis-like state” where Indigenous people can’t possibly be seen as in relation to Canadians.

The contradictions within such intergenerationally inherited and sustained beliefs about what it means to be “Canadian” challenge our status quo of comfort and privilege. [Brant \(2017\)](#) identified several ideologic barriers among the teacher candidates she interviewed. She found “a pedagogy of Whiteness which manifests itself as a challenge to mandatory Indigenous education and an active distancing in attempts to absolve oneself of responsibility in relation to Indigenous peoples” (p. 41). In turn, as Brant reminds us, this not only caused serious impediments to reconciliatory efforts within teacher education, they also risked “impeding further reconciliation in all future educational spaces” (p. 41). In [Aitken and Radford’s \(2018\)](#) research with teacher candidates at the University of Ottawa and Bishops University, proclivities to protecting whiteness and defending Settler identity were apparent in several ways. When teaching about the Indian Residential schooling system, for example, teacher candidates focused on “respect and sensitivity toward their own students, rather than the victims of colonization” (p. 45). Furthermore, teacher candidates suggested that the best ways to go about teaching “truths” and “reconciliation” was through the non-confrontational transmission of information and facts, the use of neutral language, and by “making it lighter” (p. 45). Teacher candidates spoke passionately about the importance of “avoiding approaches that would elicit emotions, particularly shame and guilt” in their students (p. 45). Moreover, their focus on knowing what to do, rather than needing to learn, is an important finding.

For [Watson and Currie-Patterson’s \(2018\)](#), their teacher education students wanted to learn about Indigenous peoples rather than learning about their own colonialism. “Students appeared to be preoccupied,” they tell us, “with ‘the cultural other’ and how to ‘deal with’ the other in the classroom” (p. 366). Similarly, in [Howell’s \(2017\)](#) research, teachers expressed comparable resistances and rhetoric in statements such as “no one taught me how to teach this” (p. 89). And, “I just don’t have the resources to teach it” (p. 101). The perfect stranger was also invoked when teachers spoke of the “fear of offending ... as this history is not my own” (p. 102). Such truth and education research demonstrates that fear, discomfort, and colonial logics are substantial impediments to teacher candidates unlearning colonialism. This will affect how, and if, they take up the relationships between Indigenous peoples and Canadians in their own classrooms.

In the next section, we examine responses to the concerns that this research has revealed. How might teacher educators work to unsettle the colonial blockages that are occurring in teacher candidates? What are the pedagogical and curricular choices we can make that might challenge resistances and provoke curiosity, relationality, and openness to unlearning?

Toward understanding colonialism as culture, unlearning and ethical relationality

The journey towards reconciliation begins with listening—not in a reactive or shallow way that results in guilt or outrage but in a deeply reflective way—where the listener continually asks the question: what action can I take to reconcile?

Poitras Pratt and Danyluk (2019, p. 8)

We have suggested that settler colonialism and its psychosis of denial, as a cultural, pedagogical, curricular practice, pose a serious challenge to the existing historical consciousness and worldviews of teacher candidates. “If teacher education systems in Canada continue to rely on existing dominant knowledge systems and governing structures to respond to the Calls to Action,” state Daniels et al. (2018) “they will fail to address them in the spirit and intent with which they were issued” (p. 202). We suggest that the spirit and intentions of the TRC *Calls to Action* (2015) could be enacted within a teacher’s professional standards of practice and ethics of care when Faculties of Education begin to address ethical relationality as part of our professional and personal curricular and pedagogical inquiries. Donald (2009) describes ethical relationality as:

... an ethic of historical consciousness. The ethic holds that the past occurs simultaneously in the present and influences how we conceptualize the future. It requires that we see ourselves as related to, and implicated in, the lives of those that have gone before us and those yet to come. It is an ethical imperative to recognize the significance of the relationships we have with others, how our histories and experiences are layered and position us in relation to each other, and how our futures are similarly tied together. (p. 7)

There are many curricular choices that teacher educators can make when attempting to address “truth,” and then “reconciliation,” across their teacher education programs (Brant-Birioukov et al., 2020; Madden, 2019). As Mitchell and Tupper’s (2017) research illustrates, when teachers experience “beyond the classroom” relational opportunities for learning, they are encouraged to “contextualize colonial events and policies beyond residential school experiences as isolated events” (p. 11). Teacher Education and its respective curriculum inquiries grounded in ethical relationality appear to increase the affective engagements that enable teacher candidates to visualize themselves in relation to people and places, “moving past the assignment of guilt to a consideration of present-day responsibility” (Mitchell and Tupper, 2017, p. 11). In turn, Mitchell and Tupper describe a noticeable increase in meaningful learning when teachers have opportunities to visit former residential school sites, meet with Elders and survivors, hear stories of Indigenous resistance and resilience, and “overtly learn about whiteness and its restructuring forces” in order to make explicit what often remains invisible (p. 20). Mitchell and Tupper noted that “critical consciousness was fostered through their (the teachers’) engagement with colonialism ... in effective, meaningful ways as opposed to traditional practices that had left them believing they had ‘learned this already’” (p. 17).

Likewise, Smith and Ng-A-Fook (2017) discovered that when teacher candidates were able to speak and listen to Elders and Residential School system survivors, they became “historical subjects during the encounters with the past lives of others ... learning how to reread, rewrite, and redress a more nuanced storied account” (pp. 81–82). During this oral history project, teacher candidates were called upon by Elders’ restorying to unlearn the different curricular ways in which settler colonialism has framed our historical consciousness and in turn the stories we teach ourselves about being “good” Canadian citizens. Yet, emotional responses to the stories of survivors and Elders alone do not facilitate change in teacher candidates (or in any of us). To become agents of change, we need to not only *feel* the weight of historical and contemporary injustices, we must also recognize ourselves as *implicated* in the relationships and in terms of the professional and personal responsibilities that such renewed relationships involve (Brant-Birioukov et al., 2020).

Rice et al. (2022) found that when engaging Indigenous and non-Indigenous participants in collaborative story-telling, it was important to “scaffold spaces for listening differently ... by creating opportunities for settlers to listen and learn from Indigenous perspectives, they became better equipped to revise their relationalities with Indigenous peoples” (p. 21). Teacher education programs cannot only be concerned with teacher candidates learning about the truths that the TRC final report revealed, but also in terms of “how they might be prepared to take up the responsibility of reconciliation in their own teaching practices” (Aitken and Radford, 2018, p. 42). Aitken and Radford’s research suggests that the opportunities for responsibility and relationality are nurtured when teacher candidates are given

... extended periods of time in a course for bearing witness to others’ testimonies of loss, studying the historical context of residential school and cultural genocide, being called on to create learning situations for the greater public, as well as thinking about future students. (p. 47)

Encouraging teachers to engage in ongoing reflective writing, whether it is the use of extensive digital blogging (Aitken and Radford, 2018), letters to survivors after hearing testimonies (Howell, 2017; Smith, 2017) or settler life writing (Tupper, 2019), holds possibilities for reckoning, revisiting, unlearning, and learning anew. As scholars and teacher educators we recognize that such pedagogical and curricular unlearning represents privileged professional learning for us, or a potential transformation of our settler colonial historical consciousness, but does not necessarily address or change the actual ongoing lived experiences for First Nation, Inuit, and Métis communities. And yet, for several teacher candidates, such calls toward unlearning within teacher education programs, might be the first time they have been invited to question their complicity with colonial systems and its intergenerational violence. Unlearning occurs through confronting settler colonialism, deconstructing and reconstructing our collective historical consciousness, and positioning ourselves in relation the both.

Professional unlearning opportunities: truth and then reconciliation with teachers

... pedagogical approaches that aim to transform Indigenous-settler relations must engage with and unsettle white settlers’ emotional attachments to dominant narratives of Canada and to their own kinship stories of origins, and call into question their assumed right to material benefits accrued from colonization.

Rice et al. (2022, p. 16)

The TRC *Calls to Action* initiated the unprecedented development of teacher resources aimed at teaching toward reconciliation. However, there is an absence of professional learning opportunities for practicing teachers (Blackstock et al., 2018). Most existing professional learning opportunities are offered through teachers' unions and focus on resource sharing and workshops. For example, the Elementary Teacher's Federation of Ontario (ETFO) offers online education resources and workshops. Such resources support their members in "learning instructional practices to integrate Aboriginal content and perspectives in a positive approach and ensure that First Nations, Métis and Inuit people's issues and worldviews are authentically reflective and connected to the content at hand" (n.d.). Likewise, the Alberta Teachers Association (ATA), the BC Teacher's Federation (BCTF) and many others offer similar workshops and resources for teachers. Many other organizations across the country provide professional learning for teachers, such as the First Nations Child and Family Caring Society (Caring Society), The Royal Canadian Geographic Society, Legacy of Hope, and Project of Heart,⁵ to name a few (Howell, 2017). However, there is scant research on the impacts of these truth and then reconciliation professional learning opportunities, and many teachers continue to feel that they have "so many resources but not enough knowledge, time or understanding" (p. 132). Below, we describe research currently being conducted that seeks to reframe how teachers learn about and teach toward truth and reconciliation in their classrooms.

Since September 2018, we have been researchers on the Social Sciences and Humanities Research Council (SSHRC) funded project called, *Just Because we're small doesn't mean we can't stand tall: Reconciliation education in the elementary school classroom*. The research seeks to understand better the impacts of reconciliation education on students' and teachers' experiences, with a goal of improving teacher professional learning. The research team is a multidisciplinary partnership between the University of Ottawa's Faculty of Education and the Caring Society. Through our partnership, we have engaged teachers in numerous professional learning opportunities, such as resource development and facilitation, and the Spirit Bear Retreat for Teacher Professional Learning which was held in August of 2021. During the 2-day virtual retreat, participants learned from several First Nations, Inuit, and Métis scholars, students, and activists who focused on building and restor(y)ing Canadian-Indigenous relations. In a research report recently published (Howell and Brittain, 2022), feedback from educators who attended the retreat reveals the transformative nature of teachers experiences:

I just wanted to take a moment to tell you how deeply moved and impressed I was by what was shared at the retreat. I learned so much. It was an open-hearted, open-minded, movement to reflecting and respecting the wisdom of Indigenous Elders while acknowledging the limitations of being mired in the context of current colonized, westernized school structures. It renewed hope. It was nothing short of transformative.

Professional learning opportunities for teachers such as the type of complex engagements that Hare (2019) maintains have the potential to reduce the proximity of space in relationships between Indigenous peoples and Canadians. Moreover, Hare stresses that rather than create professional knowledge that perpetuates superficial understandings, teacher educators must invite them to engage in complex pedagogical spaces that nurture reflexivity. The work and research we are engaged in with the Caring Society nurtures complexity by welcoming teachers into a meaningful, sustained professional learning community called the Spirit Bear Virtual School for Teachers. The Spirit Bear school provides opportunities for teachers to learn from First Nations, Inuit, and Métis peoples, unlearn colonialism, engage in holistic pedagogies, and co-create learning resources based on their lived experiences with students in their classrooms.

Restorying truths and then reconcilia(c)tion as future educational research

At different universities across Canada, we are taking small steps towards bridging our relations across such distances. And one small step calls on us to re-story the narrative compositions of historical injustices within teacher education.

Brant-Birioukov et al. (2020, p. 127)

As academic institutions that seek and share knowledge and truth as their *raison d'être*, universities are inherently implicated in the reproduction, or the unsettling, of how we ethically situate ourselves. In an ideal world, an increased level of awareness would prompt the deliberate and strategic prioritization of Indigenous perspectives in post-secondary settings.

Poitras Pratt and Gladue (2022, p. 114)

When educators honor the historical and contemporary possibilities of truth and then reconciliation education, it provides a strategic curricular and pedagogical move toward re-storying our collective pasts in a way that both strengthens Indigenous communities and politicizes the nation-state's settler colonial creation stories as ones of forgetting as much as remembering selective historical truths (see Brant-Birioukov et al., 2020; Donald, 2019; Stein, 2019). Our research team at *A Canadian Curriculum Theory Project* is current collaborating on several different federally funded research projects that are committed to extending promising

⁵Project of Heart is an arts-based inquiry project that facilitates learning about residential schools through research, connecting with survivors, and social justice actions. Thousands of Canadians across the country have taken part since its creation in 2007 by Ottawa teacher Sylvia Smith and her students.

practices toward truth, and then reconciliation education research as an emerging field of study. Importantly, all projects seek to unlearn and learn with and from Indigenous Peoples.

For example, *Mobiliser les histoires autochtones pour le changement social* | Building Connections: Mobilizing Indigenous Histories for Social Change sought to learn more about the processes of revitalization from different international Indigenous scholars, community leaders, Knowledge Keepers, and Elders who in turn have developed their own history and educational memory projects. This recorded speakers series sought to mobilize the knowledges and experiences of Indigenous communities and settler institutions to identify promising practices for the development of transformational approaches to re-storying Indigenous histories in relation to history education both inside and outside of a settler colonial schooling system.

Another project, *Co-Curricular-Making: Honoring Indigenous Connections to Land, Culture, and the Relational Self* is a national partnership grant between First Nations communities, Indigenous and non-Indigenous educational researchers who are collaborating to articulate reciprocal curricular pathways for educators and their students; to enhance understandings of Indigenous cultures and supports related to these groups; and to mobilize local, place-based, land-based First Nations ways of knowing and being. Part of this partnership project aims to study the curricular and pedagogical conditions that both challenge and sustain our capacities to participate in reconciling conversations, grapple with personal narratives, and foreground truth, and then reconcilia(c)tions inside and outside of our different teacher education programs.

Finally, Just because we're small doesn't mean we can't stand tall: Reconciliation education in the elementary classroom seeks to understand how teachers in the Ottawa-Gatineau region of Ontario/Quebec draw on the First Nations Child and Family Caring Society's (Caring Society) reconciliation-based campaigns in their elementary classrooms. We interviewed educators involved in the campaigns to examine the impacts such truth, and then reconciliation education has on elementary students and teachers. In turn, we are collaborating with the Caring Society, teachers, Elders, and Knowledge Keepers to co-create, support, and sustain a professional learning network for truth and then reconciliation education.

Certainly, there continues to be challenges and limitations toward the ways in which truth and then reconcilia(c)tion education and its research is conceived and lived across the different settler colonial educational systems. In terms of our research within the contexts of higher education, and more specifically teacher education, we continue to be implicated in the reproduction of settler colonialism even while attempting to unsettle taken-for-granted historical and/or contemporary truths. And yet, our research team remains committed as educational researchers, citizens, and fellow human beings toward working with First Nations, Inuit, and Métis peoples. Perhaps then we might move past an *Age of Apology*, and toward living, restorying and reimagining narrative compositions of past, present, and future relations as Indigenous and non-Indigenous citizens living on these lands.

Teacher education is a powerful socializing institution that shapes who K-12 educators are and how they approach teaching. In the United States, teacher education programs were established 200 years ago, in the 1820s, with the growth of normal schools. They were modeled after European teacher training institutions, guiding educators on how to engage students, utilize limited resources, and create a positive learning environment within the newly emerging systems of education (Ducharme and Ducharme, 2022). For many working class and students of Color, these education systems were designed as a form of control, socializing students to their place within the hierarchy of American society; and teachers were instrumental to this project (Gratz, 2009). In Nebraska, the Teachers' Committee was cited as stating,

How can we have a national spirit in a Commonwealth where there is an infusion of the language and blood of many nations, unless there is a very strong effort made to socialize the different elements and weld them into a unified whole? It therefore becomes evident how important it is that the teacher be an American in sympathy, ideals, training and loyalty.

Gratz (2009, p. 55).

They were calling for teachers who embodied nationalism and assimilationist goals. By the mid-20th century, normal school teacher training programs had expanded into 4 year colleges and universities across the nation (Ducharme and Ducharme, 2022).

In 2022, where over half of public school students in the nation are students of Color, teacher education programs carry many of the same principles and structures of their origins. Today, 70% of teacher candidates, 87% of adjunct instructors, and 91% of tenured/tenure track instructors are white (King and Hampel, 2018) and predominantly monolingual, and teacher education programs continue to be critiqued for maintaining and reproducing whiteness. Scholars such as Sleeter (2001, 2016), Cross (2005), and Souto-Manning (2019) have argued of an ever-present whiteness in teacher education, where programs are complicit in "White ways and systems of knowing which ... further White interests through the invisibility and/or normalizing of systemic racism" (p. 100). And while this manifests through student resistance or teacher educator race-evasiveness, it is important to understand the complexity of racism in teacher education as a structural issue (Kohli and Pizarro, 2022).

Kohli et al. (2021) argue that there must be a systematized effort to address racism and whiteness within the multiple facets of teacher education, from admissions processes and the recruitment of teacher candidates, to the curriculum and pedagogy of coursework, field placements, and the retention of teacher candidates of Color. Building from higher education research on racial climate, they offer a five dimensional model for a healthy racial climate in teacher education programs, that includes a shift from a race-evasive approach—where programs ignore and invisibilize the prevalence of racial inequity and racism—to one of racial literacy—where program leaders, teacher educators, and teacher candidates are able to effectively identify racism and are committed to disrupting it. In this entry, we build upon this model and posit that for teacher education programs to become pivotal spaces of change and transformation they must operate in ways that embody racial literacy.

Racism and race-evasiveness in teacher education

Teacher education has historically been complicit in upholding and maintaining forms of racism through the policies and practices it enacts. Today, rather than overt discrimination, teacher education engages in subtle and more sophisticated practices that are just as effective in maintaining the racial status quo of white superiority and dominance (Bonilla-Silva, 2018). One of the primary tools

to upholding the racial status quo is what Bonilla-Silva labeled color-blindness,¹ and what we refer to as race-evasiveness—claims of “not seeing” race as a central issue that directly impacts the lives of people of Color. Instead, this race-evasiveness shifts the blame onto historically marginalized people of Color for their lack of “success” or achievement, while rendering the oppressive role of systemic and institutional forces as invisible. In this section, we point to how racism and persistent whiteness is maintained in teacher education programs through race-evasive approaches to curriculum and white student resistance, resulting in the (re) production of a predominantly white teaching force and dominant ideologies of whiteness.

Race-evasive curriculum in teacher education

Although many teacher education programs espouse the value of developing teachers who are committed to enacting social change in their classrooms, there appears to be a clear disconnect between this rhetoric and the actual practices of these programs. The use of terms such as “diversity,” “multiculturalism,” and “inclusion” often prevail within teacher education, obscuring the pervasive forces of whiteness, racism, and power that shape policies and practices across the educational system (Cross, 2005). Thus, while teacher education programs may emphasize developing teachers who are critically attuned to issues of educational in/equity in their mission, many of these programs often privilege white, middle-class norms and values (Marom, 2019) while simultaneously erasing the histories, perspectives, and contributions of teacher candidates of Color (Brown, 2014; Gomez et al., 2008; Nguyen, 2008).

For example, most teacher education programs are required by credentialing entities to attend to racial, cultural, and/or linguistic diversity. However, they often present these topics in a shallow manner, frequently held in one “multiculturalism” course, and absent an analysis of power (Amos, 2016; Sleeter, 2001). Sleeter (2016) asserts that separating “diversity” into one course within a teacher education program “limits how teacher preparation programs are holistically designed to prepare teachers for the diverse students in schools.” (p. 5). Additionally, Gorski (2009) found that while these “diversity” courses were designed to prepare teacher candidates’ cultural sensitivity, tolerance, and multicultural competence, in an analysis of multicultural course syllabi, the majority of them “failed to frame multicultural education as a political movement concerned with social justice, as an approach for comprehensive reform, as a critical analysis of power and privilege, or as a process for eliminating educational inequities” (p. 316).

This race-evasive approach to the content of teacher education results in teacher candidates with little awareness surrounding issues of discrimination and racism, how these issues manifest and operate with schools and society at large, and how these forces are reproduced in day-to-day life (Sleeter, 2008). When unchallenged, beliefs in meritocracy and individualism also uphold a myth of equality that can result in deficit thinking of students of Color, blaming them for their “failures” in schools (Cherng and Halpin, 2016; Sleeter, 2008; Tenenbaum and Ruck, 2007; Valencia, 2010). Thus, as programs engage in race-evasive practices, clustering content about race, culture, and language into one course without limited structural analyses, they stunt teacher candidates’ needed capacity to read racism, understand its impact, and disrupt its harm (Sleeter, 2001; Picower, 2009).

Race-evasive approaches to white student resistance in teacher education

While teacher education programs have attempted to recruit more teachers of Color into their programs, they ultimately fail to adequately address and combat the pervasive culture of whiteness embedded within their programs, thus disproportionately centering the needs and comfort of white students (Brown, 2014). This results in teacher candidates of Color being rendered to the margins and frequently subjected to racism throughout their programs and student teaching placements from peers, instructors, and school placement staff (Kohli, 2021; Rodriguez-Mojica et al., 2020). For instance, the Latinx students in Irizarry’s (2011) study were silenced by culturally insensitive white professors in their teacher education courses, and expressed feeling marginalized, rather than valued, within the teacher education community. Teacher candidates of Color who do feel comfortable enough to share their opinions in their classes have felt that their white peers do not take them seriously, were rendered irrelevant (Amos, 2010), and were fearful of further ostracization from their white peers (Amos, 2010, 2016). Similarly, Chinese-American students in Hernández Sheets and Chew’s study (2002) resorted to silence in order to cope with the discomfort they felt as a result of the disparaging comments made by White students in their classes. This frequent silencing and fear of retaliation from White students results in teacher candidates of Color forcibly assimilating to the whiteness of their program in order to complete it (Amos, 2016). Other teacher candidates seriously consider leaving their programs, or are pushed out altogether (Kohli, 2018, 2021).

Within majority white teacher educators and administrative leadership, when programs try to present a more critical focus, it is typically teacher educators of Color hired to supplement the race-evasive curriculum (Kohli and Pizarro, 2022; Ladson-Billings, 2005). As teacher educators of Color teach about race and racism, white teacher candidates enact numerous strategies of resistance (Amos, 2016; Chang-Bacon, 2021). Research has shown that they discredit the impact racism has had on people of Color in the United States (Garrett and Segall, 2013), engage in emotional outbursts (Amos, 2010; DiAngelo, 2006; Hernández Sheets and Chew, 2002), and express anger in course evaluations (Truong et al., 2014; Graves, 2017; Han and Leonard, 2017). Scholars have argued that white teacher candidates use the anonymity of these evaluations to reaffirm their dominance and power in these programs (The Teacher of Color Collective and Souto-Manning, 2021) by questioning the competency, pedagogy, and emotional

¹We build from and honor the pivotal work of Bonilla-Silva (2018) to describe an avoidance discourse about race and racism as a mechanism that maintains racism. Critical disability scholars have argued that the use of the term “colorblind” is ableist, calling for more precision in our language (see Annamma et al., 2017). Aligned with their use of color-evasive, we use the term race-evasive (Harrison, 1998) as a more precise way to name this phenomenon.

stability of teacher educators of Color generally, and Black women teacher educators in particular (Evans-Winters and Twyman Hoff, 2011; Kohli and Pizarro, 2022; Sleeter, 2016).

While many white teacher educators and teacher candidates are enacting harm that impacts teacher educators of Color, teacher candidates of Color, and eventually K-12 students of Color, Kohli and Pizarro (2022) remind us that teacher education programs are making choices through their embedded policies and practices. They are actively admitting cohorts that lack diversity, have limited understandings of inequity, and often carry deficit frames of communities of Color. Thus, it is important to highlight how programs remain culpable in neglecting and perpetuating racial harm within their programs and in K-12 schools.

Racial literacy in teacher education

Given the clear prevalence of racism, whiteness, and the racial harm that is fostered through teacher education, Kohli et al. (2021) argue that to move toward a healthy racial climate in teacher education where the well-being of communities of Color is prioritized, programs must operate with racial literacy. Building from the work of Guinier (2004) and Twine (2004), we contend that racial literacy equips people with a set of discursive practices to name, critically analyze, and act upon the ways in which racism informs the structural, political, and economic circumstances of the US. Racial literacy involves the possession of a “racial grammar and vocabulary that facilitates a conversation about race, racism, and antiracism” (Twine and Steinbugler, 2006, p. 344) and is a practice that is continually taught and learned throughout the course of one’s life.

If teacher education programs want to produce a teaching force responsive to racial inequities, they must develop educators who are critically oriented, culturally sustaining (Paris and Alim, 2017), and are prepared to critique and take action against the racism within schools. The more experiences teachers have developing racial literacy, the more likely they are to create conditions in their classrooms and curriculum that are supportive of students of Color’s realities (Rogers and Mosley, 2008). However, for teacher education to be a lever of transformation and social change, Kohli et al. (2021) maintain that leaders must work toward not only developing the racial literacies of teacher candidates, but must also ensure that racial literacy is used to guide the various facets of the program. We argue that programs must actively support diversification and they must actively shift the ideologies taught and embodied in teacher education programs.

Teacher education programs must actively support diversification

US public schools were established and continue to exist as sites of racial inequity and racial harm, where students of Color have had their language, culture, and knowledge systems demeaned, ignored, or erased. Within this context, there have always existed teachers of Color who have resisted the assimilationist goals of schools and who have served as an important resource for students of Color and their families. It has been noted that teachers of Color are more likely to have high classroom expectations (Villegas and Irvine, 2010), create cultural bridges with families (Gomez et al., 2008), teach in culturally responsive and sustaining ways (Kohli, 2021), and recognize and resist racism (Villegas and Irvine, 2010)—all conditions that are supportive of the success and well-being of students of Color. For example, a Black student with at least one Black teacher is shown to have higher growth in their reading abilities and is less likely to be suspended or referred out of class (Lindsay and Hart, 2017).

Unfortunately, teachers of Color are underrepresented nationally, making up just over 20% of K-12 educators within public schools serving over 50% students of Color. Considering their significant role in the success of students of Color, yet their low representation in the field, the need to diversify the teaching force has come into focus for many teacher education programs. Undergraduate education programs should consider partnering with high schools and campus summer programs to create diverse pipelines; graduate programs should recruit from student organizations and majors that draw students of Color; and programs at both levels should provide resources that mitigate known barriers to their matriculations, such as supporting aspiring teachers through the prerequisites requirements and the high cost of tuition (Kohli, 2021).

Another proven method to building culturally responsive teachers into communities of Color is “grow your own” programs, which seek to build a diverse “homegrown” teaching force who are already committed to serving their communities (Haddix, 2017; Valenzuela, 2017). By providing a variety of financial, academic, and social supports to prospective teacher candidates who may otherwise be barred from joining the teaching profession, grow your own programs have been particularly successful at recruiting and retaining linguistically diverse, first-generation, historically marginalized teacher candidates of Color from local communities and schools (Gist et al., 2019). Grow your own programs emphasize equitable approaches and critical perspectives that combine the cultural wealth and knowledge of these prospective teachers, culturally responsive and sustaining practices, and social justice pedagogies (Valenzuela, 2017) to build the racial literacy of these teacher candidates. The combination of these practices can reduce high rates of teacher turnover in these areas, as developing teachers of Color are already familiar with the communities that they serve and can offer direct and tailored instruction to students that teachers outside the community may not be able to. As a result, students of Color in these schools have access to stable, experienced teachers who are committed to engaging them in sustaining ways, share similar backgrounds and experiences, and are deeply committed to their learning and well-being.

However, in a field where the majority of teacher educators and teacher candidates are white, and curriculum rarely interrogates oppression because it is structured to privilege white comfort, recruiting teacher candidates of Color into programs is not enough. As some programs have focused on diversifying their students, they have made very few other shifts, consequently enlisting already

minoritized educators into hostile climates not designed for their success. Thus, it is important for teacher education program leaders to establish and maintain learning environments that nurture the well-being of teacher candidates of Color.

Rather than viewing teacher candidates of Color as an additive change on top of existing structures that include predominantly white teacher candidates, programs need to re-think the overall composition of programs. The racial dispositions of peers have a great impact on the well-being of teachers of Color (and the well-being of K-12 students of Color); thus, to avoid harmful interactions, programs should consider “asset framing of communities of Color” a core competency for admissions. The structures of the program must also consider the epistemologies and ontologies of communities of Color, fostering a collaborative environment where teacher candidates are cultivated to collectively plan and see each other as resources in the profession.

To realize these goals, programs must ensure that teacher education faculty and teacher mentors are racially, culturally, and linguistically diverse; have advanced racial literacies; and are ready to actively resist harm. Programs must also be prepared to respond to racial harm as it predictably arises. In addition to having staff who competently teach about race and racism, programs must also have established policies, protocols, and practices to directly address racial injustice within courses, in school placements, and between students and/or staff.

Teacher education programs must actively shift their ideological commitments

Traditional forms of curriculum in teacher education programs often center technical forms of teaching rather than fostering environments for students to engage in critical conversations surrounding race, power, and other forms of injustice in schools. Yet, if teacher education programs are truly committed to serving as levers of transformation, in addition to actively supporting diversification, they must also shift their ideological commitments. This can occur through the implementation alternative forms of critical curriculum and pedagogy, offering students access to critical theory, readings from theorists who are Black, Indigenous, and people of Color, and experiences that explicitly strengthen their skills to navigate the racial climates of K-12 schools. Rather than reinforcing race-evasive perspectives rooted in whiteness, these critical pedagogical approaches are anchored in visions of justice, equity, and the belief that education is inherently political (Souto-Manning, 2010), and thus require that teacher education programs build upon the strengths, backgrounds, skills, and knowledge of communities of Color. Two such examples are culturally sustaining pedagogies and community-based teacher education.

Culturally sustaining pedagogies (CSP) seek to “preserve and maintain linguistic, literate, and cultural pluralism as part of the democratic project of schooling” (Paris, 2012, p. 95). In doing so, CSP has the power to transform the practice of teaching so that teachers entering classrooms treat their students of Color with dignity and actively work to sustain their strengths, humanities, and communities. Adopting CSP in teacher education requires programs to actively assess if their teacher candidates are teaching in ways that are culturally sustaining toward students and communities of Color, or if they are continuing to produce teacher candidates who view these communities from deficit perspectives (Ladson-Billings, 2017). The ultimate goal of implementing CSP in teacher education should be to develop teachers who are racially literate and who are actively empowered and well-equipped to cultivate racial literacy among their future students; this should result in moving their students to take action against the injustices present in their daily lives. Further, by centering elements of CSP within their programs, teacher education programs can also sustain the assets and humanities of teacher candidates of Color and cultivate their racial literacies, rather than continuing to render them to the margins of their programs.

An additional approach that has the potential to shift the ideological commitments of programs is community-based teacher education, which seeks to prepare future teachers to work in historically marginalized communities. Community-based teacher education builds partnerships between universities, communities, and schools to develop teachers who are equity-focused, critically conscious, and socially just (Zygmunt and Clark, 2021). Teacher candidates work in solidarity with members of the community to understand issues of inequity that impact the schooling contexts they are a part of. As they immerse themselves in the community, these prospective teachers learn to “understand systems of power and privilege and are compelled to work collaboratively toward a socially just society in order to rectify conditions that disadvantage populations of children” (Zygmunt and Clark, 2021, p. 5). With the proper support, teacher candidates and community members can work together to actively take action against the injustices and inequitable conditions that disadvantage students in schools.

Discussion

Teacher education programs continue to implicitly replicate whiteness since their inception more than 200 years ago, much to the detriment of communities of Color. While forms of racism are less explicit now than before, racism is still deeply embedded within the policies and practices of teacher education, ranging from admissions processes to the centering of whiteness in curriculum and subsequent replication of ideologies rooted in white supremacy. These practices that maintain racial inequities in both teacher education programs and K-12 schools are maintained through pervasive forms of race-evasiveness, where teacher educators and program leaders overlook their roles in the reproduction and development of predominantly white, monolingual teachers who lack necessary skills to interrogate systemic racism.

To maintain a healthy racial climate where teachers of Color, teacher educators of Color, and K-12 students of Color are not continuously harmed by race-evasive practices, teacher education programs must make significant structural changes that intentionally cultivate racial literacy among faculty, staff, and teacher candidates. These structural changes must ensure that all teacher

education faculty share the responsibility of reflecting on and challenging racism, and support students of Color as they navigate these programs. This begins by requiring faculty and program leadership to understand the historical and contemporary experiences and strengths of communities, teacher candidates and faculty of Color. Racial literacy should also be a core competency for new faculty hires, evaluated through rubrics that gauge understandings of structural racism and a commitment to challenging it. In addition, racial literacy growth should be part of the evaluative process for all staff, faculty, and administrators in teacher education (Kohli et al., 2021).

Teacher education programs that seek to prioritize the racial literacy development of their teacher candidates must critically assess how they prepare their candidates to teach in liberatory ways for racial and social justice, rather than continue to view communities of Color as deficient and in need of “fixing.” Cultivating racial literacy in teacher candidates requires them to be able to identify, respond to, and counter forms of racism that they might encounter in a variety of contexts (Price-Dennis and Sealey-Ruiz, 2021). Teacher education programs must provide candidates with the space and support to critically discuss and reflect on their experiences with race, racism, and power, and interrogate how these forces shape the schooling contexts they are a part of. As teacher education programs assist teacher candidates in the process of cultivating their racial literacy, they become equipped with the “skills to use the power they have and the agency they will need to examine and discuss race and racism, to adopt anti-racist stances ... and to disrupt racialized educational inequities” (Rolón-Dow et al., 2021, p. 666). Shifting away from race-evasiveness toward racial literacy in teacher education requires a serious commitment from the various program stakeholders to actively identify and dismantle the long-standing practices and policies that prioritize whiteness.

Introduction

The term “diversity” has gained credence not only in educational settings in North America but beyond, as international institutions, corporations, and organizations increasingly reference the concept in their ethos and policies (Beech and Lista, 2012). Discourse around diversity, as with any other discourse, is subjected to recontextualization and transformation when it moves across borders and becomes varyingly interpreted by local actors (Bernstein, 2000; Lim, 2016a,b). This chapter aims to expand discourse around diversity beyond what is often referenced in Anglo-Saxon contexts, particularly in the US. By drawing upon literature beyond Anglo-Saxon contexts and sharing highlights from the authors’ previous case study of Singapore teachers’ perceptions of and attention to diversity, this chapter argues for diversity discourse to extend beyond Anglo-Saxon perspectives to engender more inclusive conversations and to understand its transformative possibilities and limits on the curriculum. To this end, diversity needs to be discussed vis-à-vis local contexts, by foregrounding how social, political, cultural, and geo-historical factors shape local definitions of diversity.

Diversity as a social construction

Diversity departs from difference. Whereas difference addresses the quality of variance, diversity is socially constructed with meanings and valuation assigned to group differences (Ghosh, 2018; Swartz, 2009; Lawson et al., 2013). Ethnicity, for instance, is a way of categorizing a group of people who identify with each other based on shared attributes or ways of living, hence the existence of *different* ethnic groups. However, it takes on another meaning when, upon being cataloged, evaluated and hierarchized, discriminatory behaviors or prejudicial attitudes are attached to *diverse* groups. How differences are conceptualized and socially constructed thus serves to divide people (Ghosh, 2018). To illustrate further, when African Americans are referred to as *diverse*, it reflects views of what is considered normal in the US context, namely White, Anglo-Saxon perspectives. Simultaneously, it speaks to the history of the US (briefly condensed) as founded and governed by White colonialists and missionaries, with slavery legalized to support the colonial elite’s interests, and the consequent marginalization of descendants of Africans who were forced to migrate.

Contemplating diversity as a social construction thus necessitates a scrutiny of the context within which diversity is invoked; history, politics, economics, culture, society and education shape and are shaped by the construction of social meanings, giving unique interpretations of diversity in various contexts.

(Heng and Lim, 2021, p. 2).

Diversity, therefore, is part of a “hegemonic discourse” (Swartz, 2009, p. 1045). It is not possible to speak of diversity alone. Diversity draws attention to what is different from the norm, through a deficit lens, with the norm yielding dominance over what is diverse (Lawson et al., 2013). Given how diversity discourse acquires unique meanings across different contexts, the next section sketches its development within Anglo-Saxon contexts. Particular attention is paid to the US as its demography, history,

politics, as well as English language, intersect to dominate the movement of discourse around diversity (Bank, 2012; Beech and Lista, 2012).

Diversity discourse in Anglo-Saxon contexts

School desegregation efforts, as with the US Civil Rights movement in the 1960s, drew attention to diversity within educational settings (Banks and Banks, 2019; Gollnick and Chinn, 2017). Consequently, educational initiatives—like multicultural education, ethnic studies, school desegregation research—flourished in attempts to include marginalized or absent groups of students into schools or the curriculum (Banks and Banks, 2010; Gollnick and Chinn, 2013). Driven by a vision of society that celebrates human rights, social justice, and freedom for all ethnic groups, these initiatives privileged cultural pluralism (Kallen, 1924).

Contemporary discourse on diversity in the US has since evolved from a narrow focus on ethnicity or culture, to encompass a wider variety of identity markers (Nieto, 2009). Through the years, as the scope of multicultural education broadened beyond ethnic studies and detecting textbook bias into other themes, like prejudice reduction, intercultural competence, and equity pedagogy (Bennett, 2001), so has the range of identity markers that have been associated with diversity. The widening range of identity markers reflects developments in the US society in face of the complex interplay of demographic, immigration, civil rights, political, and educational issues as well as the radical dissent and contestations characteristic of US history (Nieto, 2009). A cursory scan of textbooks in the US related to diversity sees diversity as frequently associated with race, culture, ethnicity, gender, class, language, sexual orientation, nationality, religion, physical and mental ability, exceptionality, immigration status (Vavrus, 2014; Banks and Banks, 2019; Gollnick and Chinn, 2017; Nieto and Bode, 2018; Sleeter and Grant, 2009).

Likewise, diversity discourse in Anglo-Saxon contexts such as Australia (Inglis, 2009; Ghosh, 2018), Canada (Joshee, 2009; Ghosh, 2018), and the UK (Tomlinson, 2009), make similar references to overlapping markers, like ethnicity, culture, and language. Gay's (2010) analysis of US textbooks used in teacher education courses on diversity found that textbooks tend to reference diversity predominantly around ethnicity. Similarly, studies on teachers' struggles with diversity in Australia (Hollinsworth, 2016; Mills, 2008), Canada (Parhar and Sensoy, 2011; Jacquet, 2008), the UK (Dunne and Gazeley, 2008), and the US (Castro, 2010; Ladson-Billings, 2006; Gay, 2010), appear to cluster around issues associated with White middle-income teachers' tensions in understanding their students' cultural, linguistic, and class challenges.

The predominant focus on issues of culture, language and class in research set within Anglo-Saxon contexts may seem natural to some. Given that diversity is a social construction that is typically construed in opposition to the dominant group, such a predominance echoes Ladson-Billings' (1999) observation that diversity "is that 'thing' that is other than White and middle class" (p. 219). Departure from Anglo-Saxon norms is seen "as deficit, as divisive, and as illegitimate" (Swartz, 2009, p. 1045), reflecting what is valued by the dominant group in society. Diversity, thus, needs to be "managed and domesticated" (Beech and Lista, 2012, p. 376); yet, as is evident in the subsequent section, diversity discourse beyond Anglo-Saxon contexts reflects different inflections departing from the discourse dominant in Anglo-Saxon contexts.

Diversity discourse beyond Anglo-Saxon contexts

In recent years, a growing body of work documenting diversity has emerged beyond Anglo-Saxon contexts (Beech and Lista, 2012). Hastened by educational policy borrowing and promoted by multi-lateral agencies and international education organizations, such as United Nations Educational, Scientific and Cultural Organization (UNESCO) and World Bank, diversity discourses have gained attention worldwide. While diversity discourses beyond Anglo-Saxon contexts similarly revolved—to some extent—around issues of ethnicity (Tsuneyoshi, 2018; Chang and McLaren, 2018; Jackson, 2018; Bhowmik et al., 2018), gender (Chang and McLaren, 2018), and class (Jackson, 2018; Chang and McLaren, 2018), nuances are evident given recontextualization through the local peculiarities of different countries.

In Japan, for instance, school children returning from abroad, are seen as diverse even though they share the same racial phenotype. These returnees prompted measures to "save" (Tsuneyoshi, 2018) them as they are seen as lacking language proficiency and the norms of acceptable behavior in both schools and the Japanese society. Likewise, mainland Chinese students who commute into Hong Kong for school—or, otherwise known as cross-border students—and new arrivals from mainland China are deemed diverse as linguistic minorities even though they are considered Han Chinese (Chang and McLaren, 2018). Yet, compared to cross-border students and families, ethnic minorities—like South Asians who, through voluntary and involuntary migration associated with British colonialism, have grown up in Hong Kong—are seen as even more diverse, lacking in Han Chinese culture and language (Bhowmik et al., 2018; Jackson, 2018).

In South and South-East Asia, diversity takes on other unique connotations. In India, diversity discourse tends to cluster around discussions of caste and religion, reflecting the dominance of the Brahmins and orthodox Hindus, as well as language and class, reflecting the British colonial legacy's valuation of the English language and class system (Ghosh, 2018). In Malaysia, religion and ethnicity are primarily used to identify who is diverse (Stephenson and Rajendram, 2019; Giacchino-Baker, 2000). Non-Muslims are deemed as "second-class citizens" (Giacchino-Baker, 2000) who are excluded from the economic privileges of being a *Bumiputra*, or son of the soil, as with non-Malay ethnic groups. This mechanism arose from a desire to respect pre-colonial indigenous populations and Malay immigrants from Indonesia and to recalibrate the economic imbalance, across the Malays, Chinese, and other ethnic groups, that the British had engineered (Stephenson and Rajendram, 2019).

Beyond Asia, Beech and Lista's (2012) work reveal how multi-lateral agencies' (such as UNESCO and World Bank) assumption of diversity, breaks down across contexts as it becomes conceptually ambiguous when positioned in different "cultural, ideological, socio-economic and political contexts" (p. 374). Citing Bolivia as an example, Beech and Lista showed how diversity departs from the European experience where immigrants of varying ethnicities are deemed diverse. Instead, indigenous communities marginalized through colonization are deemed "diverse" by Creole elites (descendants of European colonizers) despite the former's presence predating the latter's. UNESCO's "respect for diversity" was recontextualized as reclaiming the educational rights of Bolivia's indigenous population, even though they comprise more than 60% of the population. The notion of diversity, in the Bolivian example, reflects a complicated history of European colonization and dominance over indigenous communities, with dominance accorded to the groups wherein power resides, not necessarily the groups where numbers overrule.

These examples illustrate how "diversity acquires unique meanings in different contexts" (Heng and Lim, 2021) and, inadvertently, speak to the composition and concerns of dominant groups in these societies. The nuances in how diversity is interpreted departs from Anglo-Saxon perspectives and remind us of the need to foreground local peculiarities. Yet, conversations around and use of the term diversity, such as definitions and systems of classifications, have subliminally continued to center around Anglo-Saxon contexts (Beech and Lista, 2012; Yiu, 2019). Alternative ways of seeing diversity are marginalized (Yiu, 2019) or misrepresented (Yuan et al., 2020). Multi-lateral agencies and international education organizations' promotion of respect for diversity, for instance, reflects assumptions of Anglo-Saxon countries around ethnicity and culture and creates ambiguity and unintended consequences in destination countries (Beech and Lista, 2012).

Ironically, the diversity discourse set in Anglo-Saxon contexts risks becoming the dominant voice, with discourse departing from Anglo-Saxon contexts classified as alternative or diverse perspectives. A discourse that initially emerged out of a desire to include those that are marginalized and absent, with the potential to transform students' lives when enacted in the curriculum, now increasingly becomes mainstreamed with the power to silence others. While this discourse is beneficial in problematizing what is different and valued, in addition to setting examples for how dialogue and actions can ensue, it becomes limiting—when it is implicitly assumed to resonate in other contexts—and omits alternative voices. Given these partialities of the field, this chapter aims to expand and decenter the conversation around diversity beyond Anglo-Saxon contexts and to add to the nascent but growing body of knowledge on diversity worldwide. To this end, the chapter leverages a case study that examines how teachers in Singapore understood and addressed diversity in their classroom.

The Singapore context

Founded by the British in 1819, modern Singapore is home to immigrants from neighboring regions and afar. Singapore has historically been multicultural, attracting immigrants from China, South Asia, the Malay Peninsula, Riau Archipelago, and Europe (Lian, 2016). Contemporary Singapore has a population of 5.6 million with its resident population classified into four groups: Chinese (74%); Malay (13%); Indian (9%); and other ethnic groups (3%) (Department of Statistics, 2020). Multiculturalism, henceforth, is enshrined in its national policies, narrative, and ideology post-independence in 1965. Singapore's national pledge, for instance, declares that "regardless of race, language or religion," all citizens are united to "build a democratic society, based on justice and equality". Faced with a young nation comprising immigrants from different regions, the ruling party adopted multiculturalism in a bid to rapidly establish the country's national identity (Lian, 2016).

Over the years, the concept of multiculturalism has worked its way into governance policies, and official as well as private discourses (Lian, 2016; Ho, 2009). One example of multiculturalism's influence on policies includes the bilingual education policy where students learn their mother tongue during second language lessons and all lessons are taught in English to foster communication across ethnic groups. Another is the National Education program, a citizenship curriculum aimed at cultivating national identity and cohesion through Singapore's core values of multiracialism, meritocracy and multireligionism (Loh, 2014). These core values are promoted through the social studies curriculum as well as events associated with the National Education program, like Racial Harmony Day (where students learn about different cultures and dress up in ethnic costumes).

Despite the pervasiveness and emphasis on multiculturalism, scholars have critiqued the limitations of state-sanctioned policies and the concept of multiculturalism (Loh, 2022). For instance, Singaporeans and teachers are reluctant to join in conversations around topics like race and religion as they deemed the topics excessively sensitive (Alviar-Martin and Ho, 2011), and state-sanctioned diversity markers have seemingly erased differences that fall outside of those markers (Abu Bakar et al., 2021; Ho and Alviar-Martin, 2010; Lim and Tan, 2018). Teachers, as with students, tended to interpret diversity along state-sanctioned markers such as language, religion, and race, and are unaware of (or, hesitant to articulate) other conceptions of diversity.

Likewise, the concept of meritocracy has been subjected to criticism. Meritocracy works in tandem with multiculturalism: in a meritocratic system, all are equal to compete since a multicultural society promises a level playing field where no one culture is discriminated against (Koh, 2014; Lim and Apple, 2015; Lim and Tan, 2018). In the case of Singapore, merit has been associated with academic merit as its pioneering leaders argued that, being resource poor and small, investing in human capital was its most viable route to survival. Thus, education served the multi-pronged purposes of enhancing human capital, developing Singapore's economy, fostering national unity, leveling the society and promoting national identity (Gopinathan and Mardiana, 2013). Academic merit, arguably, seen as both objective and non-discriminatory, has consequently been woven into national and educational policies around tracking, promotion, access to scholarships, and prestigious civil service appointments, among others (Gopinathan and Mardiana, 2013; Lim, 2013). In enhancing social mobility through differential resource access, academic merit is thus

increasingly seen as a “positional good” (Kwek et al., 2019, p. 90). Yet, meritocracy appears to have created some unintentional consequences. Scholars pointed out that national standardized examinations have become so high stakes that they constrain teachers’ willingness to embrace more learner-centered pedagogy and assessment approaches (Heng et al., 2021; Heng and Song, 2020, 2021). Further, and especially pertinent to the present chapter, to the extent that the state’s discourse of meritocracy—particularly in its being putatively blind to individual’s social locations (class, ethnicity, gender, language, religion, etc.)—has evacuated a concerted focus on a politics of difference: teachers struggle with recognizing other kinds of diversity in addition to adopting more innovative and subtle forms of multicultural education (Alviar-Martin and Ho, 2011; Lim and Tan, 2018).

These details about Singapore set the stage for illuminating how diversity discourse outside the Anglo-Saxon context can differ markedly. The next sections sketch a study of ten Singaporean teachers’ perceptions of diversity and the curricular and pedagogical practices they undertake to address diversity. The research utilized data from a subset of a larger study of the same teachers’ perceptions and implementation of differentiated instruction (DI). As respect for student diversity is a core philosophy underpinning differentiated instruction, an educational approach championing instruction that is responsive to student needs (Tomlinson, 2014), a section of the study’s data—which was previously published (Heng and Lim, 2021) and is summarily treated here—lent itself readily to addressing the goals of this chapter.

Background of study

Ten participants from ten public schools were recruited via criterion sampling. Participants taught the nationally-examinable subjects of English, Mathematics, and Science, half taught in primary and half secondary schools, and all had teaching experience over two years. As part of the qualitative research data collection process, participants each completed a background questionnaire, three interviews (one each at the start and end of 2018) and four observation cycles.

The first interview elicited participants’ perspectives of student differences as well as their teaching and learning philosophies, the second, their insights on patterns observed over 39 lesson observation cycles. Each observation cycle comprises a lesson observation together with pre- and post-lesson observation interviews. During each cycle, two researchers kept qualitative notes, completed observation protocols separately, and met to derive consensus observation protocols based on their notes. Consensus observation protocols were subsequently analyzed, with the ratings and patterns reported to participants, prior to the second interview, as a form of member check and to collect data of their interpretations. Using Plano Clark and Ivankova’s (2015) method of “embedding” (p. 140)—i.e. including a secondary method of quantitative scales through the observation protocol in an otherwise qualitative approach—trustworthiness of the research was strengthened.

Inductive data analysis was performed, allowing for codes to emerge, as opposed to using pre-figured codes (Crabtree and Miller, 1999) that could carry inflections of Anglo-centric identity markers. For instance, when analyzing participants’ perspectives of student differences, recurring codes such as “mindset,” “motivation,” “disposition,” were grouped under “attitude” while “family background” or “single family” were sorted “family.” To further center participants’ voices and enhance trustworthiness, data were also compared across interviews, lesson observations, and analytic memos (Shenton, 2004). (For more details of the study’s research design and method, please refer to Heng and Lim, 2021).

Insights from Singapore teachers

Participants primarily saw student differences in terms of their academic strengths. This was evident in interviews—where they comprehended student differences predominantly as “ability,” “family,” and “disposition”—and in classroom observations, where curricular and pedagogical decisions revolved around students’ academic readiness. (Pseudonyms have been used below to protect participants’ identities.)

Diversity as academic readiness

In the first interview, participants were asked to state three important differences they saw across their students. The question deliberately used the word “difference,” as opposed to diversity, in case participants repeated oft-read Anglo-Saxon definitions of diversity. Participants’ top three responses banded around “ability,” “attitude,” and “family.” Participants defined ability as students’ “aptitude,” whether they “grasp things quickly” (Jon) and if they have “the ability in the mind to get or not get it” (Stella). Attitude was construed as students’ innate psychological strength or predisposition and discussed vis-à-vis educational outcomes. Participants talked about students differing in terms of their “motivation ... the attitude toward learning ... [with some] who are just very motivated to do something ... and [others] don’t budge” (Ping). They clarified that academic ability, while important, needs to be substantiated by “effort,” with effort articulated as “the will” versus a “mindset of giving up” and “determination ... [or] a drive that you want certain things” (Sharon). Relatedly, participants brought up family in terms of its structure—“single” versus “solid nuclear families”—and the “type of support parents give and values they instil” (Alfan). “Some kids come in advantaged ... [because] they have been propped up by mother or father or tuition,” (Matilda), others are “latchkey” as their “parents are busy working” (Zia). Participants primarily associated family with the level of academic support given to their children, explaining that family wealth, education or structure does not matter as much as whether “they [parents] will nag their kid” (Sharon) or support their children to study.

Despite the fact that the interview question was intentionally left open as “differences” participants saw, the congregation of participants’ responses around academic outcomes or studying was revealing. Ability was seen as “academic” ability (or how fast children

learn); attitude as the willingness to put in effort in learning; family as the level of support parents gave their child in studying. The gravitation toward differences around academic readiness and attribution of readiness to the individual or family—not wider institutions, cultures, or structures—is telling about the kinds of narratives and concerns dominating the larger society (and which will be discussed further below).

Curricular and pedagogical modifications around academic differences

Participants' modification of curriculum and pedagogy similarly reflected an emphasis on students' academic differences. Participants most commonly collected information on student readiness, and was scored 1.8 out of 4 (0 indicating no evidence observed in class and 4 indicating strong evidence). Readiness, according to Tomlinson (2014), is students' point of entry in relation to the knowledge or skill they are supposed to learn. A more ready student is seen as having mastered content or skill, while a less ready student needs more support and opportunities to master the learning objectives. While participants showed the strongest evidence collecting information on student readiness, they showed weaker evidence collecting information on student interest (0.6) and learning profile (0.8). Student interest is defined as what students exhibit affinity to or are curious about, while learning profile involves the ways in which students learn (Tomlinson, 2014).

Similarly, participants adjusted curriculum and pedagogy based on student readiness. When adaptive teaching was used, participants showed the strongest evidence in modifying instruction based on student readiness (0.8), followed by interest (0.6), and learning profile (0.4). Participants conducted assessment to determine academic readiness (e.g., administered Kahoot quiz or diagnostic worksheets to determine students' learning gaps), gave tiered assignments (i.e. assigned more challenging or extension tasks to academically-stronger students and more scaffolded tasks to weaker students), and focused more on academically-weaker students ("I help my rainbow group more because they're weaker" Zia).

Even then, adaptive teaching is infrequent as shown in the less than 1 scores across readiness, interest, and learning profile, pointing to a low appreciation of each child as an individual or recognition of different students' needs and how their needs could be addressed through the curriculum and instruction. Conversations in class tended to revolve around exam concerns, like "it's [the question] the easiest to score ... it's three marks ... a high value question" (Sharon) or teaching students procedural shortcuts that can help them score during exams. Some participants explained that choice was not offered to students as for "students who come from households that are not very structured ... it would be chaos ... it is very difficult for me to trust them," reflecting deficit perspectives around their students' academic capacities and family support for learning.

Revelations of dominant societal narratives and concerns

When participants were asked why readiness (or "academic ability") was privileged in how participants understood and responded to differences in class, they alluded to the national narrative of meritocracy, multiculturalism, equality, on top of a strong assessment and accountability culture.

Participants felt that highlighting and attending to student differences is contrary to the ethos of meritocracy where everyone begins from an equal footing and the most (academically) talented is sieved out. Participants pointed out that students and parents are also accustomed to the "fair as equal" mindset, thus prompting them to veer toward ensuring that students are "given the same things." Fairness occurs when "every child is given the same, regardless of their race or nationality" (Adel) so that meritocracy can perform its function.

The idea of meritocracy means that everyone has to be *given the same things* [emphasis added] whether or not they are able to perform. It's really up to them, it's their ability... I mean you and I are given the same things, so if you cannot perform then maybe it's because you're not working hard enough, or you're just lazy.

Alfan

To participants, examinations provide students an "equal playing field" as the outcomes (in this case, academic merit) can be "quantified" and evaluated against an "objective baseline." They acknowledged that standardized assessments are necessary to uphold a meritocratic and hierarchical society, where the "society is made up of many different levels Grading is an important thing to be able to sift out the different individuals to fit the different roles for society" (Adel). While some acknowledged that the playing field may not be as fair as it seemed, they rationalized that academic merit determined by standardized examinations was the best option until fairer alternatives present themselves.

Participants also exhibited discomfort in acknowledging and addressing differences, particularly along racial or cultural differences, revealing the effect of coupling meritocracy with multiculturalism. They worried about being seen as discriminatory and alluded to the sensitivities of discussing certain topics in Singapore. For instance, when asked why differences are rarely discussed in the classroom, Matilda explained that it is "very sensitive" to talk about differences "because we're very conscious of not offending and really don't know how other people will interpret what we say. In particular, she divulged that addressing cultural differences may result in her students thinking she is "racist." Participants' discomfort in discussing differences as it could be seen as "racist" and their perceptions of standardized exams as the most "equal playing field" reveal the constraining effect of meritocracy around discourses of differences, echoing other studies within the Singapore context (Abu Bakar et al., 2021; Ho and Alviar-Martin, 2010; Lim and Tan, 2018). Such assumptions and concerns obscure further investigations on the role of structural, cultural, and

institutional factors in students' lives and learning. This brings to question the plight of students with less economic, cultural, or linguistic capital, or whose ethnicity, nationality, or other identities may predispose them to less than optimal learning conditions.

Additionally, participants alluded to the tight coupling of the success-as-academic-merit mindset with Singapore's history, economic development, education approach, as well as assessment and accountability culture. They argued that since exams "sift[ed] out the different individuals to fit the different roles in society" (Adel) and "get [students] to a place that they want" (Sharon), there is an "intense pressure for academic excellence" (Stella), with teachers seeing their responsibility as helping students achieve the best results. This, they felt, was a legacy of Singapore's policies post-independence, as the national narrative revolved around the development of human resources as the only recourse for Singapore's development.

Our Singapore society has been defined and constructed [this way] ever since our independence ... we have only our manpower to rely on, because of limited resources, we need to achieve maximum efficiency for our students But eventually when the economy progressed ... the focus has changed ... but ... society hasn't quite moved on with the times, because we are still obsessed with the paper chase. Even the teachers also felt that, a measure of their own competency ... is defined as a success of students.

Alfan

Accountability, participants felt, is tied to the "performance of the class", and "results still matter, because everybody has their own professional reputation to uphold, nobody wants to be known as the teacher who cannot procure results" (Jon). While participants admitted that they were not averse to attending to students' needs beyond their academic readiness, they acknowledged that this has to be done post-exams, where "kids can be more creative" in the "freer, more relaxed environment ... where they don't have exams at the back of the mind" (Zia). They argued that student-centered approaches like differentiated instruction were "time consuming" (Adel/Jon/Matilda/Sharon/Stella) and impractical in light of the heavy syllabus. Meng Yong went as far as to admit that since success was defined through academic merit, "wider character development ... it's been sacrificed" in pursuit of academic excellence, while Sharon rued that the Ministry of Education's new policies for students to "find joy in learning rather than to just study for grades" is unrealistic as the "harsh reality" is that "post-secondary education really rely on the numbers [results]." According to participants, the tight coupling of the success-as-academic-merit mindset with Singapore's history, education, assessment and accountability culture constrain teachers' willingness to engage in educational approaches that value students' beyond their academic talents or that pays attention to other aspects of students' differences. Consequently, other aspects of students, for instance, their race, class, gender, or nationality, are bracketed away in the unparalleled focus on academic readiness (or merit).

Diversity as a social construction

This study of how teachers in Singapore perceive and respond to differences in the classroom illuminates the nuances around how diversity is seen in different sociocultural contexts. Teachers saw differences among students mainly through their academic readiness and related aspects, like student motivation and parental support. This predisposition toward academic readiness implicitly reveals the assumptions that dominate in society: that academic merit is to be expected and valued, and a lack thereof suggests variance from the norm. Diversity in this case, did not revolve around markers such as culture, language, and class—markers typically referenced in Anglo-Saxon scholarship. Diversity, in this case, also departed from those previously raised in Singapore scholarship, likely because this study involved teachers teaching a range of academic subjects, as opposed to only social studies teachers (Alviar-Martin and Ho, 2011), or teachers who were selected based on their understanding of culturally relevant pedagogy (Lim and Tan, 2020). Unlike previous studies where Singapore teachers expressed cognizance around state-sanctioned markers like race, language, and religion, teachers in this study were predominantly focused on seeing difference as academic readiness, to the extent of ignoring arguably less contentious aspects such as student interest.

Students, and parents, are seen unfavorably when they do not value or invest effort in academics, reflecting a deficit perspective and the wider hegemonic discourse (Lawson et al., 2013; Swartz, 2009). Participants' perspective of academic readiness as a combination of "ability," "attitude," and "family" allude to an unconscious predisposition to attribute differences to the individual or family, rather than the wider societal, institutional, or cultural influences. Alfan's observation that the meritocratic ideology places full responsibilities on the individual illuminates how academic weakness becomes privatized. The individualization and psychologization of differences in students' academic readiness and absence in interrogation of structural impacts on students' learning corroborate findings in extant literature around the privatization of academic underperformance (Jiang, 2016; Lim and Tan, 2018). The national narrative of meritocracy, in conjunction with non-discriminatory policies, appears to result in the perception of and attendance to student differences through varying levels of academic merit, echoing scholars' observations of the unintended consequences and constraints of meritocratic principles and policies (Alviar-Martin and Ho, 2011; Koh, 2014; Lim and Tan, 2018). This is further compounded by the strong assessment and accountability system, where high-stakes standardized exams determine students' futures and, consequently, evaluations on teachers' performances. To the extent that the above conditions perhaps suggest a weaker set of transformative possibilities for teaching practices that respond to diversity, it is important to point out that in less than liberal "strong" states that have historically assumed a larger presence in charting their society's moral and social orders, curriculums and their transformative potential have always been closely regulated by the state (Lim and Apple, 2016). Indeed, it may be that under conditions of meritocracy that constrain the elaboration of a discourse of social differences, the transformative potential of curriculums and pedagogies that seek to respond to diversity will remain rooted in dominant understandings of merit and ability.

Seen this way, in understanding diversity primarily in terms of academic readiness and subsequently differentiating their instruction to better cater to these differences so that students may be better prepared for the high-stakes examinations, the Singapore teachers presented were both working with and against meritocracy and its contradictory ideals around non-discrimination/egalitarianism and academic elitism (Lim, 2013).

The need to transform discourse and curriculum around diversity

This study illuminates how diversity is a social construction that is established within the wider and/or dominant context. Diversity, thus, needs to be understood as a relational concept and used with greater lexical precision. In using the phrase “diversity”, it cannot be assumed that readers or the audience recognize what it stands for as meanings of diversity are decoded and recoded across space and time. By continuing to talk about diversity in a taken-for-granted manner, diversity discourse ends up being normed against Anglo-Saxon discourse, even though markers typically associated with diversity—such as culture, class, language—are unique to Anglo-Saxon contexts. As the case of Singapore unveiled, presented teachers’ conceptions of diversity departed from culture, class, and language, clustering, instead, around the presence or absence of academic merit and its related effort. In sum, we argue that diversity needs to be articulated vis-à-vis its context. That is, when using the term “diversity,” it is essential to locate it within the discourse and practices in its context and foreground the history, culture, and modes of social organization to develop more accurate and encompassing understanding. For instance, in discussing diversity, it would be helpful to approach it as “diversity in Singapore/the US/context” or to include brief contextual insights, as opposed to merely referencing “diversity.” Analogically, these contextual references are akin to positionality statements in qualitative research, revealing authors’ awareness of the parameters of their lenses and their research’s transferability. The omission of contextual references and assumption that readers understand the term “diversity” per authors’ intent can potentially estrange and exclude readers from other contexts; it presumes that the authors’ context is the global context. Thus, the foregrounding of context makes diversity discourse more inclusive.

Consequently, diversity discourse, as well as curriculums around diversity, need to be deparochialized or provincialized to reflect its relational nature (Lingard, 2006; Takayama, 2016). Diversity-related curriculum, textbooks, and courses, for instance, would benefit from foregrounding how the concept is seen not just in the context or country of use, but beyond. Incorporating examples of how notions of diversity vary around the world, engenders greater sensitivity to different contexts and issues at play, reminding readers of ways of being and thinking they are unaccustomed to. The progression in genres of research related to multicultural education (Bennett, 2001) and incorporation of diversity-related courses in teacher education programs point to increasing recognition of the need to address diversity-related issues. Given the importance of these issues, more needs to be done to decenter the discourse so as to achieve epistemological inclusivity and greater inter-cultural understanding beyond Anglo-Saxon confines.

Glossary

Community-based Educational Spaces (CBES) Community-based educational spaces include after-school programs, community-based youth organizations, youth centers, etc. The term “education” is used to decenter “schools” and center the learning and development within communities or informal learning contexts

Out-of-School Time (OST) Out-of-school time refers to activities children and youth participate in during non-school hours. OST includes programming that takes place before, during, or after school and on weekends, and during the summer

Youth Work Youth work is widely recognized as a set of coordinated activities engaging youth in many formal and informal contexts supporting young people’s academic and social development

Youth Worker Youth workers are adults who guide, educate, mentor, and nurture youth through various stages of development. Youth workers may also be called mentors, youth advocates, adult allies, community-based educators, youth specialists, etc.

In the public imagination, education is often synonymous with formal schooling. Yet children and youth have always learned within informal settings like community-based educational spaces (CBES). Community-based education occurs in many contexts, including families, faith-based spaces, non-profit organizations, museums, libraries, detention centers, parks, and neighborhood centers (Fusco, 2012; McLaughlin, 2000; Rogoff et al., 2016; Heath and McLaughlin, 1994). Community-based educational spaces (Baldridge, 2018) consist of afterschool and out-of-school programs and a wide range of nationally-based and grassroots organizations that guide students through academic, social, and emotional development. Distinguishing community-based education from school-based education is vital to center the agency and knowledge of communities in young people’s education.

The presence of community-based education helps to dislodge the myth that learning and education only occur in traditional school contexts. “Youth work”—a set of activities to support the care, education, and development of youth typically in non-school settings, is central to community-based education. Although youth work happens in various settings, community-based educational spaces are common sites for youth work.

Historical context of community-based education

The decline of child labor and the rise of compulsory schooling in the United States during the 19th Century created the need for afterschool child care. Newly arrived immigrants and children living in poverty were the primary participants of afterschool care in settlement housing, faith-based institutions, and early Boys Clubs (Halpern, 2002). Programming included English language development, play, citizenship education, and workforce skill development (Halpern, 2002). Non-European youth were primarily excluded from these early afterschool spaces.

During Black Migration, Black families settled in northern cities, placing them in contact with European immigrant communities. However, Black youth were excluded from afterschool clubs where European immigrant youth were present. Black communities were forced into specific neighborhoods in cities and were excluded from established clubs. Youth work took place within churches and other community programs established by the Black community (Baldridge, 2019; McKenzie, 2004). Other racially minoritized and marginalized communities facing oppression established spaces of affirmation and refuge for young people in their communities. Ultimately, what is recognized today as community-based education or youth work has always occurred within racially minoritized communities. The labels and terms we use today to describe education in communities outside of traditional schools may be new, but the work itself has always been embedded within historically marginalized communities.

Economic disinvestment in urban communities and lack of social safety nets characterized the late 1970s and 1980s. During this time, raced and classed-based policies criminalized Black and Latinx youth as problems to be controlled and contained (Ginwright, 2010). As such, community-based programs for youth emerged significantly during this time and engaged Black and Latinx youth in cities (Baldridge, 2019; Ginwright and Cammarota, 2002)—and in some cities, Southeast Asian and Pacific Islander youth (Kwon, 2013). The framing of community-based programs targeting these youth populations was often rooted in racist paternalism. Due to economic disinvestment and inadequate schooling, these programs were vital to youths' academic development, social support, safety, and well-being (Baldridge, 2019; Ginwright, 2010).

In 1994, The Clinton Administration signed into legislation the 21st Century Community Learning Centers (21CCLC) grants. This legislation provides opportunities for federal funding for afterschool programs to support college and career readiness. Schools and organizations that meet the criteria can apply for 21CCLC funding. Organizations apply for these funds while also relying on donors, local city support, and philanthropic foundations.

Features of community-based education: key findings

Research in the United States and the United Kingdom demonstrate that youth work and education in community-based spaces support youths' academic growth, facilitates greater attachment to school, builds youths' self-efficacy, and raises their critical consciousness, among other things (de St Croix, 2018; Ginwright and Cammarota, 2002; Hirsch et al., 2011; Vadeboncoeur, 2006). Besides supporting young people's academic identities, community-based education connects youth with caring adults to foster social, political, and cultural development. To be sure, the comprehensive approach to youth development within community-based educational spaces can be distinct from the formal and often punitive nature of traditional school spaces. Research studies with youth participants in community-based educational spaces reveal that many prefer attending after-school programs at community centers over schools because they feel treated with dignity and respect by adult youth workers (Baldridge et al., 2017; Douglas and Peck, 2013). Cultivating relationships between youth and adults grounded in respect and dignity for young people's humanity is an essential feature of community-based education.

Pedagogical and philosophical diversity

Community-based educational spaces are philosophically and pedagogically diverse (Baldridge, 2018). The structure of community-based education depends on its leadership, staff/youth workers, funding status and sources. Even though there are distinct differences in how community-based educational spaces carry out their work with youth, what is expected is the centering of youth and comprehensive youth development approaches (Brion-Meisels et al., 2020). It is also important to understand that leaders and youth workers in these settings approach their work seriously and are grounded in pedagogical practices that are rigorous and systematic.

Relationships, social capital, and advocacy

A key feature of youth work occurring within community-based education is the relationship building between youth and adult youth workers. The relationships that form in these spaces are often rooted in mutual respect and radical care and the humanity of young people and their multiple needs (Brion-Meisels et al., 2020; Ginwright, 2010; Paris and Winn, 2013). Research studies show that community-based education fosters social capital building in many forms, including institutional advocacy (Stanton-Salazar, 2011). Further, social capital building in community-based education affirms cultural wealth (Yosso, 2005) and supports cultural capital acquisition. For example, in programs that support youth through college and career access, youth workers broker connections with industries youth seek to be a part of; and provide material resources to support college and career readiness and lead youth to others who can support their transitions (Nelson, 2016). Some scholars have also extended how social capital manifests in urban community-based educational spaces. In a study with Black high school-aged youth in Oakland, California, Ginwright (2007) found that youth cultivated what he terms *critical social capital*—an intergenerational relationship between youth and adults in which youth identify and organize against sociopolitical problems in their schools and communities.

Activism and organizing

The acquisition of critical consciousness and sociopolitical development are precursors to engaging in activism and organizing (Kirshner and Ginwright, 2012; Watts and Hipólito-Delgado, 2015) and are vital features of some community-based educational spaces especially engaging Black, Indigenous, Latinx, and Asian and Pacific Islander youth. Community-based programs focused on racial identity development, gender justice, queer justice, racial and ethnic coalition building have been exemplars of engaging youth in organizing and activism (Kirshner, 2015). Research demonstrates that schools rarely engage youth in critical conversations about the world; whereas, community-based educational spaces are celebrated as flexible and unencumbered by the constraints of schools, to engage youth in "reading the world" (Freire, 1970/2018), to process and identify sociopolitical problems, and to act upon them (Kwon, 2013; Nygreen et al., 2006).

Considering sociopolitical context

Community-based educational spaces are celebrated for being settings where youth can thrive. They are often positioned in stark contrast to school settings where racialized and gender and sexually expansive youth experience harm. Yet, community-based educational spaces are not exempt from the same structural forces that shape the context of schooling (Baldridge, 2020a). The sociopolitical context of community-based education includes macro-level structural forces like racism, anti-blackness, capitalism, settler colonialism, heteronormativity, to name a few. These forces inform the construction of these spaces, philosophical approaches to youth development, funding patterns, pedagogical practices, as well as leaders, youth workers, and youth participants' experiences (Baldridge, 2020a; Fusco et al., 2013; Kwon, 2013; Lardier et al., 2018).

This sociopolitical landscape also includes how discourse and trends in educational policy shape how community-based education is delivered. For example, market-based approaches to an educational policy like No Child Left Behind (2002) and its emphasis on standardization and accountability—or Race to the Top (2009)—centered on competition—has led to success being measured by test scores, grades, and an organization's ability to “reduce achievement gaps” (Baldridge, 2014; Nygreen, 2017). More recent research has revealed how educational policy and educational philanthropy have shifted how community-based educational spaces are funded (Baldridge, 2019). For instance, some have argued that with the onset of privately-run charter management organizations in an era of neoliberal education reform, funders who have traditionally funded youth development organizations are now widely donating to charter schools instead of community-based educational spaces (Baldridge, 2014).

The reality of racism, white supremacy, heteronormativity, and capitalism, among other forces of domination, informs these spaces' legibility for racially minoritized youth. In other words, these forces can shape how community-based education is situated within the landscape of education. A reality of this context's impact is that community-based educational spaces can be positioned to “fix” or “save” youth from their circumstances. This framing is dangerous as it obscures the role of structural inequality and oppression that shapes young people's lives—especially young people experiencing multiple layers of racial, gender, class, and sexual oppression.

Challenges in the field

A strength of community-based education is its diversity; however, its heterogeneity also makes the field complex and challenging. The landscape of community-based education and youth work is vast, making it challenging to define. The sector is not one thing but a collection of many approaches, settings, and institutional arrangements that make up the field (Baldridge et al. 2022). The sector includes programming in city government agencies, cultural institutions, grassroots organizations, nation-wide programs, colleges and universities, and many other spaces that engage youth. Although these spaces serve youth, their ties, funding sources, and approach to youth development and education vary.

Because learning and education are analogous to schooling in the public imagination, community-based education and youth work are often overshadowed by learning in traditional school settings (Baldridge, 2020a). As such, community-based programs are undervalued as learning sites, and the educators within them are often delegitimized as educators (Vasudevan, 2019). The lack of a solid infrastructure does not exist; and, youth work does not typically require credentials and advanced schooling to enter the profession. Further, youth work does not fit neatly into one discipline and lacks a professional association as other disciplines have (Fusco, 2012; Yohalem, 2003). Although this may be a challenge for the field, some scholars recognize that requiring specific credentials may cause stratification and inequality. Many youth workers do not hold advanced degrees or even college diplomas but are highly competent and dedicated community-based educators (Baldridge, 2020b; Heathfield and Fusco, 2016; Watson, 2012). At the same time, research has shown that youth workers desire more support, professional learning communities, and opportunities to improve their practice (Yohalem and Pittman, 2006; Vasudevan, 2019).

Community-based education is marked by high turnover, and it is well-known that youth workers receive low wages and work long hours. In some studies, community-based youth workers from racially minoritized backgrounds report having few opportunities to be promoted to leadership positions (Baldridge, 2020b; Fusco, 2012; Pittman et al., 2004; Vasudevan, 2019). Generally, the field is characterized by instability and lacks strong infrastructure. In many cases, the flexibility offers greater choice and breadth for youth. However, the flexibility and instability have real material consequences for leaders and youth workers in community-based educational spaces.

Possibility and future(s): research, policy, and practice

Despite the challenges facing community-based education, there are immense possibilities within the field across research, policy, and practice. Decades of research reveal that young people—especially the most marginalized—find refuge, healing, radical care, and sometimes, tangible material benefits from their participation. Research continues to demonstrate the extraordinary impact of community-based education on young people's academic, social, political, and activist identities. Although the field's heterogeneity creates conundrums and tension for practitioners and researchers, it also provides ample opportunity to meet youths' specific needs.

Given the unstable infrastructure of community-based education, programs are often in financial jeopardy as funding patterns are uneven. Future policy directions can be instrumental in legislating more funding for community-based educational spaces or simply avoiding financial cuts to 21st Century Community Learning Grants and supplementary education at the federal level. Research continues to push the field in important directions concerning understanding youth workers and youth participants' experiences. More recent research is advancing the field in critical ways that raise questions about the broader sociopolitical landscape of the field—including forces of domination, educational policy, and philanthropy, and how it shapes the construction of community-based educational programs, youth and youth worker experiences. Research in this domain is necessary to uncover and disrupt processes that perpetuate harm to ensure that community-based education supports comprehensive, humanizing, and dignity-based programs for youth.

Community-based education is constantly in flux, but its future is bright. With additional research, political and public buy-in, supportive policy initiatives, and a solid infrastructure that values and protects youth workers and community-based leaders, community-based education can be valued as a legitimate space of learning and development for youth.

While media education has a long history and takes shape under many names, schools of thoughts, and approaches, the fundamentals remain constant, aptly captured by the basic definition of media literacy which originated in the early 1990s, now updated, by the US based National Association for Media Literacy Education (NAMLE): “a framework to access, analyze, evaluate, create and participate with messages in a variety of forms—from print to video to the Internet. Media literacy builds an understanding of the role of media in society as well as essential skills of inquiry and self-expression necessary for citizens of a democracy” (medialit.org, accessed March 1, 2022). This entry is organized into Context and Significance, History of Media Education, Media Literacy Frameworks, and Gaps and Future Directions.

Context and significance

Each year, the media landscape poses daunting new challenges to 21st century education. In our era of ubiquitous media, people around the world spend more time online every year; almost 60% of the world’s population are now using the internet ([Johnson, 2021](#)). As of January 2020, 49% of the world’s population is using social media platforms with the average usage time rising to almost two and a half hours per day, which is expected to increase ([Statista, 2022](#)). Social media users are growing at a faster rate than pre-pandemic with the global total increasing at a rate of 13 new users every second ([DataReportal, 2022](#)).

Before the advent of the internet, exposure to media messages was limited to certain times and places. News was restricted to the daily newspaper or the evening television program, and to films available only in movie theaters. Media was unidirectional, with messages transmitted solely from producers to audiences who consumed content, but had little opportunity to respond or produce themselves.

The advancement of information and communication technologies makes it easier not only to access but to produce and circulate various forms of media to users around the world, radically changing not only the entire media ecosystem, but society as a whole ([Sagan and Leighton, 2010](#)). The early stages known as “Web 1.0” allowed internet users to create their own webpages and post their own content online, but these were usually static rather than interactive ([O’Reilly, 2007](#)). While often noted as an “industry-driven phenomenon,” the interactive and user-centered nature of Web 2.0 and emergence of social networking platforms now drive the participatory web ([Ellison and Boyd, 2013](#)). The digital revolution has altered the very nature of communication with users being one click away from connecting with anyone around the world.

The digital media landscape and its challenges for media education

Some describe the contemporary landscape as an “infodemic”—an overabundance of information that compromises logical thinking ([Durodolu et al., 2021](#); [World Health Organization, 2020](#)). Public opinion is increasingly influenced more by “emotions

and personal belief” than “objective facts,” resulting in what some call a “**post-truth**” era (Oxford Dictionaries, n.d.), a term named word of the year in 2017, its usage having risen 3000% in a single year (Boler and Davis, 2021; McIntyre, 2018). Media educators, librarians, and information professionals are left asking: how can we discern a shared reality amidst not only a deluge of “accurate” information sources but in this time of heightened deception by “pervasive and deliberate spread of misinformation geared towards deceitfulness”? (Durodolu et al., 2021, p. 175).

The proliferation of mis- and dis-information has become a key focus of educators and librarians. **Misinformation** refers to information that is unintentionally inaccurate or misleading, while **disinformation** is a type of intentionally deceptive information (Hwang et al., 2021) usually designed to achieve specific political ends (Benkler et al., 2018). Disinformation is often discussed as “**fake news**”, a buzz word that many scholars now deem as “vague and value-laden” (Marwick, 2018, p. 476), “used differently by different discourse communities” (Comber et al., 2018, p. 97). Defined as “false, often sensational, information disseminated under the guise of news reporting,” in 2017 the term “fake news” was named “Word of the Year” by Collins Dictionary—a year in which its usage rose by 365% (Flood, 2017). While false and sensationalized news are not modern phenomena by any means, as histories of news media and propaganda evidence, they are produced and circulated with the touch of a button (Boler and Davis, 2021; Osborne, 2018; Schudson, 1995).

The confusion surrounding “fake news” has led some to advocate the term “**problematic information**” to describe the range of false and misleading information that exists on a continuum with mainstream partisan media (Marwick and Lewis, 2017; Jack, 2017). While some forms of falsified news stories are particularly dangerous, all types play a key role in information warfare. A 2018 review of 34 articles suggested a typology of **six types of “fake news”**: news satire, news parody, fabrication, manipulation, advertising, and propaganda (Tandoc et al., 2018). Propaganda increasingly takes “new digital forms” that are pervasive and accelerate distribution, and continue to “blur the lines between entertainment, information, and persuasion” (Hobbs, 2017, p. 28).

Importantly, these new forms of propaganda are primarily utilized by the **far right**. Far-right extremist groups have developed “techniques of ‘attention hacking’ to increase the visibility of their ideas” (Marwick and Lewis, 2017, p. 2), creating conspiracy, community and spectacles using techniques that range from exploiting outrage to using memes, bots, social media and algorithmic recommendation systems to increase the visibility of their ideas (Farkas et al., 2018; Conway et al., 2019).

The evolving digital media landscape is shaped by numerous elements that have redefined our relationship to information and media.

Bots are automated software agents, programmed to collect data and conduct searches and speed up processes of information collection from the internet. Bots can radically influence public opinion, when used “to inflate the numbers of followers a politician has; to spread propaganda; to subtly influence political discourse; and to aggregate and broadcast content” (Marwick and Lewis, 2017, p. 38; Geiger, 2018).

Algorithms refer to the code that instructs the computer to perform specific tasks, playing a key role in determining what information is considered most relevant to us (McKelvey, 2014; see also Gillespie and Seaver, 2016; Brogan, 2016). Algorithms are increasingly recognized as embedded with “the agenda, biases, and vulnerabilities of the programmer” (Cohen, 2018, p. 145) raising concerns about **algorithmic governance** (Ziewitz, 2016). Algorithmic bias results, for example, in reinforcing stereotypes and social biases of race, gender, sexuality and ethnicity, privileging whiteness and emphasizing racist and gender stereotypes in searches (Noble, 2018).

Clickbait refers to the deliberate use of misleading headlines and thumbnails of content on the Web, whose main purpose is to attract attention and encourage clicks using sensationalist and emotional approaches to presenting information, thus easily spreading conspiracy theories and disinformation (Zannettou et al., 2019).

Echo chambers, or **filter bubbles**, describe the phenomenon of being enclosed within online communities of like-minded individuals, and thus not encountering alternative views and sources; as well, they reflect the degree to which algorithms shape and narrow what we see and who we interact with only (Rushkoff, 2010). Debates continue regarding the degree to which echo chambers may increase social and political polarization and extremism (Pariser, 2011; Flaxman et al., 2016).

While **propaganda** and news media have always sought to hook our emotions as a means of grabbing attention, the targeting of emotion and affect is prevalent within the ongoing media battles to shape, influence, and control public and political opinions. Viral media relies on the targeting of strong emotions such as rage, hate, and excitement (Crockett, 2017). **Polarization** refers in part to the gap in ideological perspective and values held by opposing parties (PEW Research, 2021), and stark disagreements regarding issues (like the Covid-19 pandemic) and differing levels of trust in media (Dimock and Wike, 2020). Polarized politics are increasingly linked to social media expressions of emotion and identity, especially surrounding race, immigration, and gender (Benjamin, 2019).

Confirmation bias refers to the tendency to search for and interpret information in a way that supports our prior beliefs, expectations, or hypotheses (Halpern, 2013). Confirmation bias is driven by **motivated reasoning** in which emotional biases lead to making decisions based on desirability rather than accuracy (Westen et al., 2006).

Distrust of the foundational institutions of democracy—government, media, and experts—by citizens from both of the political aisle has led to divisive online discourses and hyper-partisanship (Rainie et al., 2019). Public confidence in scientists and medical professionals continues to decline sharply: “confidence in medical scientists to act in the best interests of the public” dropped from 40% of American adults in 2020 to 29% in 2021 (Kennedy et al., 2022; Oreskes, 2021). Public confidence in the military, K-12 school principals, and police officers to act in the public’s best interest has also declined (Kennedy et al., 2022).

Skepticism directed at scientific authority is apparent in mis- and disinformation campaigns in the context of climate change and the COVID-19 pandemic. For example, climate change misinformation campaigns falsely frame the issue as a debate by

suggesting there is still doubt about the scientific findings (Damico et al., 2018); “elite-driven counter-movement” linked to conservative think tanks cultivates public skepticism regarding environmental protection (Jacques et al., 2008; Oreskes, 2021).

In sum, the digital media revolution has proven to be a double-edged sword: it gives everyone a voice, makes “everyone a journalist,” and provides means to catalyze protest movements like Black Lives Matter and #metoo (Boler, 2008; Leong et al., 2019; Ratto and Boler, 2014). But it also enables increased police surveillance of activists and BIPOC (Walsh and O’Connor, 2019; Benjamin, 2019), false information published with the touch of a finger, and the rise of surveillance capitalism, a “new logic of accumulation ... [that] aims to predict and modify human behavior as a means to produce revenue and market control” (Zuboff, 2015, p. 75).

For librarians and educators tasked with providing guidance in evaluating authority and credibility, this increasing distrust poses significant challenges (Nichols, 2017; Saunders and Budd, 2020). What counts as authoritative and credible information if there is no agreement about expertise? How can media education find the right balance given the need to critically assess the authority of information, while also maintaining a respect for expertise? How much responsibility lies with educators, versus with governments, social media platforms, advertisers?

History of media education

The rise of mass media in the 1920s represents a key moment for the roots of media literacy as radio, film and journalism became increasingly accessible. Across myriad countries, film-related education and outreach began through formal and informal educational contexts: from the Cinema Club movement in Paris (1922), to the British Film Institute (1933) which provided extensive educational outreach, and in Russia as well, though Stalinism quickly put this on hold.

Worries about propaganda emerged in the build up to the Second World War alongside the rise of journalism, radio, and broadcast television news. Edward Bernays, known as the “father of public relations,” contributed what essentially became the handbook for principles of propaganda (Bernays, 1928).

Educational efforts to counter propaganda took root in the 1930s, with the 1937 establishment of the Institute for Propaganda Analysis (IPA), an organization of journalists and educators which can be seen as an early arm of media literacy. Influenced by the study of Nazi propaganda, educators tended to see audience members as passive victims of mass media. The overlap of contemporary approaches to media education and the “ABC’s of Propaganda Analysis” developed in 1939 and the 2007 Core Principles of Media Literacy Education developed by the “National Association of Media Education and Literacy” is noted by Hobbs and McGee (2014).

A significant strand of what would come to be called the “protectionist” and “inoculation” theory of media education surfaced early on, with the 1938 UK Spens Report depicting media and popular culture as a contagious threat to civilized values. The inoculation approach was also reflected in what is termed the Leavisite tradition of Britain, which would be radically challenged by British cultural studies in the 1980s. F.R. Leavis’s 1942 curriculum sought to “inoculate” students from the cheap commercialized content of “lowbrow” popular culture that was “infecting” Britain’s “high cultural” values of civilized literature (Masterman, 1980).

The debates and discourses of “protectionism” and “inoculation” of youth against media’s ill effects overlaps with other significant media studies debates, such as those surrounding technological determinism and the “media effects” model. In Canada, Marshall McLuhan’s radical theories (e.g., McLuhan, 1964) developed the thesis of the media effects model. It is not just the content of media, he argued, but their form itself that communicates the message: the medium is the message. In part thanks to McLuhan’s influence, Canada was an early leader in media education.

The uses and gratifications approaches to understanding human relationship to media that took hold in the 1960s and ’70s in America contrasted with models of passive viewership, introducing a functionalist view and “cognitive revolution” in media theory. While the media effects model privileged the perspective of the communicator and medium, uses and gratifications focused on audience perspective, and the “social and psychological needs” “satisfied by exposure to mass media” (Ruggiero, 2000, p. 6).

The 1970s and ’80s saw the influence of Paolo Freire’s critical pedagogy which provided the seeds for critical media literacy (CML), and his philosophy and literacy praxis which involved critical consciousness and learners “reading the world” (not just the word). In 1980 Len Masterman’s highly influential text *Teaching the Media* was published, a new touchstone for media education around the world.

In 1982, UNESCO hosted a symposium with educators, communicators and researchers from nineteen countries, who came together for a five-day international symposium, the result of which was the unanimously issued Grunwald Declaration on Media Education, which urged educators, parents, communicators to accept the central and pervasive role media had come to play in our lives. Lamenting the absence of formal and informal efforts in media education, the Report advised: “Political and educational systems need to recognize their obligations to promote in their citizens a critical understanding of the phenomena of communication Responsible educators will not ignore these developments, but will work alongside their students in understanding them and making sense of such consequences” (Grunwald Declaration, 1983).

Debates that emerged in the 1980s continue to this day: Can media education protect students from the pernicious effects of media depictions of violence, pornography, body image, and harmful stereotypes around race, class, gender, sexual orientation, etc.? Do violent video games promote and cause violent behaviors? Is Instagram causing tweens and teens to strive toward impossible body images and social status, promoting eating disorders and self-harming behaviors?

Other debates emerged in the 1990s, for example in the context of the first media education conference in the United States in Rowe (1995). Conference events and sessions revealed a significant divide in educators and scholars' perceptions regarding the aims of media literacy, coalescing around such questions as: How "evil" is mass media and popular culture, and should educational efforts accept financial support from media industries (see Huesmann et al., 1983)? Should media literacy primarily be the province of schools (Aufderheide, 1993; Alvermann and Hagood, 2000; Hobbs, 2008)? Should media production be an essential feature of media literacy education (Lewis and Jhalley, 1998; Hobbs et al., 2013)? To what extent should media literacy have an explicit political and ideological agenda? (Hobbs, 1999).

Debates at the 1995 conference regarding the extent to which media literacy should have explicitly political and ideological agendas resulted in the conference splitting into two distinct organizations—one with a more activist and political view, the Action Coalition for Media Education (ACME) and the other, now known as the National Association for Media Literacy Education, NAMLE which saw media education as more politically neutral.

Sparked by the Universal Declaration of Human Rights, in 2011, the European Commission called for "strategic media education in compulsory schooling" (McDougall et al., 2015, p. 5), seeking to put into practice the human right "to seek, receive and impart information and ideas through any media and regardless of frontiers" in order to "empower citizenries all around the world to have the full benefits of this fundamental right" (UNESCO, 2011, p. 4). The UK has consistently ensured a focus on media literacy; for example, in the 1950s establishing two renowned sources of media education early on British Society for Education in Film and Television and commencing the publication of *Screen*, academic journal of film and television studies (see <https://www.frankwbaker.com/mlc/media-literacy-history/>). Hungary, Slovakia and Czech Republic were early leaders integrating media literacy into secondary school curricula (Federov, 2014). Australia has long advanced media literacy curricula, dating back to the 1940s (Corser et al., 2021). In Canada, the Association of Media Literacy was founded in 1978 by Barry Duncan; the province of Ontario was the first province to mandate high school media literacy curricula in 1987, and it added this for K-8 in 2006 (Jolls and Wilson, 2014; 2021). Research found that the United States is the "leading exporter of media" yet having the fewest media education programs within schools (Kubey, 1998). The 2020 U S Media Literacy Policy Report reveals that in the US, "only 14 states have taken substantial legislative action for media literacy education" (Hobbs and Jensen, 2009; Media Literacy Now, 2021).

Media literacy education frameworks

Conceptualizations of literacy have undergone several transformations in the second half of the 20th century and into the 21st century that have largely been mimicked by media literacy and its sub-types (Ashley, 2019; Cappello, 2017; Pangrazio, 2016; Zarouali et al., 2019). Literacy was traditionally understood as being the ability to read, write, and understand text or arithmetic (Cappello, 2017; Malmelin, 2010), an "umbrella concept that comprises different forms of reading and interpretation" and involves an "individual's personal ability to understand different kinds of signs and symbolic systems, and ... produce different kinds of messages by using these symbolic systems" (Malmelin, 2010: 132). In the late 1970s, scholars from New Literacy Studies argued that literacy is not a neutral practice that is linked only to psychological abilities, but rather a situated practice that is closely tied to political, institutional, and cultural relationships and practices (Cappello, 2017). Later, technological advancements raised questions about whether it was enough for literacy to be concerned with written text or if it should also include the "reading" and production of images, videos, music, and other forms of communication (Hobbs, 1997; Alvermann and Hagood, 2000; Gee, 2003). In 1996, The New London Group advocated the "multiliteracies" approach to account for the way learners navigate multiple literacy methods including visual, spatial, and multimodal (New London Group, 1996; Luke, 2005). At this same time, the growing media literacy movement defined literacy as "the ability to access, analyze, evaluate, and communicate messages in many forms," which also reflects recognition of multiliteracies (Hobbs, 1997, p. 169). It is from this definition that media literacy became defined as the ability to access, evaluate, analyze, and produce media of a diverse kind (Aufderheide, 1992).

The following descriptions of variations of media literacy each emphasize different aspects of media or different approaches, philosophies, or pedagogical aims.

Critical media literacies

CML, also known as critical media education, works from the basic definition of media literacy: the ability to access, analyze, evaluate, and communicate information (NAMLE, 2007). However, CML moves beyond the arguably more "instrumental" forms of media literacy to incorporate analysis of the political, economic, cultural, and historical contexts of media messages: media messages are neither neutral nor do they exist in a vacuum. All media serve as agents of socialization that promote values, cultures, and interpretations reflecting the interests of their producers and funders (Domine, 2011; Ashley, 2019). The question of who controls the media, who benefits from the meanings and values embedded in representations, are driving questions of critical media education.

CML is tasked with providing skills to deconstruct the symbols, signs, codes and conventions that produce meanings that become "naturalized" as taken-for-granted dominant cultural "truths" reinforced by mass media and stereotyped representations. CML education involves "cultivating skills in analyzing media codes and conventions, abilities to criticize stereotypes, dominant values, and ideologies, and competencies to interpret the multiple meanings and messages generated by media texts" (Kellner and Share, 2005, p. 372). Teaching students to be critical of media representations and discourses that (re)produce oppressive

norms prepares learners to navigate media while understanding broader contextual issues of power, ideology, and intent (Funk et al., 2016; see also Luke, 1997; Buckingham, 1996).

CML has roots in numerous traditions: the Frankfurt School (Adorno and Horkheimer, 1944); critical literacy and pedagogy traditions (Freire and Macedo, 1987; Luke, 1997); and the Birmingham School of Cultural Studies and the work of Stuart Hall (1980). Critical and radical pedagogy are grounded in Gramsci's conception of "hegemony," which describes how the dominant class maintains control by "naturalizing" ideologies. Freire's emphasis on critical consciousness or "Conscientization" understands literacy as far more than a set of skills but rather a way of "reading the world," of understanding how hegemony works—how socio-economic and political powers construct our very perception of the world (Garcia et al., 2013; Freire and Macedo, 1987; Freire, 1970). Neo-Marxist scholars (such as Henry Giroux, Peter McLaren, Stanley Aronowitz, Colin Lankshear) theorized the field of critical pedagogy. The work of Stuart Hall and the Birmingham School of Cultural Studies significantly shapes CML, understanding of meaning making "as a cultural struggle between dominant readings, oppositional readings, or negotiated readings" (Kellner and Share, 2007b, p. 8; see also Hall). CML also adopted the cultural studies understanding of viewers not simply as passive spectators or "victims" of media but as "active constructors of reality" (Kellner and Share, 2007a, p. 63).

Significantly, CML counters the longstanding "protectionist" anxieties of media studies, instead embracing both the pleasures of and the need to deconstruct popular cultural texts. Although popular culture and mass media may contribute to social problems, such media need to be more fully contextualized (Kellner and Share, 2005, p. 60; see also Buckingham, 2002; Jenkins, 2009). Early on, CML embraced media arts production as a means for young people and marginalized communities to create their own representations, and engage media in struggles against oppressions (Alvermann and Hagood, 2000; Morrell et al., 2015). By 2015, scholars and educators recognized young people's engagement as producers, "spending the majority of their time as consumers and producers of media," which of course has both "positive and potentially harmful effects" (Morrell et al., 2015).

While critical media education focuses centrally on deconstructing stereotypes, not surprisingly scholars and teachers point to the need for strategies specifically tuned to the needs ranging from a focus on equity, anti-colonialism, critical race, and native and indigenous media literacy. A 2020 issue of the *International Journal of Multicultural Education* contributes 11 articles providing diverse approaches to "critical race media literacy," which constitutes "a frame through which teachers and students can confront racist, colonial, classist, ableist, and heteronormative representations in media; interrogate the messages represented in problematic media messages; and navigate the complexities of representation in the classroom and society" (Hawkman and Shear, 2020, p. 2; see also Yosso, 2002; Scharrer and Ramasubramanian, 2015). Work on media education and decolonization is more recent (Romero Walker, 2021). A 2020 special issue of *The International Journal of Critical Media Literacy* provides cutting-edge work on CML and hip hop education (Graves et al., 2020).

Advertising literacy

Advertising first came under intense social scrutiny and concern in the late 1950s when market researcher James Vicary fraudulently claimed to have successfully increased the sales of products like Coca-cola and popcorn through the use of subliminal cues (Mal-melin, 2010). Contemporary advertising literacy (AL) focuses centrally on consumer's ability to recognize and critically evaluate advertisements (Rozendaal et al., 2011; Hudders et al., 2017) and its goal is to empower individuals with the knowledge, skills, and attitudes to protect themselves against harmful effects of advertising and be critical consumers (Jeong et al., 2018). The core AL skills include understanding persuasive intent and tactics, recognizing advertisements when they are present, and activating the right knowledge and attitude structures to critically evaluate advertising (Rozendaal et al., 2011).

The limitations associated with peoples' ability to recognize, and subsequently resist, advertising is a growing concern in the 21st century. The shift from print and TV advertisements to those embedded into other forms of media have made recognizing the presence of advertising an even greater challenge than before (Hudders et al., 2017; Shade and Chan, 2020). Newer forms of marketing (e.g., stealth marketing) that are subtle, emotionally engaging, and embedded into other forms of media, have become ubiquitous yet paradoxically more difficult to spot (Calvert, 2008; Lampert et al., 2021; Sweeney et al., 2021). It is on these grounds that advertising forms such as native advertising and influencer marketing have been criticized as potentially unethical, particularly for children (Lampert et al., 2021; Sweeney et al., 2021).

Information literacy

Developed and engaged predominantly within the area of library and information science, information literacy (IL) has a long and venerable history. IL is the ability of an individual to "(1) recognize their information needs; (2) locate and evaluate the quality of information; (3) store and retrieve information; (4) make effective and ethical use of information; (5) apply information to create and communicate knowledge" (Catts and Lau, 2008).

Unlike other forms of media education, IL has had advocacy and visibility at the national and governmental level for decades (Sample, 2020). As early as the 1970s, librarians began emphasizing its importance, particularly as a civic skill within democratic societies. In 1989, the American Library association's Final Report outlined IL as central to the education of citizens in a well-functioning democracy: "All men are created equal but voters with information resources are in a position to make more intelligent decisions than citizens who are information illiterates. The application of information resources to the process of decision-making to fulfill civic responsibilities is a vital necessity" (O'Connor, 2009).

The 1989 Final Report of the American Library Association Presidential Committee on Information Literacy further highlighted the need for students to “play an active role in knowing, identifying, finding, evaluating, organizing and using information” (Mackey and Jacobsen, 2011). In 1991, the Second White House Conference on Libraries and Information Services (WHCLIS) recommended that the US government establish a National Coalition for Information Literacy that would involve not only schools, libraries, and parents but labor, industry, government, and the public to develop “a strategic plan for the general development of skills required for information literacy” (Behrens, 1994, p. 319). The American Association of School Librarians (AASL) in 1994 adopted official national standards, subsequently adopted by the National Forum on Information Literacy: (1) defining the need for information; (2) initiating the search strategy; (3) locating the resources; (4) assessing and comprehending the information; (5) interpreting the information; (6) communicating the information; and (7) evaluating the product and the process (Doyle, 1994). Across the Atlantic, the SCONUL Seven Pillars Model for Information Literacy was developed in 1999 by the Society of College, National and University Libraries in the United Kingdom (Mackey and Jacobson, 2011). In addition to the US and UK, the United Kingdom, Australia, and Mexico adopted national IL standards. Tribal college and university (TCU) libraries Diné College in Tsailé, Arizona have developed an approach to IL that integrates non-traditional Indigenous knowledges and sources, specifically the four educational principles constituting the Diné traditional living system, *Sq’ah Naagháí Bik’eh Hózhóón* (Sorrell, 2019).

News literacy

It wasn’t until the early 21st century that news literacy education became recognized as a sub-type of media literacy (Ashley, 2020). After 2016, with the rising anxieties regarding “post-truth” media and “fake news,” global interest in news literacy has increased dramatically (Kajimoto and Fleming, 2019). While definitions of news literacy and media literacy overlap significantly (e.g., Fleming, 2014; Sivek, 2018; Swart, 2021), news literacy is centrally concerned with “actionable information” (Klurfeld and Schneider, 2014) and focuses on the “veracity and reliability of information by scrutinizing the origin of particular information” while media literacy tends to emphasize deconstructing media messages and meanings “created with that information” (Kajimoto and Fleming, 2019, p. 7; see also Maksl et al., 2015; Tully et al., 2021; Vraga et al., 2021). News literacy curricula are inspired by three educational foci: distinguishing between fact and fiction, understanding the democratic mission and freedom of the press, and more recently, using the “markers of high-quality journalism” to help students understand the “principles of solid, fact-based news storytelling compared with the increasing popular and politically polarized cable news sphere” (Kajimoto and Fleming, 2019, p. 4).

“Critical news literacy” is a nascent area, likely to explode given the increasingly urgent need. Arguably, news literacy has thus far taken a rather narrow approach, focusing on spotting hoaxes, checking facts and sources, and verifying claims. As numerous scholars argue, it’s necessary to think like sociologists (rather than journalists as per tradition of news literacy): in addition to critically analyzing individual news messages and articles, we must also understand market forces, editorial processes, and journalistic routines and practices that shape news reporting and their effect on people and societies (Ashley, 2020; Vraga et al., 2021; Kajimoto and Fleming, 2019). The five “C’s” framework of news literacy—context, creation, circulation, consumption, and content—additionally emphasizes “news literacy behaviors,” such as fact-checking or verifying claims, seeking news and political content from a variety of sources, and conscious processing of news messages (Tully et al., 2021).

Digital literacies

Originally used in the 1990s to refer to the ability to read and understand hypertext, the term “digital literacy” has come to mean much more in present times. In 1997, Glister defined digital literacy as “the ability to understand and use information in multiple formats from a wide range of sources when it is presented via computers” (Reddy et al., 2020, p. 8). Although distinguishing it from media literacy has often proven complicated (Pangrazio, 2016), digital literacy pays particular attention to personal and technological competencies for living in a digital society, while media literacy focuses on critical engagement with mass media messages. Contemporary digital literacy includes themes of online safety, access and navigation skills, online relationships, and digital rights and responsibilities. From its conception, digital literacy scholars advocate for seeing technology as more than simply machines used for information seeking, but as “cultural forms” that provide “new ways of mediating and representing the world and of communicating” (Buckingham, 2006, p. 74).

Digital literacy advocates that users be actively engaged while contributing to and creating online spaces (Knobel and Lankshear, 2008). While earlier conceptions of media literacy focus on the importance of individuals as critical consumers of media, digital literacy emphasizes consumers as participants as well. Participating in meaning making requires that users develop technical skills and knowledge of evolving digital tools to become active participants in and producers of the digital world (Erstad, 2008). Digital literacy, therefore, privileges making rather than just consuming, interactive construction rather than deconstruction, and pushes beyond critique to creation and transformation (Martin and Grudziecki, 2006).

A criticism of digital literacy is that it neglects questions of power and ideology—issues central to CML—with its focus on digital tools. Critical digital literacies essentially combines CML and DL, expanding digital literacy to incorporate critical thinking, anti-oppression, and multimodal formats of expression and representation. It can be defined as the “ability to read and create digital texts in a reflective way to identify and ameliorate the power, inequality and injustice in human relationships” (Hughes and Morrison, 2014, p. 1).

Civic media literacies

One of the newest forms of media literacy is civic media literacy (Kahne et al., 2012; Mihailidis, 2019). As its name suggests, it merges traditional media literacy education with civic literacy education, focusing on the provision of skills and knowledge necessary for students to be informed and engaged citizens (e.g., voting, being informed, knowing how to exercise rights at all levels of civic life from local to global). It seeks to move beyond critique to emphasize active civic participation.

Civic media literacy emerged from critiques that media literacy education does not focus enough on developing citizens' civic skills. Mihailidis (2019) argues that media literacy has prioritized the teaching of content-based skills such as deconstructing messages, critical thinking, and critical media production as well as knowledge of media systems and political and historical contexts but has left a gap "between skill attainment and civic outcomes [that] is apparent in the lack of action-taking or civic participation embedded in media literacy practices" (Mihailidis, 2019, p. 3).

As civic responsibilities increasingly move beyond in-person or offline forms of engagement, proponents of civic media literacy urge media education to catch up (Hodgin and Kahne, 2018). Media and digital literacy tend to neglect the importance of online circulation as a form of civic engagement (Middaugh, 2019), neglecting "discussion about how acts of circulation harm or help the goals of representation and productive public discourse" (p. 26). Audiences retain responsibility as "gatekeepers of information" (Roschke, 2018) who filter, verify, and spread information. Media literacy education is called to bring to the forefront the everyday engagement that is often local, nonlinear, and intentionally or unintentionally civic (Middaugh, 2018). Additionally, civic media literacies question how and why we see and share certain content over others, and how we come to know the difference between reliable, truthful, and/or problematic information (Damico and Panos, 2018; Hodgin and Kahne, 2018).

Gaps & future directions

Centering affective dimensions

Media literacy has historically focused exclusively on cognition, ignoring the affective dimensions of production and consumption. A review of contemporary scholarship on media education reveals an absence of sustained attention to the role of emotion and affect within media. However, scholarship in media education increasingly recognizes the urgent need of attending to emotion and affect, and challenging the rationalist traditions that have shaped media literacy approaches and theories (Sivek, 2018).

A review of nine handbooks on media education and "fake news" published between 2017 and 2018 reveals a glaring absence of attention to the central role of emotion within contemporary media, most neglecting any mention of emotion or affect and instead mentioning "cognitive bias" (Boler, 2019). Media education is thus challenged to consider in greater depth how social media and problematic information hook our emotions, and how contemporary forms of propaganda and marketing target and weaponize our emotions through the potent marriage of big data and cognitive psychology (Boler and Davis, 2021).

One way for media education to address the ways in which our emotions and affects are increasingly targeted may be engaging a pedagogy of discomfort to help us recognize when and how we are "hooked" or "triggered" by media, and to disrupt emotional habits and attachments (see Boler, 1999). Adapted to media education, a pedagogy of discomfort invites students to apply critical inquiry and skepticism to self-reflexive practices: What emotional investments do we have in particular cultural narratives and myths? What is our motivation for circulating the news we share? When and how are we influenced by emotional peer-pressures to adopt particular beliefs and identities? A pedagogy of discomfort provides a starting place to invite both students and educators to re-evaluate the unconscious emotional habits, patterns, and assumptions that shape our complex, affective relationships perhaps to media ranging from news media (Sivek, 2018) to representations of race, gender, and sexuality (Nadan and Stark, 2017; Gachago et al., 2013; Diallo and Friberg, 2021; MacEntee and Madrona, 2015).

Assessing the needs of marginalized and immigrant communities

An underdeveloped area of media education scholarship is one that considers the specific needs of BIPOC and new immigrants when dealing with affective, social, and structural dimensions of problematic information. As the need for media literacy and digital skills becomes more prevalent in everyday working life, especially as a result of the COVID-19 pandemic, the gap between global online and offline populations keeps widening. UNESCO's Broadband Commission for Sustainable Development (2020) estimates that nearly 3.6 billion people remain totally unconnected. Even countries with a high overall connectivity rate, gaps in availability, affordability, and digital skills exist in remote and marginalized communities, which often coincides with other disparities such as income, gender and race-based inequality.

Although it is not new for media educators to consider the targeting of racial and social minorities and examine stereotypes presented in the media, the current context poses particular challenges of navigating a high volume of often conspicuous problematic information, and its impact on specific communities cannot go unnoticed (see especially the section on "Global Youth Cultures" in Frau-Meigs et al., 2020). Marginalized communities are disproportionately impacted by disinformation surrounding divisive issues like immigration. Far right communities are using media in new ways to circulate hate speech through manipulated images, memes, images targeting immigrants and marginalized groups. The impact of Islamophobic disinformation dates back to the aftermath of 9/11 (Zine, 2004), however, sites like YouTube have made the circulation of Islamophobia disinformation online, radicalization, and hate speech more accessible (Lewandowsky and Yesilada, 2021). Media and information literacy should address social

exclusion of marginalized groups such as *trans* folks and refugees, which is perpetuated through sensationalist, emotion-targeting disinformation (Yosso, 2002; Krutkowski et al., 2020; Leurs et al., 2018).

Media literacy programming should consider the unique needs of immigrants who experience language barriers to traditional interventions, have a multilingual media diet, and may have cultural biases to specific information (Samtani, 2019; Katz, 2010). Educators encounter the challenge of accessing local resources that are not Western-centric to teach about problematic information, such as a program in Singapore (Dahri and Richard, 2018).

Adults as target population for disinformation media literacy

Media literacy education has largely been directed toward a youth population within primarily middle and high school settings. There is a critical need for adult-directed media education, especially outside of formal education settings (Roschke, 2018). Adults face unique barriers when adapting to evolving technologies and often require assistance setting up and using their new devices (Anderson and Perrin, 2017). Adults are described as a population that is particularly susceptible to disinformation and scamming due to an overall lack of digital literacy skills (Lee, 2018; Brashier and Schacter, 2020) and are therefore also more likely to share unverified information (Khan and Idris, 2019). Despite the “gray divide” that describes older adults as less involved and skilled with digital media, Quan-Haase et al. (2018) reiterate that they are not disconnected, rather they are users with unique needs to consider.

Checklists, fact-checking & information evaluation frameworks

A widely used information evaluation framework is the CRAAP test (Currency, Relevance, Authority, Accuracy, Purpose), created by the Meriam Library, California State University & Chico (2010). The CRAAP framework is often suggested as a crucial component in media education by librarians and educators around the world. In South Africa, 44 out of 48 of the librarian guides addressing disinformation contain links to evaluation tools such as the CRAAP framework and “How to Spot Fake News” infographic, created by the International Federation of Library Associations (2020) (Bangani, 2021). The same trend exists in the United States of America where all 21 librarian guides evaluated suggest checklist approaches to detecting fake news, mirroring suggestions provided by other American scholars, librarians and educators (Batchelor, 2017; Lim, 2020; Stein-Smith, 2017). The CRAAP checklist is also utilized and promoted in Canada (Hanz and Kingsland, 2020), Pakistan (Naeem and Bhatti, 2020), the UK (Clough and Closier, 2018), and Ireland (De Paor and Heravi, 2020).

There are other suggested adaptations to this approach in response to specific challenges of problematic information. One suggestion is the “CRAAP-based” RADAR framework, which focuses on Rationale, Authority, Date, Accuracy, and Relevance (Neely-Sardon and Tignor, 2018). Another proposed checklist is the IMVA/IN framework (Independent, Multiple, Verify, Authoritative/Informed, Named) created by the News Literacy Project (Dahri and Richard, 2018). After describing the CRAAP test as inefficient, Caulfield suggests the use of SIFT (Stop, Investigate the source, Find trusted coverage, and Trace claims) (Ojala, 2019). Lastly, the CARS checklist is also proposed as a framework to scan for Credibility, Accuracy, Reasonableness, and Support (Jacobson, 2017; Gardner, 2017).

A third group of scholars suggests that these types of information evaluation frameworks may be ineffective and unrealistic in the context of the fast-paced infodemic (McGrew et al., 2017). While scrolling, users often spend little time reading the details of the texts and are unlikely to assess what they are reading against any checklist. Others express concern that the checklist approach “bypasses the need for critical thinking” (Saunders and Budd, 2020) and limits opportunities for open-ended, inductive, and exploratory approaches to understanding a media text (Shenton, 2021).

Teaching lateral reading and process thinking

In contrast to the “checklist” solution to problematic information, many educators and librarians are advocating for the use of “lateral” reading strategies (Caulfield, 2017; McGrew et al., 2017). Lateral reading is the process of searching for information to contextualize or validate a source, “digging deep and wide” (Miller, 2018). As opposed to checklists that tend to focus on the singular text in isolation, lateral reading encourages leaping off the landing page to open new tabs instead of digging into the appearance and content features of a website.

While evaluating information sources, professional fact checkers themselves will almost immediately open up a series of new tabs along the browser’s horizontal axis, drawing on the resources of the Internet to learn more about a site and its claims, according to Wineburg and McGrew (2019). The web of relational information on the internet is used intentionally to guide the assessment of credibility as well as evaluate a websites’ reputation to decide the trustworthiness of the source (Faix, 2018). In addition to lateral reading, educators and librarians suggest that media education teaches research skills; students should engage with the research process while also learning how experts engage in research (see *News literacy*).

Engaging mindfulness techniques

In today’s media environment where entertainment, advertising, news, and memes are all integrated into one platform and endless scrolling and engagement is heavily facilitated by these same platforms, finding ways to encourage people to “stop and think” is paramount to the long-term success of media literacy efforts (Rozendaal et al., 2011)—hence, the need for mindfulness.

Although mindfulness has been referenced by media scholars in the past (Serafin, 2007), it has surfaced as a necessary quality to have within our fast-paced culture and in response to our overflow of emotionally-heightened information. Drawing on Buddhist teachings, some scholars suggest that a first step to healthy news consumption is developing awareness of when, where, and how we are exposed to news as well as attending to how we read and process news and information (Sivek, 2018). The Thai Civic Agency and Thai educators have incorporated principles of mindfulness into their curriculum as well as instruction on how media can influence our emotional states (Kleebugung, 2017).

Users are invited to read with mindfulness so as to not make snap judgments when reading about complex matters while engaged in news media (Berkman, 2021), integrating small pauses, breaths and moments of reflection and mindfulness of emotions, feelings, and thoughts. "Click restraint" is also suggested for social media users to slow down and carefully review search results before clicking (Wineburg and McGrew, 2019). Media literacy programs can encourage slow reading to regulate information flow and help maintain information equilibrium (Tsvetkova, 2017).

Conclusion

Despite media literacy's decades-long history, the evolving nature of the media landscape challenges media education to develop ever more savvy and creative approaches. Media literacy education is a dynamic theoretical field with myriad of practices, and will continue to adapt to the evolving technological and media environments, to develop citizens who are empowered, confident, and skilled in media critique and production that is relevant and applicable to its time.

Questions continue to arise: who is responsible for creating a healthy and productive media ecosystem? Should governments regulate social media platforms or does responsibility lie with the platforms to develop safeguards against misinformation and commercial exploitation? Is it up to the social media user to fact-check before consuming information, and/or should journalists develop fact-checking systems? How much responsibility lies with educators and parents?

Quite often, hopes are pinned on media education as the solution to the infodemic. However, as detailed above, it is not only citizens that affect the media ecosystem; rather this system is best understood through a socioecological lens. Forces at all levels of society—from the individual level to social and technological environment up to the policy, cultural, and ideological levels—play a part in how the media ecosystem is built and operates and how it affects and is affected by citizens. Certainly educators have an important role to play in empowering citizens and providing them with the knowledge and skills necessary to engage critically and effectively with media. But as well, responsibility for the spread and dissemination of disinformation and emotional exploitation lies as well with advertisers, social media platforms, governments and political figures. Appropriate steps are needed at all levels of society to build a healthy and sustainable media environment.

Introduction

Within the field of qualitative research, Arts-based educational research (ABER) methodologies provide artists, scientists, and practitioners with interpretive modes for conducting interdisciplinary and artful research. Arts-based educational research adopts esthetic modalities in order to identify inquiry, artfully gather or create data, and formulate theories of pedagogical phenomena in order to inform praxis, curriculum, and/or educational policies. This chapter will begin with a definition of the methodological field, a delineation of the historical and theoretical foundations of ABER as well as its dominant characteristics, followed by a discussion of its qualities and rigors. Next is a paradigm analysis and the shifts that are currently taking place in the field, such as critical methodological interventions in Critical Race Theory and New Materialism. Finally, the significance of ABER for social justice education will be articulated. Existing at the intersections of art, research, and education, ABER adopts esthetic modes of knowledge creation to generate understanding about human experience.

What is arts-based educational research?

Before articulating its imbrications with educational research, an understanding of arts-based research must first be established. *Arts-based research* (ABR) is emergent critical theorizing led by the researcher's artistic practice. As a practice-based form of inquiry, it is carried out through creative materials and techniques that give rise to data of individual or social significance. According to art education scholar James Haywood Rolling, ABR is a "flexible architecture of practice-based theory building methodologies" (1990). ABR has been taken up by a wide variety of disciplines such as social work, healthcare, and more prolifically, public pedagogy and education (Wang et al., 2017). For Rolling, arts-based research becomes arts-based *educational* research when it intersects with concerns around curriculum and educational praxis (2010, p. 104).

For the past four decades in the North American context (dominantly the US and Canada), qualitative researchers in the social sciences have recognized the limits of existing methodologies in capturing all the complexities, affects, and nuances of lived experience. Educational research, which is traditionally embedded within the social sciences, began to embrace artistic approaches to inquiry that blurred the disciplinary boundaries with the arts and humanities. ABER methodologies are simultaneously "practice, process, and product" (Sinner et al., 2006, p. 1225) and is an umbrella term that includes a host of artistic research practices. Some popular and current methods in ABER include, but are not limited to, the literary arts (Barone, 2000), the whole spectrum of visual arts, music, performance (Garoian and Gaudelius, 2004), walking methods (Springgay and Truman, 2018), photographic methods such as Photovoice (Wang and Buriss, 1997), audio arts such as podcasting, and comics. Along with these artistic practices, ABER encompasses a range of methods from qualitative research that may be mobilized at any point throughout the process from the data collection, analysis, and the representation of results (Leavy, 2009). The desired outcomes for ABER are to positively impact educational policy and praxis while enhancing perspectives through esthetic inquiry and challenging the accepted norms of social science inquiry. This is achieved by employing embodied, sensorial, and esthetic ways of knowing and making throughout the entire research process.

Educational methodologist Lather (2006) maps out 4 major epistemological paradigms in qualitative pedagogical research: *positivist*, *interpretivist*, *critical theory*, and *deconstructivist*. Using Lather's delineations, arts-based educational research paradigms may be considered. Firstly, qualitative research within the positivist paradigm presupposes that there is an objective external reality that is knowable. Alternatively, ABER supports multiple perspectives and interpretations or "polyphonous" outcomes that disrupt singular grand narratives (Rolling, 2013) and exceed "positivism's explanatory power" (Lather, 1990). ABER methodologies posit that knowledge and power are relational and are experienced differently based on one's subjectivity. Secondly, ABER is a form of

interpretive research that embraces polyvocality and multiple truths that come to be understood through dialogic discourse. Thirdly, ABER in more recent iterations, adopts critical theoretical architectures, which are intent on the goal of emancipation.

The social goals of critical theory mobilized through ABER methods is to spur imaginative solutions for institutional transformation and positive social change. Finally, *deconstructivist* paradigms in ABER often adopt poststructural theoretical discourses, such as posthumanism, that critique modernism's Enlightenment logics.

Historical and theoretical foundations and characteristics of ABER

Many of the foundational underpinnings of ABER may be traced back to the theories of American educational philosopher John Dewey (1859–1952). Dewey is credited with characterizing learning as an experience. He theorized that humans construct meaning based on an array of sensory experiences, which inevitably informs learning, famously stating that “education is life itself.” Further, Dewey advocated for student-centered approaches in education that connected curriculum with the lived experiences of learners. Dewey's theorizing has had a profound impact on pedagogical theory that challenged dominant banking approaches to education at that time.

Beginning in the 1970s, educational researchers began adopting esthetic forms in their research (Eisner, 1976; Greene, 1975). Largely influenced by Dewey's work on art and pedagogy, Stanford art education scholar Elliot Eisner furthered theory-building and methodological innovations in early arts-based inquiry and education. Eisner (1991) developed *educational criticism*; a methodology informed by art criticism and grounded in the arts and humanities. Applied to social science inquiry, the researcher, or “educational critic” analyzes educational experiences in a similar fashion as the criticism of fine art.

By the 1990s, arts-based forms of educational research were founded. Some of these practices included various forms of writing such as narrative inquiry, autobiography, poetry, fiction, and creative non-fiction. Fine art practices such as dance, creative movement, theater, new media, many of the visual arts disciplines, and music were also fused with longstanding social science research methods. According to Sinner et al. (2006), arts-based research in education involved “processes, forms (or structures), and approaches of creative practices in academic scholarship” (p. 1223). This interdisciplinary approach mobilizes a vast range of artistic methods with the goals of social science research to develop emergent methodologies in qualitative research in education.

Early artistic research largely involved the literary arts. Barone and Eisner (1997) first proposed “arts-based educational research” to describe creative imbrications of the literary arts (short stories, poetry, and theater) and educational research. They further theorized that ABER is characterized by the presence of ambiguity, accessible academic writing, and expressive work that demonstrated a high level of empathy for the participants of the study. In the context of fictional narratives in artistic research, art education scholar Leavy (2016) posits that there are three main evocations: *understanding*, *imagination*, and *empathy*. These evocations can be seen in various other ABER methods, including performance-based approaches. While other forms of educational research may seek certainty and definitive conclusions, ABER instead provides the “enhancements of perspectives” through esthetic form (Barone and Eisner, 2006, p. 96). These perspectives are often polyvocal and support a vast range of interpretations.

Barone and Eisner (2006) propose two qualifying characteristics: first, ABER revolves around “artistic activity” the objective of which is intended to expand understanding of human experience particularly educational phenomena. Secondly, ABER evidences “esthetic qualities or *design elements*” that underlie the research process and its adopted form. These design elements are not limited to the literary arts, but also extend to non-textual artistic forms, such as music, dance, and the visual and performing arts. The scholars claim the prominence of the design elements in the research determines the extent to which the research may qualify as arts-based (p. 95). The design elements are specific to the artistic medium and they speak of an attentiveness to *format*, *language*, *empathetic understanding*, and *virtual realities* (pp. 96–98). Further, they identify three genres of ABER: *narrative construction and storytelling*, *educational connoisseurship and criticism*, and *non-literary forms* (p. 98). The first genre explores the ways in which fiction and non-fiction writing can be a form of educational research. Informed by earlier theorizing mentioned above, educational connoisseurship is honed when a researcher has “refined his or her understanding and perception of a domain that the meanings the individual is able to secure are both complex and subtle” (p. 100). Cahnmann-Taylor and Siegesmund (2008) declare that visuals are not just for representing research findings, but have the potential to be “generative,” or in other words, visuals have become a mode for *creating data* (*italics added*) (p. 99). Visual ABER methods generate data, produce meaningful conclusions, and can represent them in video, performance, dance, film, music, collage, photography, and other forms without privileging written or spoken language. These methods account for the cognitive plurality that exists among educational researchers and audiences.

Eisner (2008 in Cahnmann-Taylor) outlines tensions that emerge from arts-based research in education. ABER yields a multiplicity of interpretations. For researchers who seek to build common conclusions, this can be seen as a limitation as much as a possibility. In the specificity of many ABER case studies, research reproducibility and generalizability may not be achievable. Eisner also identifies arts-based researchers' aspiration for esthetic form may override epistemological concerns, or in other words, materiality and form may take primacy over knowledge creation. Further, artistic inquiry, which can be abstract and esoteric at times, if exists within the social sciences, must be grounded in a legible discourse. Lastly, artistic innovation may be at odds with the imperatives of research to make an impact on society (p. 25). These tensions in the early articulations of ABER point to the emerging field's need to define the parameters of arts-based educational research and its position in the social sciences and its relationship to artistic practice.

In attempts to define the field, scholars have identified and named commonalities and themes among ABER projects. Cahnmann-Taylor (2008) asserts that ABER offers “a healthy synthesis of approaches to collect, analyze, and represent data in ways that paint a full picture of a heterogeneous movement to improve education” (p. 4). She names two predominant strands

in arts-based educational research methodologies, namely (1) *hybrid forms* of artistic and scientific research and (2) *art of scholarship's sake* (p. 8). The former refers to the application of artistic methods to respond to educational inquiry and meld artistic and social sciences tools and approaches. Hybrid forms affirm artistic inquiry as a valid form of research and imbue educational scholarship with expression and artistry. The latter comprises of research activity that resides more within the realm of the fine arts. Practitioners of this theme often have specialized education in a creative discipline along with training in social science. As art for scholarship's sake is preoccupied with the forward-facing aspects of the project, artist researchers apply esthetic forms to the mobilization of the study's findings to affect and connect with publics (2008, p. 10).

Emerging from a group of researchers led by Canadian art education scholar Rita Irwin at the University of British Columbia is another hybrid arts-based approach to educational inquiry called *a/r/tography* (de Cosson and Irwin, 2004). This approach acknowledges that the *a/r/tographer's* simultaneous roles as artist and researcher co-constitute their subjectivity and in turn, inform their analysis and interpretations. *A/r/tographers* engage in artmaking and writing in a way in which the writing is not illustrative of the art, but instead, extends its meanings. While *a/r/tographers* are known to employ standard forms of data collections, such as interviews and participant observation, the production of meaning is not always based on "data." Rather, meaning is also produced in conjunctions with artistic creation and interpretation (Le Blanc and Irwin, 2019). Findings from the inquiry process take on literary, visual, or performative formats and exceed exclusive text-based representation.

Given that education acknowledges multimodal ways of learning, it is fitting that educational research should also embrace capacious methods that have capacity to capture the affective, experiential, and esthetic dimensions of educational phenomena.

Qualities and rigors of ABER

Debates around artistic merit in determining research impact often arise in the field. Cahnmann-Taylor (2008) calls for a "tough critical community" of arts-based educational researchers. She claims that specific training and a culture of critique is required to measure and maintain quality in ABER. In rubrics of quality, she distinguishes the "amateur" from "excellence" (p. 11) and proposes setting up criteria to determine the characteristics of outstanding examples of artistic research in education (p. 12). Similarly, Piirto (2002) calls for extensive preparation of arts-based researchers and recommends at least undergraduate study in ABER and successful peer-review of published artistic scholarship are required for practice.

On the opposite side of the debate are scholars who agree that one does not need to be a professionally trained artist to engage in ABER (McDermott, 2010; Mulvihill and Swaminathan, 2020). Mulvihill and Swaminathan (2020) emphasize that mastery of an artistic discipline is not necessary to practice ABER, but rather, the prerequisites are, "to be interested, bold, and adventurous while being prepared for continuous learning and challenging oneself" (p. 2). It is not unheard of for social scientists to seek out the support of arts-based research specialists to assist them in pushing the esthetic boundaries of their methods.

Rather than a preoccupation with expertise and esthetic quality, art educator and researcher Morna McDermott proposes three questions to assess the success of ABER projects: *What purpose does it serve? Whom does it serve? Who does it serve? Does it affect change?* (2010, p. 7). By focusing on the mobilization of the artistic research and its ability to inspire action and change, researchers may develop an analytic for evaluation.

There is no doubt in the importance of arts-based educational researchers to engage in ongoing reflexive practice and to critically assess the rigor of their methods (Bresler et al., 2010). While some believe that rigor lies in the evaluation of the art produced or in the experience and training of the artist-researchers, other assert that space needs to be made for non-experts, such as youth, who are often the participants of such studies. Smithbell (2010) states that questions of rigor and expertise remain elusive: "there are no definitive answers to vital questions such as these. So, as new knowledge is generated, new and more complex questions develop. It is just this reflexivity, triggered by these new questions, that supports the rigor of arts-based research" (p. 1600).

Critiques of ABER include questions of validity and how it may be complicated by creativity's insistency on novelty, which arises occasionally, at the expense of utility. As artistic research prides itself on innovation, its newness must not eclipse its application in enhancing educational experience. As Eisner has said, if "arts-based research culminates in little more than a delightful poetic passage or a vivid narrative that does little educational work it is not serving its function" (2008, p. 23). The main goal of arts-based research in education is to esthetically illuminate polyvocal interpretations and to understand multifaceted lived experiences to affect diverse audiences and ultimately, instigate positive change in educational policy and practice.

Academic and artistic elitism continue pervade the field. In speaking back to exclusionary opinions, McDermott colorfully explains her anti-elitist belief that researchers and participants do not require specialized art training to engage in ABER:

[E]ven though I am tone deaf doesn't mean I don't sing in the shower. So, in doing arts-based educational research, I have to consider that while dancing in my living room lacks a quality of skill and rigor to constitute "good" arts-based educational research, I equally contend that in order to successfully work within this field I need not be Madonna either (2010, p. 6).

While amusing, this comment points to the democratic potential of ABER to invite researchers and participants alike to tap into their creativity to produce knowledge and culture as the impulse to express, to make beautiful, and to make meaning has long been a cornerstone of human experience—regardless of skill level. Given that art and the academy have long histories of exclusionary

practices and structures, such as constructing master narratives that exalt the dominant culture and writing out marginalized communities from official archives, it is vital for ABER to continually examine its gatekeeping practices.

ABER discourse will often lay claim to its “outsider” status; that due to its embrace of researcher’s subjectivity and its focus on artistic methods and affect, it challenges traditional research’s reproduction of hierarchical social relations. However, ABER’s self-proclamation of academic marginality does not move itself to innocence as it still holds potential for reproducing oppressive patterns. As white supremacy is endemic in our research institutions, so too is it evident in much of the ABER research. Researchers’ privilege has been chronically undertheorized, particularly around race, and it is only recently that whiteness is becoming a central analytic in art education scholarship (Denmead, 2021; McGarry, 2021). For this reason, art education and research has been critiqued for normalizing white privilege (Desai, 2010; Acuff, 2019), for the exaltation of Western art forms (Acuff, 2014, 2019), and its avoidance of difficult questions around sexuality, gender, race, and class (Desai, 2003).

Paradigm shifts in ABER

By conducting a paradigm analysis of arts-based inquiry and its pedagogical implications, American art education scholar Rolling (2010) determines that there are 6 arts-based theoretical models: *poststructural*, *prestructural*, *performative*, *pluralistic*, *proliferative*, and *postparadigmatic* (2010, p. 106). *Poststructuralism* acknowledges that our ideas are situated within discursive fields that require constant reinterpretation of the research subject and the researchers’ subjectivity. *Prestructural* practice refers to lived experience as research that supports phenomenological understandings. Often improvisatory, *performative* practice enacts new knowledge to an audience and mirrors the ways in which education is unscripted and idiosyncratic. *Pluralistic* practice describes the wide array of perspectives and methods that are brought together under the umbrella of arts-based inquiry. *Proliferative practice* describes an expanding praxis-led inquiry that arises from trial-and-error and is a “de/re/construction of research methodology” (p. 108). Finally, *postparadigmatic* theoretical model of arts-based inquiry characterizes a field that is rife with co-existing contrasting paradigms (p. 109) and is a growing field characterized by what methodologist Lather (2006) describes as paradigmatic “profusion” and “epistemological diversity” (p. 36). Rolling’s paradigm analysis provides a useful framework for understanding the theoretical trends of the already-existing and emergent forms of arts-based creation of knowledge.

Since its inception, ABER has sought to transform knowledge and culture, and in recent studies has been explicitly mobilized for social justice outcomes (Keifer-Boyd, 2011). In the last two decades, the field has seen an increased desire to engage with critical theory. This has led to intersections between arts-based research and critical pedagogy among scholars who work for social and political action. Gaining traction during heightened surveillance in post-9/11 society, critical ABER seeks to dismantle oppressive structures through “reflexive critique in the practice of critical research” (Finley, 2017, p. 562). Drawing from critical pedagogues such as Paolo Freire and Henry Giroux, critical arts researchers such as Garoian and Gaudelius (2004) theorize that art production, through the deconstruction of visual codes and messaging, can serve as a form of critique of day-to-day realities and a democratic form of resistance. To further distinguish research aspirations for social transformation, *critical arts-based education research* was coined. According to Finley (2017), critical arts-based educational research, “makes intentional use of imagination. It is a performative research methodology that is structured on the notion of possibility, the *what might be*, of a research tradition that is postcolonial, pluralistic, ethical, and transformative in positive ways” (p. 561). Proponents see their interventions as challenging colonial ways of thinking and being and suggest non-dualist relationalities between “researcher/researched, subjectivity/objectivity, critical and emotional thought to elaborate and create theoretical understandings” (Finley, 2017, p. 562). Armed with the ethical and political commitment to destabilize traditional power dynamics embedded in research and with its motivations to spur social transformation, critical ABER is well suited for engagement with marginalized students, audiences, and communities.

Mulvihill and Swaminathan (2020) suggest that ABER has the potential to “decenter power hierarchies while broadening our ability to accentuate a wider spectrum of human experiences” (p. 2). The need for non-hierarchical power relations is especially necessary when conducting research with marginalized communities. Taking on the poststructural paradigm, educational research with and through the arts has been known to adopt participatory art making methods to consolidate individual and collective goals for empowerment (Wang and Burris, 1997; Largo, 2012). Photovoice, for example, adopts principles and strategies of participatory action research. It blurs the hierarchies between the researcher and the subject by having the community members define the research questions and through photography, they form visual responses to their inquiries. Participants take the lead in articulating possible solutions through the accessible visual method of digital photography. Not only are the participants activated, but so too is the audience. By sharing the results of the photovoice with the public and policymakers, the ultimate goals of community empowerment & social change can be achieved (Wang and Burris, 1997).

Also embracing participatory action research, community-based art education scholar Largo (2012) contends that the researcher, also acting as the artist/educator, must be attentive to the politics of representation when working with marginalized communities. In her study with Filipino youth activists, she determined that there are two ways in which the art educator may engage with a community group: (1) as a facilitator of the collaborative creative process, and/or (2) as a “gatherer” who collects material produced by the community members and consolidates them. Ongoing reflection and feedback from the community members is essential in ensuring that representation occurs on their terms.

ABER and critical race theory

In an increasing degree, the *critical* in critical ABER gestures to radical pedagogical research that seeks to generate liberatory knowledge and culture. In more recent interventions, critical ABER has been infused with the emancipatory ambitions of critical race theory (CRT). According to Ladson-Billings (1998), critical race theory is a theoretical framework that seeks to understand systemic oppressions in society that privilege some at the expense of others. Considering growing political conservatism in the US that seeks to eliminate the study of race and society within education, the fusion of ABER and CRT allows for responsive, justice-driven, and multidisciplinary inquiry that centers resistance politics through the deployment of counternarratives and the critical imagination.

In the wake of violence connected to anti-Black racism in the US and anti-Asian racism exacerbated by the COVID-19 pandemic, approaches to arts-based educational research have merged with CRT and discourses in anti-oppression. US and Canadian education have long been critiqued as overwhelmingly Eurocentric and colonial, despite the growing diversity of these countries and in turn, schools (Acuff, 2019). In public schools and higher education, educators are confronting systemic racism and the hidden curriculum that perpetuates white supremacy. US-based art education scholar Desai (2009) asserts that educators may mobilize the arts in institutional change-making as they “develop a politics of the imagination in schools and universities that strategically uses the power of the image to ‘unframe’ the serious issues that we face today by asking critical questions that envision alternative just futures” (p. 25).

Elucidating pluralistic and performative paradigms, Bagley and Castro-Salazar (2012) fuse ABER with Critical Race Theory (CRT) in their theater-based research with Americans of Mexican descent. They apply performance methods to center the life experiences of those marginalized in formal schooling and in society at large. Their critical approach to ABER has the clear political intent of highlighting the experiences of those who have been disavowed by dominant society because of their race and citizenship. Most importantly, they engage in a purposeful discussion around the educational privileges that are afforded to white society, citing the lower attainment of college education among students of Mexican descent compared to non-racialized Americans. Operating from the CRT framework, Bagley and Castro-Salazar collaborate with practicing artists, musicians, poets, dancers, and photographers who enliven the collected life history data through their respective art forms (p. 240).

Informed by CRT and critical whiteness studies, art educator and teacher educator McGarry (2021) acknowledges her privilege as a white cisgender woman engaged in narrative inquiry around the impacts of whiteness on teaching and learning. Through the creation and performance of a fictionalized script, McGarry problematizes her discomfort around race and racism and critiques her privilege as a white teacher. She challenges the persistent notion of whiteness as neutral in studio practice (as on a mixing palette) and recognizes that the classroom is not a politically neutral site. Through the construction of counternarratives, McGarry rehearses listening to her students of color and working for their liberation.

ABER methods have also been used in teacher education programs for learning about histories of racism in education. Adopting the performative theoretical model, Fierros (2009) integrated performance ethnography as an arts-based instructional, research, and assessment method for preservice teachers in their study of the impact of the 1954 *Brown v. Topeka Board of Education*—a landmark case which declared racial segregation in public schools unconstitutional—on members of their university community. As an experiential approach to engaging with subject matter, student teachers’ theatrical performances were informed by ethnographic data gathered through first-hand interviews with community members. The ensuing performances grappled with matters of privilege, race, and institutional racism. The process was as important as the product; it served as an alternative form of assessment that permitted students to “move beyond the familiar and into a challenging set of authentic experiences that result in a deeper understanding and a greater acceptance of the unfamiliar” (Fierros, 2009). As performance ethnography involves collaboration, interviewing, and the recitation of a script based on lived experience, student teachers achieve an affective, embodied, and multisensory education in equity that allowed them to encounter and empathize with the “unfamiliar.”

This politics of the imagination fuels critical ABER’s interventions in racial justice in education by engaging with the complex intersectional lived experiences of those who have been written out of dominant narratives, by disrupting cultural norms and ideologies, and by communicating findings to publics with accessibility and affective allure. At an increasing rate, methodological innovations in critical ABER are turning to anti-oppressive and decolonial theories and practices to generate new forms of public discourse.

ABER and New Materialism

Proliferative and deconstructivist genres of critical ABER are arising under the framework of “New Materialism.” Hood and Kraehe (2017) argue that Western thinking’s insistency on human-centered research forecloses possibilities in art-based educational research. Firstly, there is a dualism between human life and the non-human, in which non-human things are seen as inactive and humans have agency over them. Secondly, there is an absence of theorizing on the contributions that materials and objects have in the creation of art. New materialist scholars propose that critical ABER account for our “interconnectedness with things—lingering within wonderment, struck by the power of the things that pull us out of our routines” (p. 33). New materialist thought presupposes that all matter has agency and makes space for emergent methods in art education practice as research.

Many artists have long been known to hold a special consideration for the essence of material. New materialist approaches to research are attentive to this ethical impulse and thus, create speculative inquiries based on these considerations. The emergent nature of this kind of research often generates new questions and directions throughout the process and often resists prescriptive

and positivist processes. In considering the more-than-human point-of-view in critical arts-based educational research, new possibilities for inquiry and praxis surface.

Paradigmatic profusion in ABER continues to evolve. This methodological diversity includes emergent forms of research-creation in education such as the integration of participatory esthetics and socially engaged art (LeBlanc, 2019), sustainability art and land-based pedagogies (Hauk and Kippen, 2017), and walking methods (Springgay and Truman, 2018; Patterson, 2021). Demonstrating a postparadigmatic era in which various theoretical models coexist, these new directions are attentive to esthetic provocations generated by space, ethical engagement with ecologies, and non-humancentric perspectives that consider the agency of land, and the politics of movement and embodiment.

Implications of ABER for diversity, democracy, and social justice

In social justice education, new knowledge that emerges from marginalized positionalities decenters dominant perspectives. Within the margins reside transformative potential to reconfigure what we know and how we know it. Arts-based methodologies, as they impact educational inquiry and curriculum, unsettle former ways of conducting research and knowledge production, and thus, provide new frameworks for theory-building and praxis. They capture points of view that may otherwise go unnoticed by more conventional research methods.

When applied to social justice education, arts-based inquiry allows for subjects to engage in affective, experiential, and embodied ways of knowing and making, often revealing truths that cannot be captured through positivist research approaches. As practices of representation, education and educational research have the capacity to replicate existing oppressive power relations or contest them. By circumventing the use of specialized language and modes of data gathering that alienate non-academic audiences, art-based educational research attempts to upend longstanding power imbalances between researcher and subject and between teacher and student. Further, ABER often operates within participatory and collaborative modes, allowing participants to directly engage in defining the research problem, data gathering, and the mobilization of findings to an audience. This democratic approach to research can be considered empowering, especially to historically marginalized communities who are granted a greater amount of agency at every stage of the research process. By fusing scholarly investigations with artistic expression, participants connect personal experiences with broader social concerns, such as inequity and oppression. For these reasons, critical researchers find great value in artful inquiry for the opportunity to bring in those who have been excluded into meaningful educational reform and social transformation.

An undeniable benefit of ABER is its potential for wider knowledge mobilization beyond the academy. It provides an accessible and engaging means of presenting findings to the general public, thus transcending educational and linguistic obstacles that characterize much of mainstream research (Wang and Burris, 1997). For example, in communicating research findings to classroom practitioners and students, esthetic modalities are more likely to garner successful reception than an academic article laden with specialized language. The esthetic quality of the research process and outcomes draws on affect and “awaken” audiences to the unnoticed (Barone, 2002). This in turn, begets empathetic responses that have the potential to inform action and positive social change. The accessibility and allure of many ABER projects make these methodologies enticing for researchers who seek to make meaningful impacts on the communities to whom they are accountable.

Museum education and the idea of building capacity

Museums are the learning institutions of democratic societies, fostering the development and growth of people of all ages and introducing learners to the scientific, historical, art, living, and other collections and resources of society. Museums, including art and science museums, historic houses, aquariums, zoos, and botanical gardens, provide physical and virtual spaces for people to think and act individually and collectively. It is in museums where families, peer groups and friends, school groups, and individuals can choose what, when, and how they learn as well as gather for leisure-time activities and events (Falk and Dierking, 2012). Pre-COVID-19, in the United States alone, 900,000,000 people visited museums annually while museums invested \$2 billion on education activities each year (AAM, 2021).

This essay examines how museums have and continue to “build capacity” among both museum visitors and staff before, during, and after the COVID-19 pandemic, building upon John Dewey’s view of capacity as “an ability, a power; and by potentiality potency, force,” (Dewey, 1916, p. 41) and “a force positively present—the ability to develop” (p. 42). For Dewey, the older and more experienced and knowledgeable members of a society determine how younger or more immature citizens should develop and grow in a positive sense, so that those more inexperienced members can eventually and collectively help society, itself develop further.

Before the pandemic: museums as learning institutions helping to build capacity

The emergence of museums in society is linked to goals of education and access (Protas, 2019), whether we understand museum education as beginning with the 1781 opening of the Belvedere Museum in Vienna or the educational work and outreach of John Cotton Dana and Louise Connelly in Newark, NJ, in the early 1900s (Mulryan, 2001). Museums play a key role in helping a society figure out how to facilitate learning by creating spaces and programs that fit the needs of people in surrounding communities and building museum visitors’ capacities for thinking, reasoning, doing or making, and being overall productive members of society through exhibitions, educational programs, and experiences designed to facilitate and foster the acquisition of a range of knowledge and skills.

Prior to March 2020 and the spread of the infectious disease COVID-19, visitors had come to understand that museums could be used to support their own curiosity and interest; support the learning needs of others (like children); build personal or professional identities; refresh and rejuvenate themselves; and explore and do novel things (Falk and Dierking, 2019). This understanding on the part of visitors reflects that educators in museums had, in many cases, moved away from a transmission model of education to one that incorporated theory and research from different fields of study (Zimmerman and Martell, 2008).

Scholars like Weil (1995) and Martin and Toon (2010) had called for museum staff to view visitors not as empty vessels to be filled with knowledge but as equal contributors to meaning making in museum spaces, particularly through the use of narrative and storytelling. In fact, museum staff came to use a range of theoretical and conceptual approaches to teach visitors, including social constructivism, identity formation, interest, social learning theory, and experiential learning, among others (Hohenstein and Mousouri, 2017).

Much research in science museums examining varied approaches to teaching found evidence supporting, among other aspects of science learning: participating in scientific activities and learning practices with others and using scientific language and tools; and thinking about oneself as a science learner and developing an identity as someone who knows about, uses, and sometimes contributes to science (NRC, 2009, p. 4). Meanwhile, though some educators and other museum professionals saw themselves as neutral guardians of cultural heritage (Audunson et al., 2019), other museum staff hoped to push past “a preoccupation with education, entertainment and consumption,” to bring about important changes in society (Janes and Sandell, 2019, p. 1).

As a profession, people who worked and taught in museums prior to the pandemic were encouraged to face their unconscious biases; not hinder progress by debating definitions; understand inclusion as central to the effectiveness and sustainability of

museums; see systemic change as vital to long-term, genuine progress; and view empowered, inclusive leadership as essential at all levels of museum operations (AAM, 2018). In short, both museum visitors and workers in museums built capacity, including intellectual, social, and for the general benefit and well-being of society.

In 2019, the United States Federal agency, the Institute of Museum and Library Services (IMLS), and the non-profit organization, Partners for Public Good (PPG), conducted a mixed-methods research study focused on this idea of building capacity on the part of the museum as an institution. IMLS and PPG defined museum capacity as “the generation of resources or support intended to help an institution enhance its ability to fulfill its mission or purpose (i.e., any activity or support that is focused on the health and sustainability of the museum rather than on specific exhibitions or programs,” (Hausmann and Hackney, 2021, p. 7). And, though museum missions are as diverse as their collections, study results included that, for all museums, capacity building must link directly to audience responsiveness; is driven by those with power such as funders and museum board members; and is complex and requires a holistic change management approach and commitment from leadership and staff. Researchers also found that museums experience different barriers to participating in capacity building due to such factors as funding and staff time; a perception of museum uniqueness may be a barrier to the application of capacity building best practices from other sectors; and infrastructure, including availability of resources, within the museum sector is insufficient to build museums’ adaptive and relational capacities and address diversity, equity, accessibility, and inclusion (DEAI) issues (Hausmann and Hackney, 2021).

When the COVID-19 situation occurred, however, research and capacity building efforts were stalled or halted as museums faced challenges, including how to remain operational, keep staff employed, and decide whether to suspend all educational programming or make it remote (Greenberg, 2021). Museum professionals had to ask themselves, “What does it mean to be a museum or a library when no one is coming through the doors?” (IMLS, 2021, p. 6).

During the pandemic: challenges and responses

During the pandemic, challenges to museum education in the United States included state governments forbidding in-person field trips for school groups (Young, 2021) and mass layoffs of museum educators (Fonda, 2021.) Museum educators who remained employed were forced to contend with the “digital divide” and reexamine how existing technology platforms and software could help all members of a community; how preexisting museum education program models could be applied to digital settings; to consider forming digital access partnerships with other organizations to support museum content delivery; and to develop educational programs based on the specific needs of community groups and families, particularly those with limited access to technology (Bailey and Sautner, 2021). Some museums repurposed and adapted distance learning workshops and other materials developed prior to the pandemic (Eyl and Stirn, 2021) while other museums helped educate the public about pandemics and the history of vaccine distributions (Øverland, 2021) or used arts and culture-based approaches to increase COVID-19 vaccine confidence (University of Florida, 2021). Innovative programming paradigms designed to address the new, pandemic-based capacity building needs of visitors emerged alongside new museum workplace practices that adhered to local, state, and federal mask and quarantine mandates and related limitations such as timed ticketing, reduced hours, fewer staff, and the use of hoteling as opposed to assigned workspaces for museum professionals (Merritt, 2021).

One key area of exploration for museum workers, especially in the United States, catalyzed in response to tragic events, including the murder of George Floyd—an unarmed Black man killed by a Minnesota police officer during an arrest—and coincided with the emergence of the pandemic, shining a light on issues of race and racial dynamics. Scholars called for the use of theory, including critical race theory, to inform understanding of museums’ rootedness in colonialism and imperialism (Moore, 2021). Theory could help shape daily practices in museums, including “creating spaces, opportunities, advisory capacities, and more to elevate the presence, power, and voices of historically marginalized communities” to share authority and ways of knowing (Moore, 2021). Museum professionals revisited past efforts addressing structural racism in museums and called for museums to listen to the experiences, data, and insights of people of color; and create a new paradigm addressing inclusivity of staffing, collections, and interpretation as well as equality of access to resources. A goal for the professional would be to develop a philosophically-based action plan to be morally and culturally responsive while empathic, respectful, and inclusive so as to transform institutional policies in positive ways (Museums & Race: Transformation and Justice, 2021). Civic-minded museum staff could therefore push themselves and visitors to make society better, shunning pervasive elitism, and including all voices.

Moving forward: convergence

As each country works to get out from under the pandemic situation and away from the impacts and effects of COVID-19, dialogs around equity, inclusivity, accountability, allyship, and the well-being of all of society’s members (Falk, 2021) are driving new approaches to capacity building in museums (See list of Relevant Websites for examples). These discussions align with Dewey’s thoughts about capacity development as strength-rather than deficit-based, because movement is being made to recognize and embrace all people as equal contributors, as both meaning makers and actors with the power to grow individually and as a collective whole. Museums provide safe if not always neutral spaces where people can seek answers to questions not only about specific disciplines like science and history but engage in conceptual work about what it means to be a productive, contributing member of society. The museum field is advancing toward a new understanding that agency on the part of individuals and institutions alike

transcends disciplinary boundaries as well as the limitations of physical spaces. Finding solutions, for example, to the challenges of climate change, racism, and inequality and oppression will happen through a convergence of museums, museum visitors, and museum professionals that is epistemological and ontological.

Introduction

The concern and context of this chapter is women's learning in poor communities in an informal context and poses questions for social transformation. The purpose of this chapter is to explore the interconnectedness between learning and social change in different sites of informal learning and reviews women's learning in community development, social movements and virtual spaces.

The conceptual and analytical framework of this discussion is located within a theoretical paradigm of learning which is multi-disciplinary and includes adult education, development studies, feminist and popular pedagogy and draws on sociology and psychology. In this conceptual framework, women are not characterized as a universal group, they have competing ideologies which are shaped by socio-economic forces, history, context, and agency which influence their learning and life chances which are the opportunities to increase one's position in the social class structure.

Formal education is defined as long-term, planned, certified, takes place in a formal institution, is hierarchically structured and involves the transmission of knowledge which is chronologically graded. It includes education from primary schools through to university and includes professional training programs. On the other hand, informal learning is usually unplanned, short-term and is not certified.

The context of this discussion is situated within poor communities. I draw on various international examples to illustrate (1) women's learning in communities, (2) in social movements and (3) virtually. However, poor women often experience oppression resulting from patriarchy which may affect their ability to access formal learning. Patriarchy (social relationships in which men hold the power) takes different forms but usually includes gender-based violence (GBV), such as sexual, physical or emotional abuse. This was illustrated by the formation of the #MeToo movement when women across race, gender, class, and ethnic divides stood up, made themselves visible and added their voices against sexual exploitation.

Rather than education, which is associated with formal institutions, women in poor communities receive informal learning which is defined as learning in the everyday, in the family and while engaging in activities such as community development and social movements. Informal learning is not accredited and institutionalized therefore it is difficult to measure as there are no set tangible outcomes. Women receive tacit knowledge through socialization and life experiences as well as from others in communities of learning (Foley, 1999; Lave and Wenger, 1991). Brookfield (2001: 149), drawing on Malcolm Knowles (1975), maintains that informal learning is self-directed learning that often takes place through groups of adults united by a common purpose who exchange information, ideas, skills, and knowledge with other members in the group. This knowledge sharing often includes problem solving and the creation of new modes of practice or new forms of knowledge. Walters (1998: 436) defines informal learning as "often unplanned, incidental learning which occurs while organizing community soup kitchens through savings clubs and religious organizations".

In many countries, poor women have been excluded from formal education. The reasons for their exclusion include apartheid legislation, as was the case in South Africa; a lack of money; difficulties accessing educational facilities; and social/cultural or religious practices and prejudices which dictate that women must stay at home to care for the family (Ismail, 2006:12). For example, in 2021, after the United States of America's (USA) withdrawal from Afghanistan, the Taliban closed many schools for girls (<https://www.usip.org/publications/2022/04/talibans-ban-girls-education-Afghanistan>).

When formal education is lacking, women learn in informal ways that are geared to their everyday realities and support them in their daily struggles. In many countries, informal learning has developed so that excluded groups have opportunities to learn. Non-formal programs funded by the World Bank or UNESCO provide a systematic transmission of knowledge and skills which add to women's informal learning (<https://www.worldbank.org/en/topic/gender/overview#2>; <https://en.unesco.org/themes/education-and-gender-equality>).

In some cases, the adult learning programs use popular and feminist pedagogies which have led to social activism and political education (Walters, 1989).

Many women have proven that they can learn and perform equally in all major scientific disciplines. However, the patriarchal belief in women's cognitive inferiority persists as well as the prejudice that women are unable to rise above the practical and emotional preoccupations of everyday life and are characterized as irrational, passionate and sensuous (Pateman, 1990). On the contrary, radical popular education and feminist pedagogy have had an important impact on these prejudices by examining the political identities of women, focusing on questions of transformation, the role of the collective in mobilizing for action and the link between learning and changes in political consciousness. In the next sections I discuss the conceptual framework and women's learning in informal sites.

Conceptual framework

Popular education and feminist pedagogy draw on Paulo Freire's (1983) theory of challenging dominant ideologies of learning. Underlying both theories are certain assumptions about experiences as the basis of knowledge, oppression, consciousness raising, and how education can lead to women's empowerment.

Popular education is a term used in informal contexts to define educational practices which aim to challenge injustices and oppression. A common understanding of popular education is that its main objective is to enable participants to understand the contexts in which they live and act (Walters and Manicom, 1996; Weiler, 1991). The curriculum is drawn from the concerns and interests of the participants, and the critical moment is when participants can name the issues and analyze the forces within themselves and other dominant forces that prohibit progress (Arnold et al., 1991:25–29). Then a plan of action is developed based on a social analysis of the context and political forces (Walters, 1998). Feminist pedagogy challenges the male bias in popular education with a focus on challenging women's subordinate position (Walters, 1998). It includes issues of identity and culture and has theorized the different meanings and forms of power.

These pedagogies focus on the experiences of the learners in all considerations of teaching and learning. Learners analyze their experiences by reflecting, evaluating, and reconstructing them in order to create knowledge and make meaning. There is a strong organic connection between education (gaining new knowledge) and personal experience.

There is a dialectic between action and reflection. In the process of action and reflection, people's attitudes and values change, and their experiences are used to raise awareness and lead to a change in consciousness and the material position of women (Jarvis, 1987; Weiler, 1991). The methodologies used in popular and feminist pedagogy include creating a democratic space to offset power between the educator and participants and participation through group discussions and workshops where the content considers the needs and interests of the participants (Ismail, 2006:29).

Popular and feminist education is not neutral but political therefore there are debates about women's empowerment and conscientization which lead women to examine power relationships, to take charge and show agency in dismantling oppressive structures. However, sometimes women may choose to act strategically and continue with the norm. The feminist contribution is to make the personal political and to challenge patriarchal social relations (Walters and Manicom, 1996). The next section discusses how issues of power are addressed in the learning process.

Power in the learning process

The way in which popular and feminist educators have managed to address power relationships between themselves and learners is by sharing their knowledge with learners who apply it to their situation in a process which does not deny inequality of knowledge but which is based on co-operative and democratic principles of power. This they argue (Rowlands, 1998; Rogers, 1992; Kaplan, 1997) can be achieved if the attitudes of the educator include complete respect for each individual and for the group, humility, a willingness and eagerness for learning to be mutual and commitment to the empowerment process. Jo Rowlands (1998) argues that the dominant understanding of power within the social sciences has been that of "power of" or "power over", whereas a feminist understanding should be a dynamic one, which conceptualizes power as a process rather than a particular set of results. She conceptualizes empowerment as a process that cannot be done to women but must emerge from them. In Rowlands' (1998) study of how to assess the impact of empowerment among women in an educational program in Honduras, she concluded that empowerment took different forms in different spaces of women's lives. She argues that the process was personal and unique even though one woman may go through the same experiences as the collective. In turn, the personal empowerment of women with their husbands and other family relationships can be different from the personal and collective experiences (Ismail, 2006).

In a recent feminist book on this issue edited by McGee and Pettit (2020), power is conceptualized as "iterative, intersectional, and multidimensional, departing from the dualist 'agency vs structure' lenses that tend to prevail in theoretical debates" (McGee and Pettit, 2020: 4). These writers see power as visible (open commands and laws), hidden or shadow power (the setting of agendas of what can be said and done and what cannot be said or done) and, above all, invisible power. Invisible power includes "the socialized norms, beliefs and behavior shaping the boundaries of what is considered politically possible" (McGee and Pettit, 2020 cited in Rogers, 2020: 170). The "Me Too Movement" highlighted the invisible power that allowed men to continue to sexually abuse women even when these offenses were disclosed and found to be true. Spivak (1994) posed the question whether researchers can speak for poor women without violating their reality. Her article, "Can the subaltern speak?" (1994) has provoked a new consciousness among researchers and development practitioners to examine their assumptions, to remain vigilant about the

purposes of research and how women are represented in publications. In all the different learning situations discussed below, and those not highlighted in this chapter, the issue of power is ever present.

Learning in community development

Rogers (1992: 20–21) explains that learning is the process of making changes to knowledge, skills, attitudes, value systems and behavior and that learning includes goals, purposes, intentions, choices, and decision making. According to Anderson (1983), community is a sociological term that is not tangible and may also be defined as imaginary. It is also a term that often invokes sameness, a communal spirit, a geographical space, a sense of belonging, a language or a culture that unites people. It is a contested concept and often hides different forms of oppressions. Similarly, development is a term that has lost its promise of poor countries catching up with the rich (Kothari et al., 2019). Kilgore (1999) argues that theories of learning in community can “provide a framework in which we examine how people construct shared visions of social justice and learn and act together to promote these shared visions” (Kilgore, 1999: 201).

Women are usually the key actors in community issues as their lives are affected by the everyday struggles of survival. However, within communities, there are power struggles and hierarchies, such as those in patriarchal communities, in which women suffer various forms of gender oppression. These include structures such as chiefs in rural areas and local government authorities, landlords or gangsters who exert power and control over sections of a community in an urban environment. Even within communities, there are struggles for social change and for the same resources. There are also economic divisions, unequal gender dynamics, power struggles over leadership and corruption, or mismanagement of funds which impact the solidarity of the collective.

The book, *Playing with Fire* (Sangtin writers and Nagar, 2006), tells the stories of seven women village level activists from different religions and castes in rural India, who were employed by the Nari Sumata Yojana—a Non-Governmental Organization (NGO) which seeks to empower rural women of the Dalit castes (lowest castes). In this book, these women analyze how the different layers of the social units oppress women, firstly at the unit of family life, secondly at the community level and then thirdly at the wider social and global levels. Their reflections illustrate that the dominant ideologies that oppress women are interconnected and therefore it is difficult to tackle one oppression at a time. The women write that each social unit is filled with “poisons of casteism, classism, communism, and sexism” and that “these blend into one another [...] [so] that their bitterness remains intact on our tongues” (Sangtin writers and Nagar, 2006: 16). Their stories illustrate that communities may also be a prison for those who go against community norms.

The feminists, Weiler (1991) and Thompson (2000), argue that women in a single community do not form a homogenous category with a single ambition and consciousness but may be divided among themselves. Third World postcolonial feminists, Alexander and Mohanty (1997), argue that geography, genealogy, and colonial histories are important factors that impact on agency and interpersonal relationships while the postmodern feminist, Mouffe (1992), believes that there is not one absolute discourse or truth to development and equality in society, nor one linear path to it.

Feminists, Lee and Weeks (1991), maintain that the structure of women's lives militates against community building as women may be married and obey the demands of their husbands, they may work in a paid labor force or they may be preoccupied with domestic labor and family commitments. These arguments are valid but the history of women's movements and liberation struggles indicates a rich culture of women participating in community and mass democratic struggles (Foley, 1999; Ismail, 2015).

Poor communities have a history of working with “outsiders” that include state community workers, social activists, development workers or global organizations, such as UNESCO, that come from a range of political persuasions. The outside agencies' relationships and interactions with communities have implications for how learning is supported and how society is changed as the role of outsiders is to construct new ways in which the community sees itself. In this process, the members of the community learn that they need to become active citizens for the realization of their democratic rights (Shaw and Martin, 2000: 409). This is both a political and an intellectual challenge and allows for “those who have experienced social exclusion to have a voice” (Fiona Williams cited in Shaw and Martin, 2000: 410).

Many global institutions working in development contexts, such as UNESCO and UNICEF, often showcase uncritical and romantic stories of women in development on their websites which further entrenches the view that communities are homogenous. However, there are many examples worldwide to illustrate that women do work together across many differences as shown below.

In 2020, during the pandemic brought on by the COVID-19 virus, many women played critical roles in their communities by providing food, water, care, and information on health practices to vulnerable persons. Although women are on the frontlines in their homes, communities, and health care facilities, they are often excluded from the community, governance structures and national decision-making processes that determine their response (Fuhrman and Rhodes, n.d.).

The South African Homeless Peoples Federation is an umbrella body for the collection of savings of groups of poor African women living in informal settlements. These small daily savings, together with a state subsidy, have enabled many women to build their own homes. The women say that the savings form the cement that binds them together in solidarity. The women, firstly, learned to save and then went on to learn other skills, such as brick-laying, designing, and building houses. In the process, they also gained political skills to negotiate with government for land and housing subsidies. These learning outcomes took them beyond their own communities as they formed alliances across the globe and exchanged knowledge and skills with other women as far afield as India, Brazil, and the Philippines. They connected intimately with the Slum Dwellers in India (SDI) and others in the Asian Coalition for Housing Rights (Ismail, 2015). These exchanges of knowledge, skills and political strategies can be compared to

Alexander and Mohanty's (1997: xix) "transnational border crossings" in which women from similar backgrounds and colonial histories in different geographical spaces engage in feminist praxis. In these cross-cultural exchanges, local knowledge becomes international knowledge that counters the limitations of local knowledge and opens up spaces for poor people to become experts for each other, locally and internationally (Mayo, 2005: 113).

The examples above illustrate Lave and Wenger's (1991) notion of learning in "communities of practice" as they foreground learning rather than teaching and argue that learning is best viewed as a social practice. A "community of practice" is formed by a community's pursuit of engagement with the rest of the world. If the experience is meaningful, Lave and Wenger (1991) conclude that people are learning. For the community, learning is the vehicle for its development and transformation. In this process, people act as a resource, exchange information, help to make sense of situations, share new ideas, keep each other company and add life to each other's working days. Critical to this theory is identity formation as Lave and Wenger (1991) show that learners are engaged in the co-construction of knowledge through participating in a continuing dialogue between themselves, the other people they are interacting with and the systems, technologies, and the wider culture of that setting. There is an experience of meaning because, for them, learning is a social phenomenon and reflects the social nature of human beings.

The various responses to the pandemic in which women took the lead, cited in this chapter, are illustrative of Lave and Wenger's (1991) theory as, in many communities, women responded to the crisis to ensure that their communities were safe, had basic needs and were organized. For example, in Kerala in India, a state with a high literacy rate, empowered women's self-help groups, such as Kudumbashree, formed thousands of WhatsApp groups connecting poor neighborhoods. These WhatsApp groups were used to educate on key safety measures as advocated by the government during lockdown. They also initiated community kitchens, with the support of local community organizations and NGOs, to provide free meals to many vulnerable people (World Health Organization [WHO]; JASS, 2021).

Some feminist literature discusses women's learning from a psychological point of view. This literature suggests that there is a reciprocal relationship between individuals and their communities (Kilgore, 1999). Benky et al. (1986) describe how women, who come from disadvantaged backgrounds and seek medical advice in a health clinic, learn more by listening and receiving knowledge from other poor women who devote themselves to the care and empowerment of others by listening and understanding or by teaching others what they know, and that this experience gives them more confidence. Benky et al. (1986: 228) model shows that learning helps women "toward community, power, and integrity [and that] such an education facilitated the development of women's minds and spirits".

In a different study of working-class women and their relationships to knowledge, Wendy Luttrell (1988) argues that knowledge, which develops in the collective and from practice, is often more reliable than expert knowledge. Luttrell (1988) believes that common sense knowledge is experienced differently by white and black women. Patricia Hill Collins (1995) expresses a similar view and says the way in which black women claim their knowledge as "mother wit" is perceived, in part, as their ability to work hard and to obtain material things without a man's support. Often women refer to their common-sense knowledge as intuitive and stemming from feelings. Black women also regard their ability to deal with racism as another form of real intelligence, which they share with black men against the ignorance of whites. This relates to Luttrell's (1988) distinction between knowledge and wisdom. She says that black women are reminded of their collective identity as oppressed women daily and this mitigates the reminder of their individual identities as women (Barr, 1999: 108–111). These solidarities were expressed in the "Black Lives Matter" social movement in America when black women and men marched against police brutality and the indiscriminate murders of black people by the police.

Learning in social movements

Women's movements, like most social movements, are issue based and are associated with a broad range of struggles that include national liberation, human rights, the democratization of authoritarian regimes, working class struggles, gender specific grievances and concerns over basic needs. In these social movements, women are organized around a range of issues that include: political and legal rights; violence against women; reproductive choices; abortion; sexual freedom; employment opportunities and discrimination; dowry deaths; access to land, houses and finance; sustainable development; and the environment. An example is the story told in the film, *Women Hold Up the Sky* produced in 2019 by the WoMin Alliance, of how women activists, affected by mining and other forms of large-scale extractives in South Africa, Uganda, and the Democratic Republic of Congo (DRC), are deeply engaged in resistance and an active struggle to take back control of their land, their rights, their bodies, their lives, their livelihoods and their environments (WoMin, 2019).

Social movements generally lose momentum and may dissolve once the issues under protest are resolved (Tarrow, 1994). These movements may not be concerned with the capture of state power and revolutions. However, women may be consciously or unconsciously building a countervailing power to dominant state power.

Eyerman and Jamieson (1991) argue that social movement activists learn by doing—people learn by moving from discovery to articulation to application and to becoming part of an organization. The knowledge that is created is therefore a collective process. The movement creates a space for new kinds of knowledge and ideas, and new relationships to develop. The creation of knowledge as well as identity formation is central to the movement. Knowledge is created in a series of meetings, between meetings, and, most importantly, between movements and their opponents. The new ideas produced on specific issues and topics are shared by the participants. The focus is on creating a movement identity, which is a cognitive praxis. The actors taking part in the process of

articulating a movement identity are called “movement intellectuals” (Eyerman and Jamieson, 1991). Illustrative of these theories are the new environmental and climate change social movements which are youth led, for example, by Greta Thunberg who started skipping school in 2018 to strike for climate action outside the Swedish parliament in Stockholm. The movement quickly went global, and she became the symbol for youth activism against a greedy corporate world (Marris, 2019).

The “Me too Movement” in which women shared their experiences of sexual abuse and harassment in the workplace is another example of a movement in which women from all spheres of life and across classes, races, genders and ages found a common cause, broke their silence, and collectively supported one another to envision a society in which patriarchy is dismantled.

Newman (2005) outlines how to use information and knowledge as resources for critical skills such as challenging power relationships. The Treatment Action Campaign (TAC) in South Africa exemplifies this characterization. The TAC built a movement which focused on removing the negative stigma attached to HIV/AIDs sufferers by brandishing the words “HIV Positive” on T-shirts which provoked questions, raised awareness, empowered the wearers and created solidarity between those infected and affected by HIV (Ismail, 2017: 161). The TAC took the government and huge pharmaceutical companies to court to provide affordable medicines and, in this process, embarked on an education campaign to counter the messages from government that HIV/AIDS is primarily a disease of poverty which can be cured by eating garlic and potatoes.

Foley (1999) and Wildermeersch and Jansen (1997), through case study research, conclude that learning cannot be determined by measuring cognitive skills as learning is not only about acquiring skills and knowledge but is also about change in attitude and behavior and does not involve a timetable or organization of time. Learning is national and international as social activism moves knowledge beyond its national borders but they caution that not all learning is progressive or linear.

An example of transnational learning or learning across borders from others was present in the Dakota pipeline protests in which Native-American women were at the frontline to protect the rivers against the oil corporates and gained global support against oil corporations and the USA government. In Mexico, Karen Thunder learned that pipelines were coming down from Canada and then through the United States to Mexico. As she learned about pipeline struggles across the borders, she realized that this was a global issue. In her travels after Standing Rock, Thunder listened to stories about rivers and lakes that need to be defended from oil/gas and mining extraction, known as extractivism (Barnett, 2019).

Learning in virtual communities

Virtual communities began with the concept of networking which was used mainly to co-ordinate a more efficient use of resources but is now increasingly used to exchange information, as an advocacy tool and for learning about or from different social and economic struggles.

Acharya and Robinson-Pant (2017), who research women's literacy and health programs in Nepal, emphasize the need to look beyond planned development programs as people's lives and literacy learning opportunities are rapidly changing due to new technologies, which have increased mobility and globalized markets. They argue that the boundary of literacy learning has expanded with the development of technologies and can no longer be confined to formal or non-formal education programs. Access to mobile phones and computers has expanded people's choices and use of communication media, even in remote areas. Communication choices and cultures have become more personalized and covert, offering new spaces for women and men to develop relationships and transforming indigenous social structures. Acharya and Robinson-Pant (2017) cite the following examples from their research with the Gurung community in Nepal:

The Gurung community has a specific cultural practice known as “Rodhighar” particularly organized to facilitate socialization among young men and women. Today, access to mobile phones offers young people the opportunity for virtual socialization, replacing indigenous social practices like the “Rodhighar” but there is some evidence that mobile phones are having a negative impact on gender equality and health enhancement. Recent research on the misuse of mobile phones by young boys and adult men has shown serious implications for women's mental and physical health.

Another illustration from Tanzania in Africa was the development of a mobile application (app) for informal women traders to market their agricultural products. This innovation means that the women do not have to travel to informal markets or go door to door to sell their produce. However, the new technology does require a substantial investment in a smart phone, batteries and internet connectivity, all of which are difficult for some women to purchase (Kaoinga et al., 2016).

In 2020, the world was caught in multiple crises that included the COVID-19 pandemic, economic recession, climate change, environmental degradation, and racism. During this time, learning about the virus took place mainly informally and virtually as formal education institutions were closed, and people were not in physical contact. People learned informally about the origins of COVID-19, how it spread, its impact, the possibility of a vaccine, the treatment of patients and how countries reacted to contain the spread of the virus. There was a mass of information, some of it based on science (mainly from the World Health Organization), some on experiences of living with the virus, in addition to misinformation and alternative views that the pandemic was a conspiracy. There was also widespread use of community radio and television in countries in which internet connectivity was poor. Posters and pamphlets were put up in public places to alert people to wear masks, sanitize hands and to practice social (physical) distancing.

Social media to disseminate information used included Facebook, Twitter, WhatsApp, Instagram, Webinars and Watch parties. Statistics of the spread of the pandemic globally were provided graphically in dynamic ways. However, these forms of online learning highlighted the digital divide and therefore calls were made for Digital Social Justice, especially in rural areas.

Women-led trade unions and NGOs ensured that workers had personal protective equipment (PPE) and many civic organizations urged the state to supply PPEs at schools and public facilities when they reopened. Women in Informal Employment: Globalizing and Organizing (WIEGO, 2022) argues that many informal laborers are “essential workers”, including waste-pickers and street vendors selling affordable foods and should be included in the free distribution of PPEs. In Mexico, a feminist trading platform supported the exchange of goods and services for vulnerable workers, with a deeper objective of fostering women’s solidarity (International Institute for Environment and Development [IIED], 2020). In Sudan, MANSAM, a coalition of women’s organizations and civil society groups, took on the pandemic by making masks, donating needed supplies, distributing posters with essential information and raising awareness about the virus via social media (Diop, 2020).

There is evidence that the COVID-19 pandemic disproportionately affected women and girls therefore it was important that COVID-19 responses were gendered and that women and girls were able to participate in making the decisions that affected them (JASS, 2021).

Conclusion

The theoretical and conceptual framework used in this chapter drew largely on theorists from feminist, popular education and critical perspectives to discuss women’s informal learning in contexts such as communities, social movements and virtual spaces. The analytical concepts identified were experiential learning, reflection, action, participatory democracy, conscientization and empowerment. It emphasized that women and communities are not homogenous categories and that learning needs to be analyzed on the micro-level in terms of wider socio-economic and political forces. It characterized informal learning as occurring on many levels and that it was tacit, incidental, active, planned, interpretive, instrumental, critical, intellectual, emotional, and physical. Learning in the various spaces outlined is a collective experience that involves an activity toward a common purpose, creates new identities and shifts social learning to its transformative power, and points to possibilities to intervene and make things better (Ismail, 2006:54). In the informal learning context women learn by reflecting on lived experience and, in these ways, generate new knowledge and understanding that may challenge oppressive relations. The literature suggests that learning, empowerment, and consciousness raising are not linear processes but are dependent on their contexts that are contested concepts. Learning, in this paradigm, is a central element in development and social change.

The complex picture of social, political, economic, and environmental change that emerges from this chapter suggests that social transformation—particularly in gender relations and roles—comes about when people become “co-creators” of knowledge, learning informally with and from their peers, and choosing when and how to engage with new knowledge and skills (Acharya and Robinson-Pant, 2017: 15).

The importance of this review for educators who teach in diverse contexts characterized by differences in race, gender, ethnicity, nationalities, religions, and world views toward democracy and social justice is to be conscious of the histories of their learners, the power dynamic between educator and learner, to work from the personal experience of the participants, allow them to co-design the curriculum and see them as co-producers of knowledge. Educators can take heed from the late bell hooks’ (1994) notion of an engaged pedagogy, based on Freire’s liberatory pedagogy. In summary she urges educators who work in diverse learning spaces to take risks, to share their personal experiences with learners, to help students think critically, to transgress dominant ideologies, to care about each learner, to educate with their hearts and minds and to act against injustices for freedom.

Environmental learning can occur in a myriad of ways and settings. Yet, relatively few scholars and educators have focused on how learning *about* and *for* the environment can be facilitated in informal learning contexts. The notion of environmental citizenship education, similarly, is one that has remained in the margins of the field, in part because of its amorphous, ambiguous, and interdisciplinary nature, and its overlap with other concepts such as ecological citizenship and sustainability citizenship. In this chapter, we start by providing an overview of the concepts of environmental citizenship education and informal education. We then introduce three case studies of informal environmental education in Guatemala, China, and the United States.

Environmental citizenship education

The idea of environmental citizenship is highly contested in part because the very concept of *citizenship* is controversial. As Dobson and Bell (2006, p. 4) have pointed out, there is “no determinate thing called ‘environmental citizenship.’” Even though there has been increasing attention paid to environmental citizenship within the fields of environmental science, social studies, and civic education, there is still significant uncertainty and debate about its core elements. Unsurprisingly, therefore, scholars have adopted different definitions of environmental citizenship. For example, it has been conceptualized as a matter of justice, a commitment to the common good, and a radical challenge to social injustices (Barry, 2006; Dobson, 2007). Others, however, have characterized environment citizenship in terms of environmental rights, relationships, and obligations (Bell, 2004; Warwick, 2012).

Apart from the different scholarly conceptions of environmental citizenship highlighted above, various national and international government and non-governmental organizations have also developed their own definitions. For example, the European Network for Environmental Citizenship (2018: para. 1) characterized education for environmental citizenship as cultivating “a coherent and adequate body of **knowledge** as well as the necessary **skills, values, attitudes and competences** that an environmental citizen should be equipped with in order to be able to act and participate in society as an **agent of change** in the **private and public sphere**, on a **local, national and global scale**, through **individual and collective actions**.” Notably, the organization has also emphasized the importance of considering democratic action, structural causes of environmental issues, as well as inter- and intra-generational justice.

In this section, we focus on three key elements highlighted in the preceding paragraphs: (a) rights and responsibilities of environmental citizenship; (b) public and private environmental citizenship; (c) spatial and temporal dimensions of environmental citizenship.

The rights and responsibilities of environmental citizenship

A liberal understanding of environmental citizenship emphasizes how citizens have substantive and procedural environmental rights such as a right to environmental goods including water and air that meets particular health and legal standards, and a right to participate in developing policies and regulations that establish those standards (Bell, 2005; Schild, 2016). The Aarhus Convention, which entered into force in 2001, is a prominent example of a legally binding international

agreement that has established environmental rights for individuals and groups. The three rights that the Convention provides for include: (a) the right of access to environmental information held by public authorities; (b) the right of the public to participate in making decisions with regard to the environment; and (c) the right to challenge or contest decisions made by public authorities (United Nations Economic Commission for Europe, n.d.). Significantly, this international agreement imposes obligations on governments to be accountable, transparent, and responsive toward the public with regard to environmental issues.

The civic republican conception of environmental citizenship, on the other hand, argues that citizenship is not just about rights and entitlements but also requires a reciprocal commitment to fulfilling obligations and duties (Smith and Pangsapa, 2008). From this perspective, environmental citizenship is thus primarily concerned about “doing, acting, and performing duties and public acts ... for the common/public good” (Barry, 2006: p. 27). This definition offered by Barry highlights several key elements including civic virtues, civic responsibilities and service, and a commitment to the common good. These virtue- and duty-based understandings of environmental citizenship can frequently be found in school curricula and in public statements offered by governments and international organizations. For example, the Government of Canada’s (2012: Citizenship Responsibilities, para. 6) overview of Canadian citizens’ responsibilities states: “Every citizen has a role to play in avoiding waste and pollution while protecting Canada’s natural, cultural and architectural heritage for future generations.” In a similar vein, the European Network for Environmental Citizenship (2018: para. 1) defines environmental citizenship as “the exercise of environmental rights and duties” and these duties include being “agents of change” as well as taking action to solve and prevent environmental problems.

Civic republican and liberal traditions of citizenship have greatly influenced environmental education despite the attempts of some scholars to push back against largely Eurocentric assumptions of such traditions. Scholars in Latin America, for instance, have argued that it is important to go beyond the traditional Western focus on rights and responsibilities to focus on a conception of “citizenship” that is “more integrally ecological” (Latta and Wittman, 2010: p. 113). This alternative conception needs to acknowledge indigenous worldviews, consider different ways of knowing, and recognize the “materiality and subjectivity of nature” (p. 112).

Public and private realms of environmental citizenship

Second, environmental citizenship encompasses *both* the public and private realms. The fluid and multidimensional nature of environmental issues means that the distinction between public citizen and private citizen is blurred. As Dobson and Bell (2006: p. 7) have pointed out, “‘private’ actions can have important public consequences.” For example, an ostensibly private consumer decision like purchasing a car or driving to work (rather than taking public transport) can have public environmental and social consequences such as increased air and noise pollution, and greater fossil fuel consumption. Similarly, other private actions such as deciding whether to install solar panels or home insulation may have significant public consequences in terms of reducing energy use and wastage.

Some scholars have suggested, therefore, that environmental citizenship should address both public and private sphere environmentalism (Stern, 2000). *Public* environmental citizenship activities can incorporate different kinds of environmental activism ranging from low-commitment activities such as lobbying, petitioning, and donating money, to actively participating in environmental organizations and movements. There are also non-activist types of public environmental behaviors and these include articulating support for environmental policies or willingness to pay higher taxes. *Private* sphere environmentalism, on the other hand, is limited to individual behaviors in the private sphere such as recycling and purchasing energy efficient products. The environmental consequence of each of these behaviors is small but when aggregated, these can potentially have a significant impact (Stern et al., 1999).

Most environmental education programs have tended to focus on the private sphere and behavioral modification of individuals (Berkowitz et al., 2005). However, as Chawla and Cushing (2007) and others have argued, the effectiveness of private sphere actions is limited unless it includes collective organizing for changes in the public sphere. This is because collective political engagement can move business and government to remove barriers to action in private life. For instance, consumers cannot opt for public transport if the infrastructure is not made available by businesses and the state. Consequently, the goal for environmental education should not simply be environmental action but should instead be the “most strategic actions” in the public and private spheres (Chawla and Cushing, 2007: p. 438). Therefore, drawing on the work of Bandura (1997), Chawla and Cushing (2007: p. 446) also suggest that education for the environment should not just focus on developing individual competence, but also *collective* competence, defined as “the belief held by members of a group that they can coordinate their actions effectively and accomplish shared goals through unified efforts.” This can include having opportunities to make meaningful and successful contributions to community projects as well as learning how to plan, coordinate, and collaborate with diverse others.

Spatial and temporal dimensions of environmental citizenship

Citizenship is, as Shin and Bednarz (2019: p. 1) remind us, “inherently spatial” and this has been further exacerbated by the increasing ubiquity of geospatial technologies that have changed the nature of our relationships with and understandings of the physical world. In addition, given the increasingly complex and multidimensional nature of environmental issues, it is important

for students to be conscious of the *spatial* dimensions of citizenship (e.g., Cogan and Kubow, 1997; Shin and Bednarz, 2019). While some environmental citizenship education programs explicitly or implicitly assume what Lorimer (2010: p. 313) characterizes as “a commitment to a global spatial imaginary” such as open borders, global networks, and mobility of people and ideas across international borders, other programs are significantly more local and limited in scope.

It is important to consider the spatial dimensions of environmental citizenship programs because research has shown critical spatial thinking and awareness of socio-spatial processes can help students acquire deeper understandings of the impact of historical and present-day boundaries, spatial exclusion, and spatial inequalities (Gordon et al., 2016). In addition, students’ willingness to engage in broader and more global forms of civic action can be shaped by the kinds of knowledge, experiences, and interactions that they have had at different levels. Some studies, for instance, have shown that students who were exposed to a curriculum that focused on personally relevant local problems and issues and how the local government addressed these problems learned more about how social change occurs (Kahne et al., 2006).

Concurrently, students also need to be able to understand the *temporal* dimensions of environmental citizenship, namely how past actions can affect current experiences, and how present-day decisions can have an impact on future generations. Scholars such as Anand and Sen (2000) have, for example, written about the relationship between environmental sustainability and intragenerational/intergenerational justice and equity. They argue:

We cannot abuse and plunder our common stock of natural assets and resources leaving the future generations unable to enjoy the opportunities we take for granted today. We cannot use up, or contaminate, our environment as we wish, violating the rights and the interests of the future generations. That universalism also requires that in our anxiety to protect the future generations, we must not overlook the pressing claims of the less privileged today. A universalist approach cannot ignore the deprived people today in trying to prevent deprivation in the future (p. 2030).

In other words, it is vital for environmental citizenship education to help students understand the necessity of fair and equitable allocation of environmental resources between the present and future generations.

The spatial and temporal dimensions of environmental citizenship thus suggest that it is essential for students to recognize the *interrelated* dimensions of environmental concerns and problems. Collective action problems, for instance, are a useful way of illustrating both the spatial and temporal dimensions of environmental issues and how these dimensions demonstrate the interrelated and interdependent nature of such environmental concerns. According to Ostrom (2010: p. 155), collective action problems are “settings where decisions about costly actions are made independently but outcomes jointly affect everyone involved.” Environmental issues such as the management of fishing resources and extraction of water resources for farming or industrial use are collective action problems that can affect not only the local people living in the vicinity but can also have negative effects on people physically located far away. These collective action problems can also simultaneously affect both this generation and future generations. For example, even though an individual may personally benefit if he/she chose to exceed recommended catch limits for fish or use more water from a river for irrigating his/her crops, if everyone chose to maximize their short-term benefits by taking such actions, the existing and future entire natural world (not just humans) will be worse off.

Informal and non-formal environmental education

While scholars and educators have consistently acknowledged the importance of informal and non-formal learning, much of the attention within education research has been focused on formal learning environments. Scholars such as Scribner and Cole (1973), however, have argued for an increased emphasis on studying learning outside the formal education system because schooling in the industrialized world is mainly focused on didactic and rational approaches to learning whereas the bulk of learning that people go through takes place in everyday situations. Following Scribner and Cole, other scholars have also attempted to document the effectiveness of learning in societies which do not have formalized education structures (e.g., Greenfield and Childs, 1991; Saxe, 1988).

Learning is, as Falk and Dierking (2000: p. 136) point out, a context-based process that requires making explicit connections across time and understanding the intricate relationships among individuals, communities, and the physical environment. They write: “(Learning is) relating past experiences to the present, connecting what is happening in the present to what has happened in the past ... Learning is a dialog between the individual and his or her social/cultural and physical environment.” When applied to environmental education, this implies that both formal and informal kinds of learning are important for helping young people acquire environmental knowledge and providing them with an intellectual foundation for thinking about how humans interact with the environment. In order to support effective environmental education, therefore, the educational infrastructure should include both formal schooling as well as other social and cultural resources that support informal environmental experiences (Falk, 2005; St. John and Perry, 1993).

Informal learning about the environment

While environmental educators, researchers and policy makers have historically focused their attention on formal schooling, there has been a growing appreciation for the role of other non-school based resources for learning (Falk, 2005). These include

physical settings such as museums, nature parks, zoos and aquariums, as well engaging with media like nature documentaries on television, news about the environment in the newspapers, radio, or on the Internet. Additionally, learning may also occur through participation in environmental organizations such as the World Wildlife Fund, nature societies, or outdoor adventure clubs.

The definition of informal learning varies within the literature but in general, researchers have sought to define learning based on the inputs and outcomes of learning, as well as the degree of control the learner has over his/her own learning. Heimlich (1993), drawing on the Lifelong Learning Model developed by Mocker and Spear (1982), has suggested that learning settings can be differentiated based on who controls the objectives and means of learning. *Formal learning* occurs when institutions control both the objectives and means of learning, while *informal learning* involves individual control of the objectives but not necessarily the means of learning. For instance, Falk (2005: p. 272) has argued that many informal learning opportunities involve “carefully crafted pedagogy or andragogy,” and therefore are not completely without institutional facilitated “instruction.”

Heimlich (1993) has also proposed the category of *self-directed learning*, where individuals control both the objectives and means of learning. Similarly, Falk and Dierking (2000) have defined such individual control over learning as *free-choice learning*. Free-choice learning, they argue, emphasizes the underlying motivation and interest of the learner (rather than the objectives of the institution in which the informal learning takes place), and can occur in any sequence, at any time, and with complete learner volition. Therefore free-choice learning in environmental education leverages on the learner’s interest in the topic or setting, and allows the learner to select from a range of learning options. For example, Riemer et al. (2014) have proposed a model that allows participants the means to define the context of their participation and enact meaningful change in their own lives and/or the lives of their community.

Evaluating the efficacy of informal environmental education

Scholars have found that encountering nature in an informal setting often leads to greater environmental understandings and an increase in the adoption of environmentally sustainable practices. Numerous studies, for example, have noted the link between outdoor experiences and improvements in environmental knowledge (Hart, 1979; Lisowski and Disinger, 1991; Moore, 1986; Sobel, 1993). Other scholars such as Ballantyne and Packer (2005) have also observed how informal learning can impact the emotional engagement of learners. Unlike formal schooling, informal learning involves participants in meaning-making which occurs in context (Nunes, 2010) and thus learning about the environment will be imbued with “situation-specific meaning” (Falk and Dierking, 2000: p. 461). In addition, informal learning experiences can also contribute to children’s feelings of connection with nature, develop their knowledge and values related to the protection of nature (Palmberg and Kuru, 2000), and provide learners with positive experiences of how to apply the knowledge they learn to their own lives (Alsop and Watts, 1997; Ballantyne et al., 2001).

An additional advantage of informal learning is that it extends a society’s learning infrastructure for environmental education. For instance, informal learning can potentially help mitigate the limitations of the physical classroom (Schwarz and Stolow, 2006) or shortages in budgets for the provision of learning resources in schools. The kinds of learning experiences offered in informal settings are also potentially more diverse and provide spaces in which “the very different and competing discourses of the school system and the everyday world are reconciled” (Stockmayer et al., 2010: p. 26). Arguably, therefore, informal learning in environmental education has the potential to allow learners who have poor access to formal education resources to develop the knowledge, skills, and dispositions for transformational environmental action.

Case studies of informal environmental citizenship education

In this section, we highlight and analyze three diverse case studies of informal environmental citizenship education located in different national and cultural contexts—Guatemala, China, and the United States.

Case study 1—Women in Agroecology Leadership for Conservation, Guatemala

The first case study highlights an example of *formal learning* in an informal environmental citizenship education program. This case illustrates how the institution—the US-based Community Cloud Forest Conservation organization—determines both the objectives and means of learning for the participants. The Women in Agroecology Leadership for Conservation (WALC) program is a multi-dimensional 25-day environmental education and leadership program for young unmarried indigenous Q’eqchi’ Maya women aged 12–28 years living in the central highlands of Guatemala. The program has three requirements for the participants: (a) Complete the 25-day program; (b) Continue their formal education in schools; (c) Establish a small agroforest parcel of 16 trees as well as heirloom and traditional crops (Community Cloud Forest Conservation, n.d.). Upon completion of the program, the participants are awarded scholarships of approximately US\$135 for use toward school fees, books, and other expenses (Bowen and Miller, 2018). The curriculum, lessons and small group activities, conducted in the local language, are mostly led by peer leaders or staff members who were previously participants of the program.

The program appears to prioritize private sphere environmentalism by focusing on developing the participants’ individual capacities and understandings, although there is some attention paid to how these participants can become community leaders.

The program is principally centered on women's rights and empowerment, environmental conservation, as well as economic security. For example, the participants study a range of interrelated topics such as conservation, agroecology, sustainability, nutrition, and health, and they are taught about traditional Q'eqchi' crops, traditional medicinal plants, and reforestation strategies. In order to enhance their economic contributions to their families, students are taught practical skills such as candle-making and the production of dried fruit and jam for sale or for future home consumption (Bowen and Miller, 2018).

This program also focuses on the responsibilities of the environmental citizen, in particular, how the participants can contribute to ensuring the health and well-being of the cloud forest ecosystem. The interactive lessons held at the NGO's agroecology center include sustainable farming strategies such as the use and production of organic fertilizer, planting and grafting fruit trees, and managing vegetable gardens and tree nurseries (Bowen and Miller, 2018). Notably, in order to address the problem of deforestation, the program also emphasizes environmental stewardship and conservation biology classes that teach the participants about protecting local ecosystems and respecting wildlife (Briggs et al., 2019). These new skills and understandings are collectively designed to help the participants confront some of the socio-economic and ecological challenges that they face in their daily lives including gender prejudice and loss of biodiversity due to deforestation.

Case study 2: Roots and Shoots, China

Roots & Shoots (R&S) was established in Tanzania by Jane Goodall, the United Nations Messenger for Peace and renowned chimpanzee researcher, as an environmental and humanitarian program that empowers youth to participate in sustainable development. It operates in almost 100 countries, championing the development of ethical and sustainable environmental values and behaviors through community service programs. R&S is a good example of *informal learning* as it allows youths to be engaged in the community and develop projects that are relevant to their communities. While projects are identified and developed by youths, they nevertheless operate within an institutionally structured 4-step framework: (a) Understand one's own strengths and weaknesses; (b) Observe the community to identify areas of need; (c) Plan a service-learning campaign to address the need; and (d) Reflect on the impact of the campaign (Roots and Shoots, 2018). At the same time, program officers provide input on the feasibility of the proposals and guidance during the execution of the projects. This recalls Falk's (2005) assertion that informal learning activities may provide individuals with freedom insofar as objectives of learning are concerned, while crafting the means of learning.

Johnson et al. (2007) studied R&S clubs operating in schools in Shanghai, Beijing, and Wenzhou, China, and noted that youths had opportunities to participate in learning opportunities beyond the formal school curriculum. For instance, they went on field-trips to natural environments and attended art exhibitions which sought to raise environmental awareness. These students conducted research in collaboration with local communities to raise awareness of, and/or provide solutions to environmental issues. Similar to other R&S programs, these R&S clubs in China are premised on inculcating civic responsibility and working toward the common good. In fact, the authors found in their study that the impact was greatest in the domains of civic and social responsibility, as self-reported by youths and observed by their program coordinators. R&S also provided the social infrastructure to extend participants' personal environmental interests into the public sphere. For instance, respondents were highly motivated by the opportunity to establish and maintain contact with like-minded peers, and valued the connections they made with the local community. Moreover, while most of their actions were focused locally, R&S provided links to partner clubs in other parts of China, as well as the world.

Interestingly, the weakest benefits from the program was in the area of knowledge gains, particularly global environmental knowledge. This is unsurprising given the locally oriented nature of the R&S projects. Building on Schwarz and Stollow's (2006) assertion that informal learning can overcome the shortcomings of formal education, we argue that formal schooling can also buttress environmental citizenship education by helping students connect their experiential learning in the here and now to larger environmental issues at the international scale, and to understand the human-environmental interactions across time.

Case study 3: the Wabanaki Youth Science (WaYS) program, United States

The Wabanaki Youth Science (WaYS) program is another example of *formal learning* in an informal environmental citizenship education program. A collaboration between the University of Maine and the Native American Maine Wabanaki community, the program seeks to help young Wabanaki students (grades 6–12) to become future environmental leaders for their communities. The WaYS model is unique in its explicit attempt to fuse Western science knowledge with Traditional Ecological Knowledge (TEK) in order to meet the cultural needs of the students and their communities (Carr and Ranco, 2017).

The WaYS program includes three components: (a) Week-long summer earth camps and weekend mini camps; (b) TEK programs at teen centers; and (c) short- and long-term student internships (Carr et al., 2017). These three components, taught by university faculty, tribal cultural knowledge keepers, and other environmental leaders, are designed to provide the youth with opportunities to engage with the program over several years, and possibly even at the university level. Even though the WaYS program is fairly structured, the Native youth also have an opportunity to make decisions about the kinds of environmental issues that they are interested in and also identify additional programming that meets their needs. For example, the mini camp idea was initiated by the youth who wanted to be engaged year-round in activities (e.g., foraging, fire-building, and shelter-building), and not just the summer months (Carr et al., 2017).

The WaYS program incorporates both the private and public elements of environmental citizenship because it does not just focus on equipping individual students with environmental knowledge and skills, but also explicitly addresses the broader environmental

needs of the tribal communities. During the summer earth camp, for example, students are taught topics such as basket weaving, medicinal plants, tidal ecology, and the impact of climate change on fish habitats, while also working with tribal elders and natural resource experts on environmental issues that are particularly relevant to the tribal community (Carr et al., 2017; University of Maine, 2015). Importantly, the spatial and temporal dimensions of citizenship are also particularly prominent in this program with its emphasis on the traditional cultural heritage of the students, the teaching of cultural science, and the place-based nature of the learning.

Collectively, these three cases illustrate the different dimensions of environmental citizenship education and informal education—the rights and responsibilities of environmental citizenship, the public and private dimensions of environmental citizenship, and the spatial and temporal dimensions of environmental citizenship. Finally, these three case studies of environmental learning featuring indigenous youth and participants in non-Western settings also highlight the increasing need for scholars and educators to look beyond current dominant conceptions of environmental citizenship to incorporate unique and traditional ways of knowing and doing that are more culturally relevant.

Conclusion

The knowledge, competences, and attitudes necessary for individuals and communities to advocate for the environment at various scales is key to the development of just and equitable societies. While the focus of much educative effort remains on schools and formal education, we have highlighted how informal environmental education can extend the educational resources of a community beyond the formal school curriculum in transformative ways. Moreover, such community-based environmental education encourages learners to identify and act on issues that are culturally and contextually meaningful to their communities. The case studies highlighted in this chapter suggest how informal environmental education can strengthen learners' understandings of individuals' rights and responsibilities toward society, foster procedural knowledge of how to organize and work collectively toward a common goal, and/or connect local perspectives to broader environmental issues across space and time.

Glossary

Youth Individuals who are approximately age twenty-five or younger

Technology Tools or devices used to communicate and create that require knowledge and skill for application, yet are always tied to social relations and institutions

Media Any tool or medium used for broad communication purposes

Social Movement Actions taken for justice to form a collective and coalitions for social, political, or economic change through strategizing and direct actions

Justice Equitable access to opportunities and resources for living a healthy, joyful, and peaceful life for all species

Educators Those of all species who humbly share their knowledge

Learning Receiving and accumulating knowledge that is shared or learned through experience

Introduction

As early as 1932, Vygotsky “identified the immense value of everyday, informal learning for young children” (Hedges, 2021, 1). Yet as Cohen noted in 2007, “The educational activities and settings defined as ‘informal’ or ‘non-formal’ are extremely diverse ... [and] The seemingly impossibility of isolating traits clearly distinguishing informal from formal education have fueled an ongoing debate” (p. 1). According to Rogoff et al. (2016), it is unfortunate that most of the attempts at defining or describing “informal learning” actually involve identifying how it is not “formal learning.” There are also descriptions and definitions of “informal,” “non-formal,” and “formal” learning within the thousands of available articles and books focusing on these topics that might be considered similar or contradictory at times (Cohen, 2007).

In 1982, La Belle called for an approach that examines formal and informal learning through a less distinct lens, arguing “that educational resources must be viewed as interacting modes of emphasis rather than as discrete entities” (p. 159). Additionally, La Belle asserts that various forms of “education may exist simultaneously, sometimes in concert with one another and sometimes in conflict” (1982, 162). Indeed, a 2012 article by Cartwright is titled “Informal education in compulsory schooling in the UK,” offering an example of exactly what La Belle asserted and exemplifying how “the two are constantly intermingled” and “how they are constantly interacting in the classroom” (Scribner and Cole, 1973, 553; 558). Furthermore, Callanan et al. note that a formal-informal dichotomy is too simplistic, and the authors highlight other theoretical and empirical works that make similar claims (2011). Thus, informal learning presents itself as an elusive, relational, contextual, and malleable concept.

In this entry, we use explorations of scholarly literature and online archives to situate youth alongside technologies and communication mediums as innovators and educators for social and political change. We begin by offering suggested criteria from the literature across disciplines and fields for distinguishing between what is labeled as *informal* versus *formal* learning or education and with this initial acknowledgment that the two concepts continuously commingle (Scribner and Cole, 1973). Next, we offer a brief genealogy of the fears often associated with new technologies and their potential to provide what adults often categorize as undesirable informal learning opportunities for children and youth. Then, we provide examples of young people as educators strategically utilizing available technologies to educate others, motivate direct actions, and build memberships and coalitions for justice. Finally, we suggest the need for expanded discussions concerning the purpose of learning or education in society and other notions for contemplation.

Throughout the remainder of this entry, we choose to engage with the words “informal learning” rather than “informal education” because the former indicates an action or a doing rather than the representation of an institution or system which might be more commonly associated with the noun “education.” Additionally, when referring to “youth” we consider recent research which has found that adult and teen brains work differently. Thus, “youth” or “young people” in this paper is referring to anyone who is approximately 25 years-old or younger in alignment with studies from neuroscientists who have found that “The rational part of a teen’s brain isn’t fully developed and won’t be until age 25 or so” (Campellone and Turley, n.d.). This word-choice determination was made alongside the understanding that “Childhood and youth are complex terms: socially constructed, historically contingent and variously located (Holloway and Valentine, 2000)” (Mills and Kraftl, 2014, 2). We are conceiving of the word “technology” as consistent with Raymond Williams’s view:

A technology ... is, first, the body of knowledge appropriate to the development of such skills and applications and, second, a body of knowledge and conditions for the practical use and application of a range of devices ... What matters in each stage, is that a technology is always, in a full sense, social. It is necessarily in complex and variable connection with other social relations and institutions ... (1981/1989, 173).

What is informal learning?

The difficulty of distinguishing between various types of learning is partially because “learning has been conceptualized quite differently by behaviorist, cognitive, developmental, and educational theorists” (Callanan et al., 2011, 646). However, scholars have long recognized that learning is embedded in social and cultural contexts and that people spend most of their time learning outside of school environments. In 1934, Thrasher wrote that most of what young people learn is not “acquired through the formal processes of education as exemplified in schools and other educational agencies” (p. 471). Rather, Thrasher contends that the majority of educational processes youth encounter “are the result of the universal process of social interaction” (1934, 471). This section investigates and organizes some of the themes and criteria present when scholars are defining and describing informal learning.

In 1950, Parker stated that “one’s informal education commences practically at birth ... with such rapidity [of development] that by the time [they] first reach what we think of as school-age, [they] already, thru wholly informal education, are a relatively accomplished young citizen” (p. 90). As an experienced educator in the Laboratory Schools at the University of Chicago, Parker would likely have observed many of the influences that accompany students learning yet exist outside of schools. Thus, researchers and educators have long recognized what was quantified at the National Science Foundation’s Center for Learning in Informal and Formal Environments in 2005: 81% of learning opportunities for children are provided outside of school settings (Rogoff et al., 2016).

Although there is not a standard definition of informal learning accepted and utilized across all areas of scholarship and approaches, most definitions offer similar characteristics. Often, informal learning is described as part of everyday activities in which people engage (Geerds et al., 2015). Coombs and Ahmed offer the following definition of informal education: “informal education is ‘the lifelong process by which every person acquires and accumulates knowledge, skills, attitudes and insights from daily experiences and exposure to the environment’” (Coombs and Ahmed, 1974, 161). In a review of the book, *Using informal education: An alternative to casework, teaching and control* (1990), Rogers presents some key characteristics of informal learning which are presented in the book he is reviewing. These include “the everyday life experience of the participants, not a set and codified curriculum” (Rogers, 1991, 105). Livingston also emphasizes the lack of mandated curriculum as a characteristic of informal learning stating, “Informal learning is any activity involving the pursuit of understanding, knowledge, or skill that occurs without the presence of externally imposed curricular criteria” (Livingstone, 2006, 206).

In addition to informal learning being flexible and having the process and content controlled by the learner, some argue that it occurs in an informal setting such as a space not specifically designed for schooling (Rogers, 1991). Informal learning practices occur “in the everyday spaces of human activity ... which lie outside the institution of schools and other formal learning sites” (Kauko and Wilkinson, 2018, 1176). Erstad recommends research approaches to learning that examine the inter-relationship between home, school, and community because “it offers a way of bridging the binary opposition between formal and informal learning” (2012, 30). However, Rogoff et al. contend that they believe “how learning is organized and supported is more important than where learning occurs” (2016, 357–358). Furthermore, Livingston argues that informal learning can be done anytime, anywhere, and with anyone (2006, 217). Although defining informal learning appears to be challenging and at times perhaps contentious, it seems “clear that informal learning occurs in many varieties across multiple communities of practice” (Callanan et al., 2011 646).

Drawing from a review of literature on informal learning, Callanan et al. present five dimensions that they associate with informal learning. These dimensions of informal learning include that it is non-didactic, highly socially collaborative, embedded in meaningful activity, initiated by learner’s interest or choice, and removed from external assessment (Callanan et al., 2011). Foley also emphasizes the social aspect of informal learning, describing it as people teaching and learning from each other “naturally and socially in workplaces, families, community organizations, and social action” (1999, 7).

According to Vizcaino-Verdu et al. cyberspace, digital capabilities, and virtual opportunities have created additional social spaces for informal learning and collective pedagogies with “a countless number of communities based on unlimited types of interests in which infinite forms of social relations develop” (Bautista-Sancho, 2012; 124)” (Vizcaino-Verdu et al., 2019, 94). Exploring queer identity through informal teaching and learning in online LGBTQ communities, Fox and Ralston assert that there is much informal

learning that occurs as users “seek out and establish connections with others via common nodes or common interests” (2016, 636). Thus, many of the informal learning dimensions identified by Callanan et al. appear across the literature with a particular emphasis on social interactions even as ways to develop communities and social interactions evolve over time alongside forms of communication and technologies.

A brief genealogy of informal education concerns and technology

As many scholars have noted, “For millennia, children have learned the skills, life ways, and philosophies of their communities informally, through their engagement in everyday family and community settings” (Rogoff et al., 2016, 362). However, studies of informal education in academia in the United States are a more recent phenomenon. Although the study of informal learning began during the same period as the origin of the American Educational Research Association, it was not until the 1920s that descriptions of how and why children were informally learning began to appear in anthropological publications. Shortly after in the 1930s, connections between anthropology and psychiatry developed (Rogoff et al., 2016) which seemingly increased interest in informal learning across disciplines. The multiple areas of study represented in the citations of this writing illustrate the trans-disciplinary and expansive interest in informal learning.

Many recent popular debates across disciplines center on young people’s online activities and focus on possibilities of harmful informal learning or negative activities. Alternatively, alarms about the harmful potentials within informal learning “have been criticized by some as being overly deterministic, as positioning young people as passive and ignoring the complexity of children’s and young people’s consumption of media” (Willet, 2008, 49). History can also demonstrate that student engagement with technologies and communication and student-led media can provide a platform for youth to educate others, “express their opinions, control their messages, and facilitate political participation” (Salamon, 2018, 4). This section reviews some of the technological advances that have ignited interest and concern among adults because of the technological capacities they create for informal learning opportunities among youth.

There is an interesting chronology of articles studying technological advances and mass media and their potential influence on the informal education of young people. Particularly, concerns continue to be raised that young people do “not yet possess fully the capacity for ‘adult discount,’ [and] do not yet have the background by which to discredit sufficiently” (Cressey, 1934, 506) those representations of life that technologies and mass media produce. For generations adults “have worried about whether exposure to ‘new’ forms of media, including the radio (Heisler, 1948; Longstaff, 1936), comic books (Thrasher, 1934), television (Maccoby, 1951), video games (Egli and Meyers, 1984), and violent media (Anderson et al., 2010; Ferguson and Kilburn, 2010), is ‘harming our children’” (George and Odgers, 2015, 832).

Funk (1998) argues that with the proliferation of radios in people’s homes in the 1920s and 1930s, “mass communication became mass education” (p. 43). The author also notes that “the history of the rapid expansion of the radio industry bears an uncanny resemblance to the all-consuming expansion of computing [and] telecommunications” (Funk, 1998, 31) in the late 20th and early 21st centuries. Along with adjusting to new technologies and forms of communication, the informal educational opportunities that might be available to young people through new technologies are often a source of discomfort for adults. Funk claims “In families where public information was usually screened by the parents and others in charge of moral conduct, many feared losses of control over the information their families heard from such an easily accessible source—the radio” (1998, 42). The author also describes a reciprocal relationship between what was learned in formal and informal education spaces and claims that speculating about the effects of one is not possible without including the other (Funk, 1998, 2016). Of course, as recording technologies improved and radios became more standard in automobiles, mostly white adults raised racialized concerns about the informal learning effects of exposing white youth to musical styles previously unknown to them (Clayton, 2016).

In 1934, Cressey expressed his concern that “The great frequency of cinema attendance by children and young people is not without its important educational effect ... [because] the motion-picture industry dispenses a great deal of informal education” (p. 505). Reflective of more contemporary criteria for identifying informal learning, Cressey notes that “In contrast to the traditional school, where motivation in learning arises extraneously, primarily through the teacher’s special efforts and skill, the cinema provides for many children a means, vicariously at least, by which learning may really be a natural result of interest and activity” (1934, 509). Preceding now commonly recognized socio-cultural traditions of study that emphasize context, Cressey avoids generalizing or promoting panic with regard to motion pictures explaining that “The full significance of the cinema, however, cannot be seen except by reference to the specific social backgrounds of each individual ... in terms of his own cultural heritages, his own dominant interests and values, and his own *axeological world* can we begin to see adequately what any photoplay may mean for a spectator” (1934, 11).

With the invasion of televisions into homes after World War II, concerns again arose but this time mostly regarding the effects that viewing violent television shows might have on children. Again, researchers attempted to assuage concerned adults explaining that “opinions as to the consequences [of televised portrayals of violence] are mostly based on unsound assumptions and glaring gaps in the variables considered. Perhaps the most serious of these gaps is the omission of the wider social context in which viewing takes place” (Edgar and Edgar, 1972, 602). Although many studies can show an influence of television on children, the authors argue that “not enough is known about the mechanisms involved” (Edgar and Edgar, 1972, 610) and they urge researchers to maintain an approach that incorporates “the total socialization context” (Edgar and Edgar, 1972). Alarm-raising about the effects of children and adolescents viewing violent television was only amplified when video-game playing became prominent among youth. Yet,

"Despite decades of research on the effects of violent video games on behavior the implications for the 'real-world' effects of violent video games remain highly contested" (Coyne and Stockdale, 2021, 11).

Unsurprisingly, the accessibility of information through the internet and the extensive use by youth of portable devices connected to the internet (George and Odgers, 2015) offers a seemingly infinite number of informal learning and teaching opportunities that have also given rise to concerns about young people's development. After interviewing 141 parents of young people, George and Odgers found that parents expressed certain common concerns regarding the influence of mobile technologies: "adolescents' safety (cyberbullying and online solicitation), social development (peer relationships, parent-child relationships, and identity development), cognitive performance, and sleep" (2015, 831). Even among the uninterrupted fearfulness about the influence of the latest media and technologies upon youth that has spanned generations, "few uniformly negative effects of new technologies on adolescent development have been documented. With some notable exceptions, many of the effects of new technologies on adolescents' lives have been, or are expected to be, positive" (George and Odgers, 2015, 848). Cruz's (2015) work with homeless LGBTQ youth and technology use found that SmartPhones facilitate social networks and the connections to street economies of exchange and bartering. Informal learning about social service networks, surveillance by police, and other necessities like food, shelter, and safer space are shared among communities of street youth through apps and other digital platforms. Generally, those studying the effects of the latest media and technologies emphasize that there are a multitude of factors outside of the technology that need to be considered before concluding whether young people are susceptible to harm from the informal learning and teaching opportunities the new technologies or media present (Boyd, 2014; Calvert et al., 2002; George and Odgers, 2015).

Youth as perpetual educators

Merely asserting that youth or children are naturally informal educators is perhaps stating the obvious, and there are blurred boundaries between formal and informal teaching as well as learning. For example, older siblings may engage in educational care-work as part of their "sibcare" obligations which likely places demands on older siblings to engage with informal and formal (school-related) teaching practices. This is particularly true if schools close because of a pandemic and subsequently implement synchronous distance learning during the school day while some parents are away from homes because they cannot work remotely. "Sibcare" is defined as "activities ranging from complete and independent full-time care of a child by an older child ... as well as simply 'keeping an eye out' for siblings" (Weisner and Gallimore, 1977, 169).

Often, educational caretaking (as a part of sibcare duties) is a transformative act that supports the family's future mobility (Lambek, 2011, 3). The pandemic that caused widespread school closures in 2020 and caused most schools to resort to forms of virtual remote learning likely increased the demand for siblings to do the educational caretaking in some families, especially in those that are under-resourced and/or in families where parents or guardians could not work remotely during school hours (Kirsch, 2020). Thus, this contextualization of sibcare illustrates both the commingling of informal and formal, portrays youth as educators, and includes a connection to the use of technology. This section continues with moments gathered from literature and online archives that illustrate how and when technologies and advances in communication have placed youth in positions as educators.

In this section, we are going to explore the use of technology by young people as a means or mode for informal teaching and learning with a particular focus on how technology has been used as a tool by youth to educate others during movements for social and political change. According to Buckingham, there is a long tradition in Cultural Studies of "empirical research on youth culture, dating back to the early 1970s, and it is mostly concerned with the ways in which young people appropriate cultural commodities and use them for their own devices" (2008, 4). Looking at young people is particularly useful because

communication between peers naturally increases in terms of both frequency and intensity during adolescence (Larson and Richards, 1989; Raffaelli and Duckett, 1989). Friendships and communication with peers are viewed as critical venues for the development of life-long social and relationship skills (for more discussion see for example Hartup, 1996; Hartup and Stevens, 1997; or Newcomb and Bagwell, 1995) and mobile technologies facilitate constant connectivity with peers and provide new tools for communication and informal learning.

George and Odgers (2015, 834).

Salamon notes that "Although students used media for activism in the 1960s, students now have more tools to quickly spread their messages widely and, in doing so, shape national conversations" (2018, 5). Additionally, Buckingham discusses how technology may be utilized as

... a force of liberation for young people—a means for them to reach past the constraining influence of their elders, and to create new, autonomous forms of communication and community. Far from corrupting the young, technology is seen to be creating a generation that is more open, more democratic, more creative, and more innovative than their parents' generation (2008, 13).

According to Mitra (2000, 2005; Mitra and Rana, 2001), minimally invasive education projects demonstrate that when youth are curious or motivated by something then informal learning will occur through self-instruction and peer-shared knowledge. Thus, amidst all of the adults' fears that accompany not knowing what new technologies and media might bring are also examples of

young people teaching and learning in innovative ways and examples of youth using technology to communicate on behalf of social and political change.

Youth, media, technology, and social movements

The Children's Crusade in May of 1963 in Birmingham, Alabama is (hopefully) a well-known example of how a local radio station was used for desegregation efforts when "black teenagers tuned into their favorite deejays [like 'Tall Paul' White] to hear coded messages telling them where and when to gather" (Boyle, 2005, 251) as they organized to protest Birmingham's violent discrimination and segregation. According to the Civil Rights Movement Archive, "A passion for freedom sweeps through Parker High [School] and the other Black schools of Birmingham and Bessemer, an emotional firestorm ignited by SCLC's young field workers, led by class presidents and prom queens, cheerleaders, and football players" (The Civil Rights Movement Archive, n.d.). Massive numbers of children (those under age eighteen and as young as seven) participated in acts of protest that made significant contributions to the eventual passage of the 1964 Civil Rights Act and radio was a significant instrument during their organizing.

A genealogy of struggles for equitable access to various forms of media or technology for formal and informal learning is also present among young people's social movements for justice. Buckingham cautions that "we should also not forget that access to these media—and the ways in which they are used—is partly dependent upon differences to do with factors such as social class, gender, and [race]" (2008, 5). The courage of the children in Birmingham during the civil rights movement educated and inspired direct action and protests in communities throughout the United States. In the couple of months following the children's actions in Birmingham, statisticians counted 758 protests in 186 cities (Birmingham The Children's Crusade, 1963). A perhaps less well-known story of resistance inspired by the Birmingham children is the bravery of the "Leesburg Stockade Girls." In Americus, Georgia, in July of 1963, fifteen girls ages 12–15 were viciously attacked by police and jailed for challenging segregation laws when they attempted to purchase movie tickets at the front entrance rather than in a back alley of the Martin Theater on Forsyth Street (Salahu-Din, 2019).

For forty-five days the girls were held twenty miles away from their families in a remote area of the woods in a Civil War era structure: the Leesburg Stockade. The authorities refused to disclose the girls' location to their families but a 21-year-old photographer for the Student Non-violent Coordinating Committee (SNCC), Danny Lyon, secretly found the girls, photographed them, and had the photos published in SNCC's newspaper, *The Student Voice*. The story along with the pictures the young photographer took spread, educated, and garnered national attention. The girls were finally released the same week as the bombing of the Sixteenth Street Baptist Church in Birmingham that killed four little girls who were in the basement of the church during Sunday morning services (Salahu-Din, 2019).

Although major media outlets had initially ignored what was happening in Birmingham until the children started their crusade in May of 1963, their courage led to almost 200 reporters covering events in the city. Images from Birmingham were broadcast nationally and globally via newspapers and televisions and inspired young people like the "Leesburg Stockade Girls." The horrific scenes of children in the supposed "land of the free" being attacked by police and police dogs as well as fire hoses also provoked disgust and condemnation of the United States from around the world. According to the online Civil Rights Movement Archives, "the disciplined courage of the protesters was itself a key component of the Movement's message" (n.d., n.p). Along a spectrum of informal and formal learning, through the media, and with available technologies and media communication to share their message, the youth created and spurred a movement that would educate others globally and compel United States officials to eventually respond to injustices (Civil Rights Movement Archives, Birmingham: The Children's Crusade, 1963).

Student journalists like those creating SNCC's newspaper, *The Student Voice*, use media as a key tool for informal teaching and learning, especially when mainstream media ignores students' actions and demands (Armstrong, 2018). According to Armstrong, student newspapers on college campuses "provide information about the world; fill the needs of the students; represent the college or university to the rest of the country; and act as an agent for change" (2018, 2). When students at Howard University in Washington, D.C. in 1968 demanded that the administration make the curriculum more relevant and asked for the inclusion of more student input concerning campus activities, it was the student newspaper, *The Hilltop*, that provided reporting on the protests that occurred until the administrative officials at Howard met some of the students' demands. One of the lead organizers, Adrienne Manns, was also the editor-in-chief of *The Hilltop*. Salamon (2018) explains that "Manns demonstrated that student journalists could draw on their experiences as activists, using media to tell alternative narratives, build public support and create change" (p. 3).

In more recent decades, mobile devices, computers, and the Internet have decreased barriers to communicating and organizing that young people may have encountered prior to the existence of this technology. According to Theocharis et al. "The internet transformed political action and long-established mechanisms of social movement organization, communication, and mobilization in various ways" (2015, 204). The latest technologies and communication forms "connect [young] people according to their interests and enable them to engage in all kinds of collective action, including learning. Schools no longer have the sole monopoly on learning most things" (Rhinegold, 2020, xv). These new modes and means for informal learning and rapid communication transform potential political and civic engagement for youth by providing convenient educational and mobilization tools. For example, research has shown that content circulation via Twitter related to Occupy Wall Street in 2011 was a highly significant informal learning medium for information distribution that enabled the widespread creation and mobilization of counterpublics (Penney and Dadas, 2014; Birmingham The Children's Crusade, 1963).

Since the late 1990s, the Internet has been considered as having the potential for “reinvigorat[ing] youth participation by creating new opportunities for engagement and allowing established forms of offline participation to be carried out with substantially lower costs (Bimber et al., 2012; Earl and Kimport, 2011)” (Theocharis and Quintelier, 2016, 820). In recent decades, social media has frequently been utilized for collective action. There is a significant amount of research exploring how social media use can mobilize activism although it is not always focused on youth as organizers and educators (Wilkins et al., 2019). Movements such as #BlackLivesMatter, the DREAMer movement, Occupy Wall Street, The People’s Climate March, March for Our Lives, the Arab Spring, and others illustrate how informal learning and teaching using digital tools, and internet-worked engagement and civic participation are contributing to the ways young people organize for social change in the 21st century.

For example, Beltrán (2021) investigates “how young immigration reform activists, ‘DREAMERS,’ have brought new, social-media-powered strategies to the fore and, in important ways, have displaced older models of political participation” (p. 50). Another example involves digital video production through a social justice framework. Researchers working with youth who were tasked with creating the videos describe this approach as “intentional, informal learning” (Goldman et al., 2008, 201). According to the authors of this video production study, the youth used technologies to communicate their social message, and “The collaborative video production was a medium through which young people developed ‘critical literacy’ and recognized their potentials for leadership, for peer-to peer-mentorship, and for social change” (Goldman et al., 2008, 202).

Spanning two continents, Tom examines “how youth from specific communities access knowledge which is denied to them in schools, give revolutionary voice to their realities, and broadcast perspectives on race, place and belonging” through the production of hip-hop which “becomes a medium to create alternative educational projects” (2016, 711). Again, the medium is the message and “Hip-hop occupies a space where educators/producers of rap and their students [consumers] can reclaim themselves and their communities from colonial meta-narratives of knowledge” (Tom, 2016, 730). The author of this study explains that the motivation to study youth as informal educators was partially inspired by Michael Apple’s observations that “schools preserve inequalities by affirming the cultural legitimacy of a particular knowledge (i.e., colonial knowledge) as legitimate at the level of curriculum, pedagogy and forms of classroom evaluation which may disqualify or marginalize other communities’ knowledges, histories, languages and cultures” (Tom, 2016, 712). Thus, hip-hop productions, performances, and the digital dissemination of the music by the youth Tom studied is an informal and alternative educational project with young people serving as educators while creating and leading.

#Hashtag

In more distant decades of the past, young people like those currently utilizing or directing the discourse on social media to educate others “might not have had the opportunity to participate in the public sphere” (Carney, 2016, 195–196) so widely. One strategy youth employ to garner attention and a following on social media is the use of hashtags (a word or phrase preceded by the pound # symbol). A hashtag on social media also “serves as an indication (for users and algorithms) that a piece of content relates to a specific topic or belongs to a category” (Olafson, 2021, n.p.), and attaching hashtags to social media posts indicates that a user is openly engaging in conversations associated with them. Hashtags are an informal method of trying to grow conversation and education around a topic and some young people deliberately use hashtags to promote information with social justice aims, to spread their messages, and to solicit new followers on social media (Anderson, 2016).

In response to the acquittal of Trayvon Martin’s murderer in 2013, and to uplift the voices of those often suppressed or missing in social movements (including black women, LGBTQ+, transgender, disabled, and undocumented Black peoples), the Black Lives Matter (BLM) movement was developed (Cox, 2017) and became widely recognized because of the hashtag “#BlackLivesMatter” on social media (Mundt et al., 2018). Between its initial appearance in July of 2013 and through the month of March in 2016, “the hashtag #BlackLivesMatter appeared on Twitter almost 11.8 million times” (Anderson, 2016, n.p.). On Twitter’s 10-year anniversary, the site published a list of the most used hashtags related to social causes with #Ferguson being the most used social-issue hashtag and #BlackLivesMatter being third (Anderson, 2016). Through an analysis of tweets in the early stages of the BLM movement, Wilkins et al. found that “social media can fulfill rhetorical functions for social movements in terms of dening the scope and agenda of the movement; for example, the issues with which the movement is concerned, who is or is not part of the movement, and the specific outgroups whose behavior the movement seeks to change” (Wilkins et al., 2019, 787).

BLM addresses many social justice concerns including women having control over their bodies, fighting against the Dakota Access Pipeline, for people who are undocumented and transgender equality, and stopping violence against Black, Indigenous, and additional People of Color (BIPOC) (Cox, 2017; Carney, 2016). On its website, Black Lives Matter describes itself as a movement to fight for freedom, liberation, justice, and the eradication of white supremacy. Scholarly analyses of BLM’s strategies and mission illustrate how social media as a platform provides “for continued involvement and reflection around issues related to race and policing and highlight[s] its significance for developing common understandings of ideology and a shared sense of movement identity” (Mundt et al., 2018, 2).

Social media allows users to actively engage and shape discussions, which also offers youth an opportunity to contest dominant ideologies and educate. Yet, as others have recognized, often students motivated to educate others on behalf of social justice concerns are “no more passionate than the young people of, say, the Black Lives Matter movement, [yet] it [becomes] clear that the political establishment [is] going to receive them a different way” (Witt, 2018b, n.p.). While social media sites might “serve as platforms for building collective identity and creating a cohesive movement ideology that might mobilize new participants or facilitate coalition-building” (Mundt et al., 2018, 3), scholars also note that there are possible limitations resulting from platform constraints or broader social, economic, and cultural factors (Freelon et al., 2016; Hintz, 2016; Poell, 2014; Tufekci, 2018; Youmans and York, 2012).

Another movement that developed and expanded using a hashtag involves a group of students who survived a 2018 mass shooting at Marjorie Stoneman Douglas High School (MSDHS) in Parkland, Florida. The students organized through their trauma and grief via the internet with the hashtags #MarchforourLives and #NeverAgain. Bent argues that “From their intentional disruption of thoughts and prayers rhetoric to their organized political action, March for Our Lives (MFOL) student-activists cut through business-as-usual politics” (2019, 56). Shortly after the shootings and through a digital and social media campaign, the activist students organized national school walkouts and a main rally in Washington, D.C. with approximately 800 rallies around the country occurring at the same time (Zoller and Casteel, 2021).

At the rallies and through various media outlets including social media, the surviving young people from MSDHS educated and shamed the nation. Alfonso Calderon, a co-founder of Never Again, explains how he is certain fellow Never Again founder, Emma Gonzalez, is accurately educating the world with her widely shared “B.S.” speech that was passionately and tearfully given at the D.C. rally, as well as through social media and other speaking engagements. Calderon states “Even before this happened, we already knew all the facts. We already knew everything ... if she were to say something that was non-factual, you know she would be highly scrutinized by literally everybody, including the President [Trump]” (Witt, 2018, n.p.). Additionally, perhaps benefiting from experience as a reporter for the high school newspaper, Never Again co-founder, David Hogg, appeared confidently asserting facts on national news broadcasts and demanding action from elected officials.

The internet and digital media communication platforms as well as other forms of media create new opportunities for youths to act as educators, to develop collective movements’ identities and to mobilize resources “for strengthening movements and creating coalitions (Earl and Kimport, 2014)” (Mundt et al., 2018, 12). This entry attempts to highlight some of the ways youth have utilized technologies and communications for informal teaching and learning during social justice movements. However, by illuminating youth as the educators, leaders, and main participants during various social movements, our intention is not to shift the focus away from the education and messages that the movements provide (Applegarth, 2020), nor are we gesturing toward the usefulness of comparing movements that emerge in different spatial, temporal, political, and cultural contexts. Central to the informal teaching and learning highlighted in this entry are significant social justice issues with embodied consequences such as gun violence, racism, coloniality, ableism, sexism, homophobia, and more. Thus, although the focus of this writing is on how youth engage with technologies and communication mediums for social movement making and informal teaching and learning, the information and demands from the movements should remain the priority. Furthermore, the internet “is a rapidly developing arena for political action, and there is a great deal of work still to be done to understand the relationship between [youths’] online and offline engagement” (Keating and Melis, 2017, 891).

Conclusion

Youth are educators from the moment they enter this world, even if at times they are only teaching themselves. Thus, to narrow the scope of this entry, we focused on how young people use technologies and forms of media communication to educate others about a need for social and/or political change. We began by highlighting scholarly discussions related to informal and formal learning. Then, we traced some of the responses of fearful adults regarding young people’s informal learning when “new” technologies and communication mediums emerge (i.e., the radio, movies, television, video games, the internet). Next, we provided examples of ways young people have utilized technologies and communication mediums available to them for informal learning while acting as youth educators and activists laboring on behalf of social justice causes. Through this tracing, we hope to elucidate how the apprehension or fears about youth engaging in deleterious informal learning via new technologies might be unwarranted or unnecessarily elevated at times. Furthermore, we agree with scholars such as Buckingham who assert that rather than corrupting young people, we can witness youth utilizing technology and media for democratic participation and social justice aims.

We end by suggesting that what we want informal or formal learning or education to do or be is the same as asking what we want society to do or be. We imagine a society that honors knowledges and ecologies across species and elements—a society that conceives of knowledge as non-hierarchical, multiple, malleable, and contingent. We also wonder if the time spent by adults who were panicking about new technologies might have been better used for collaborating with youth (like those who engage in participatory action research) to figure out how to make our world more just—or to create an entirely different and just world. Miles Horton, an educator who uses a form popular education with young people who want to educate for social change, argues in his autobiography, *A Long Haul*, that

If we are to have a democratic society, people must find or invent new channels through which decisions can be made ... the problem is not that people will make irresponsible or wrong decisions. It is, rather, to convince people who have been ignored or excluded in the past that their involvement will have meaning and that their ideas will be respected. The danger is not too much, but too little participation (1990, 134).

Exclusion and ignorance are not the foundations of liberation or a just society. Young people like those referred to in this entry are teachers and learners and seek to have meaningful engagements. It might be better for all of us if we find ways to include, encourage, and support youth working on behalf of justice.

Moving forward our questions are not related to whether informal and formal learning are separate, nor are our inquiries the result of an accumulation of speculations about the potential harms of new technologies—there is too much actual suffering happening in the immediate moment that requires our attention. Instead, we ask how we might use technologies and media to collectively collaborate for the creation of informal and formal learning and education that center on limiting fear and amplifying love and liberation? With youth as a resource, how, when, and where can we act transformatively with abolitionist intentions for freedom and justice?

This research received no specific grant from any funding agency in the public, commercial, or not-for-profit sectors.

Introduction

Private supplementary tutoring, operating in parallel to regular schooling, has a history as long as that of schooling itself. However, only in recent decades has it become a major phenomenon and attracted significant attention.

Publications in English and in some other languages commonly use the term ‘shadow education’ on the grounds that the curriculum of tutoring changes as the curriculum of regular schooling changes, and that as the school system grows so does its shadow. The metaphor was first used in Malaysia, Singapore and Japan in the early 1990s, and then the first global comparative study using the metaphor was published in 1999 by UNESCO’s International Institute for Educational Planning (Bray, 1999). A sequel to this book was published a decade later (Bray, 2009), and has been followed by various regional studies (e.g. Bray, 2021a,b; Bray and Hajar, 2023; Bray and Lykins, 2012). Other writings with a global focus include Aurini et al. (2013), Park et al. (2016), and Enrich (2021).

This entry to the encyclopedia commences with definitions and scope, and then moves to the scale and nature of shadow education. The following pair of sections focuses on drivers of demand and of supply, and the entry concludes with remarks about social and political implications.

Definitions and scope

The definition of shadow education presented by Bray (1999: 20) has been widely followed in the literature (e.g. Aslam and Atherton, 2014; Tan, 2009; Zhang and Yamato, 2018) and is employed in this paper. It has three components, namely:

- *Supplementation*. The focus is on subjects that are already covered in school, and does not include for example language classes for minority children whose families are anxious that new generations retain competence in languages not taught in their schools.
- *Privateness*. The focus is on tutoring provided in exchange for a fee. It does not include free tutoring by relatives or by teachers as part of their school duties.
- *Academic*. The focus is on subjects taught in schools, particularly languages, mathematics and other examinable subjects. It does not include musical, artistic or sporting skills that are learned primarily for pleasure and/or more rounded personal development.

This entry is concerned with the subjects learned in primary and secondary schooling. Shadow education does also exist at pre-primary and post-secondary levels. The phenomenon at these levels also deserves attention but it is excluded here in order to permit greater depth.

The forms of shadow education may be varied. Some tutoring is provided one-to-one in the homes of either the tutors or the clients. Other tutoring is in small groups, in large classes, or even huge lecture theaters with video screens to cater for overflows. Tutoring over the internet has become increasingly common, both on a one-to-one and one-to-group basis. Internet tutoring may include the dual-tutor model in which the main tutor is at a distance while a teaching assistant works with students in their groups, to make sure that they have understood and to follow up on activities.

Scale and nature of shadow education

Historically, shadow education has been most prominent in East Asia. South Korea has long been famous for its tutorial institutions called *hagwons* (Kim, 2016), and in 2019 according to official statistics 83.5% of elementary-school, 71.4% of middle-school, and

67.9% of general-high-school students were receiving private supplementary support (KOSIS, 2020). Neighboring Japan is equally famous for its *juku* (Enrich, 2018; Sato, 2012), and in recent decades shadow education has been very prominent in Hong Kong, Singapore and Taiwan (Bray and Lykins, 2012). Mainland China had a slower start, but until the promulgation of fierce regulations to dampen the industry (China, 2021, 2022) had caught up with and even overtaken other parts of the region (Feng, 2021; Zhang and Bray, 2021).

Other world regions also have countries in which the phenomenon is particularly visible. In Europe, Greece has long been the most prominent with its tutorial institutions known as *frontistiria* (Tsiloglu, 2005). In North Africa the counterpart country is Egypt (Hartmann, 2013); and elsewhere in Africa, Mauritius stands out for its long history of the phenomenon (Foondun, 1992). In general, however, shadow education across the world has not been of major significance until recent years. This is among the reasons for paucity of statistical information, especially data collected on a common yardstick across national boundaries.

One of the few cross-national statistical surveys of shadow education was undertaken by the Southern and Eastern Africa Consortium for Measuring Educational Quality (SACMEQ). Researchers in 15 education systems surveyed Grade 6 students during 2007 (SACMEQ, 2010). They found that shadow education was most prominent in Mauritius, with 74.6% of students receiving it, followed by Kenya (46.3%) and Uganda (25.1%). At the other end of the scale were Eswatini (1.1%), Lesotho (2.5%), Namibia (2.9%) and South Africa (4.0%). However, a repeat survey in 2013 showed significant increase. In Mauritius the proportion had risen to 81.4% (Dwarkan, 2017, p. 37), in Namibia it had risen to 5.8% (Shigwedha et al., 2015, pp. 35–36), and in South Africa it had risen to 29.1% (Chetty et al., 2017, p. 16).

Other indicative data can be derived from the Programme for International Student Assessment (PISA) operated under the auspices of the Organisation for Economic Co-operation and Development (OECD) (see e.g. Byun et al., 2018). These surveys have been conducted every three years since 2000. However, from the perspective of shadow education as defined here the surveys have limited usefulness first because of ambiguities in the questions, second because of problems with translations of the questions, and most of all because they have not clearly asked whether the tutoring was fee-free or fee-charging (Bray et al., 2020).

Even when they are available, national statistics on enrollment rates require much elaboration, in particular to include information on the types of shadow education, on the modes of delivery, and on the identities of the tutors and tutees. For example with reference to Egypt, Sieverding et al. (2019, pp. 567–568) distinguished between private lessons (*durus khosouseya*), on a one-to-one or small-group basis outside schools, and “fortification” lessons offered in schools but after hours for a fee. Data cited by Sieverding et al. indicated that 53% of primary, lower secondary and general upper secondary students received private lessons, most of which were in the students’ or teachers’ homes but some of which were in tutorial centers operated by companies. The in-school fortification lessons, received by about 10% of students across levels, were operated in larger classes and were commonly perceived to be inferior to private lessons.

Fig. 1 elaborates on possible modes of shadow education. It shows not only group sizes but also the media through which tutoring may be provided, several categories of providers, curricula, purposes, and levels of education.

Further variations are evident in the seasons and durations of tutoring. In Angola, within a sample of Grade 11 and 12 students surveyed by Chionga (2018), 28.3% received tutoring all the year round, 23.3% during parts of the school year, and 48.3% during the examination season. In Kenya, private tutoring has commonly been delivered not only after the school day and at weekends but also during school holidays (Mogaka et al., 2016).

Drivers of demand

Throughout the world, the greatest driver of demand for shadow education is social competition. This is especially evident at the season of watershed examinations that determine opportunities for further study and/or employment. Families increasingly consider schooling to be inadequate by itself to meet their aspirations, and view shadow education as a supplementary component to secure advantage. Then, as more and more families secure the supplementation, others have to join in or face being left behind.

To some extent, this pattern reflects global expansion of schooling in line with advocacy by UNESCO and others in the Education for All (EFA) movement (see e.g. UNESCO, 2000). During earlier periods of history, average levels of schooling were modest and in some societies even completion of lower secondary or even primary education distinguished the holders from the crowd. But as first primary and then lower secondary education became universal, upper secondary and then university education were needed to secure distinction from the crowd. Indeed some societies have reached the point at which a university degree is not enough and postgraduate qualifications are necessary.

These patterns have two implications. First, families that in previous eras would have left school, not aspiring to remain in the system because few possibilities were on the horizon, now find that they can compete with others and seek shadow education to assist in that competition. Second, because unit costs are greater at higher levels of education, government budgets are stretched. This may impact on the quality of education, causing frustrated families to seek private tutoring to bridge gaps (Bray, 2017).

Insofar as education is a positional good (Hollis, 1982), a major aim among parents is to secure better grades than other parents and then access to more prestigious schools and universities in order to enhance subsequent careers and life chances. Yet once one group of parents does this, others feel obliged to do the same until patterns build up to what Lampl (2017, p.2)

Fig. 1 Diversity of modes of shadow education delivery. Reproduced with permission from Zhang and Bray (2020, p. 328).

has called an educational ‘arms race’. This pattern to a significant extent underpins the expansion of private tutoring in England and Wales. Holloway and Kirby (2020, p. 171), presented data from Sutton Trust surveys of students aged 11–16. When asked in 2005 whether they had ever received paid private tutoring, 18.3% replied affirmatively. Eleven years later, a repeat survey found that 26.2% replied affirmatively, and that proportions were 43.8% in London.

The EFA movement has also contributed to the growth of shadow education insofar as the expansion of schooling was only achieved at the expense of qualitative decline. Many families perceive schooling to have inadequate quality, particularly when classes are large and teachers are not motivated.

Diversity in supply

In the commercial sector, much diversity is evident in the sizes, types and market reach of companies. Around the world, the majority of companies are small and serve their immediate localities. In China, for example, one report (MobData Research Institute cited by Zhang, 2019: 27) grouped industry operators into three categories: (i) nationwide companies operating with branches in first- and second-tier cities on the way to reaching third-tier cities, (ii) region-wide companies operating across one province or municipality, with branches mainly in first-, second- and third-tier cities, and (iii) smaller enterprises which ranged from one-person workshops to medium-sized companies. The first category at that time accounted for less than 5% of the market share, while the third category accounted for the majority.

In contrast to these local and national companies are multinationals such as Kumon which is headquartered in Japan. Kumon operates on a franchise model and has 4.3 million subject enrolments (i.e. if one person enrolled in three subjects, that would be three subject enrolments) in 50 countries (www.kumon.org). Kip McGrath is headquartered in Australia and operates through franchises in four continents. Alongside them are companies such as Sylvan and Oxford Learning.

The above remarks about the size of enterprises also have implications for urban/rural distribution of services. Cities usually have more higher-income families able to afford private tutoring, and also have sufficient density of population for companies to attract viable numbers of clients. Universities, which commonly provide many students seeking pocket money

from informal supply of tutoring, are also more likely to be located in cities. In this respect, shadow education tends to exacerbate urban/rural disparities in access to and use of educational provision. The extent of such disparities has been shown in diverse contexts. In Czech Republic, for example, 47.5% of the students in Prague sampled by Št'astný (2016: 20) were receiving tutoring, compared with 35.9% in the more rural Moravian-Silesian region. Similarly in Bangladesh, comparison of secondary students receiving private tutoring in English showed 84.7% doing so in Dhaka but only 60.7% in a rural area (Mahmud and Bray, 2017: 303).

Another major source of tutoring supply, more balanced across urban and rural areas, is the mainstream teaching profession. In many countries, regular teachers offer private tutoring as a way to supplement their incomes (Bray, 2021c). In some settings this is officially sanctioned, albeit with Ministry of Education regulations on which categories of teachers are permitted to tutor which categories of students, when and where (see e.g. Malaysia, 2006; Tunisia, 2015; United Arab Emirates, 2019). In more settings, however, such private tutoring by regular teachers is prohibited (see e.g. Egypt, 1998; Pakistan, 2019). The main social benefit of private tutoring by regular teachers is that it makes a resource available to students in need, and thus enhances their learning and human capital development. By supplementing the teachers' incomes, it also helps to retain teachers in the profession. However, such tutoring also raises the danger that teachers neglect their regular duties, for which their incomes are more or less guaranteed, in order to devote more time and effort to their private tutoring. Further, such tutoring can raise major issues of conflict of interest when teachers tutor students for whom they are already responsible during regular lessons. Writing about Cambodia, Dawson (2009) referred to 'the tricks of the teacher' which included deliberately withholding essential content during regular lessons in order to ensure that students enrolled in supplementary classes.

For these and other reasons, governments are increasingly paying attention to regulation of the tutoring sector (Bray and Kwo, 2014; Choi and Cho, 2016; Zhang, 2019). The school sector has long been regulated, albeit with gaps around the world in the enactment of these regulations, and now the tutorial sector is catching up. However, regulation for the sector is more challenging than for schooling because of its fluid nature. Much of the supply, especially by informal suppliers, is *ad hoc* and does not adhere to fixed timetables and locations. Especially challenging for regulation is provision via the internet, which may even be across national boundaries. For such reasons, some governments place emphasis on educating and empowering the consumers so that they can themselves demand appropriate behavior from tutoring providers (Bray and Kwo, 2014). Such bottom-up measures to promote accountability may be more effective than top-down regulations.

Social and political implications

The great global expansion of shadow education has brought increasing recognition of social and political implications alongside educational ones. These implications especially concern social inequalities, since it is obvious that more prosperous families can afford greater quantities and better qualities of private tutoring than can lower income families. Indeed in many contexts families increasingly feel that "schooling is not enough", and turn to the shadow sector to complement as well as supplement. Then the children whose families cannot afford tutoring, or cannot access it e.g. because they live in rural and remote locations, are left behind at the starting line.

These matters raise questions not only about regulation of the shadow education sector but also about possible enlargement of access. Some commentators (e.g. Lampl, 2017) have recommended government provision of vouchers to enable low-income families to invest in tutoring. However, such action would amount to official recognition that indeed schooling is not enough, and would be a further move toward privatization and marketization of the education sector in line with controversial ideologies of neoliberalism. Shadow education in some respects seems to challenge the institutions of schooling, in many settings employing untrained tutors yet displaying flexibility and tailored support in ways that families find attractive.

An alternative approach is suppression of the sector, exemplified by the Chinese government policy launched in 2021 (China, 2021, 2022). As noted by various commentators, however, this policy is tackling the symptoms rather than the underlying causes (Zhang, 2021). Comparable attempts in South Korea launched in 1980 had to be ameliorated first *de facto* and then officially in 2000 (Bray, 2009, pp. 47–54). Patterns elsewhere seem similarly to be more accommodating of shadow education, albeit with stronger regulatory approaches.

To address such matters effectively, a starting point is to take the topic more firmly 'out of the shadows'. Governments, academics and others can help by securing more data on its scale, nature and impact. And policy makers, administrators, schools and community bodies can usefully dialogue on what sorts of shadow education are likely to be of most benefit to whom and, by corollary, what sorts are likely to threaten wider goals of social and educational development.

On February 26, 2012, Trayvon Martin, a 17-year-old Black boy, was walking home from a convenience store in Sanford Florida, when a violent vigilante racially profiled, stalked, confronted, and killed him. Nearly two months later, after numerous rallies demanding justice, Trayvon's killer was arrested and charged with second-degree murder. After a not guilty verdict was returned on July 13, 2013, two Black queer women, Alicia Garza and Patrice Khan-Cullors, began a series of social media posts that led to the creation of a modern-day movement for Black liberation. In response to a love letter to Black people posted by Garza, Khan-Cullors typed three words that would become an international rallying cry for racial justice: #BlackLivesMatter (Khan-Cullors and Bandle, 2017). As the killings of unarmed Black people continued to galvanize the US and the world, #BlackLivesMatter grew into an international grassroots movement fighting for Black liberation. From protests to teach-ins, the explosion of #BlackLivesMatter struck a chord in many Black people leading to the organizing work from the larger coalitional work of the Movement 4 Black Lives (M4BL).

In 2016 as the assault on Black life continued with the killing of Philando Castille and Alton Sterling, teachers in Seattle Washington organized the first #BlackLivesMatter day of solidarity in a public elementary school. Despite the attacks that ensued including a bomb threat to the school, the teachers at John Muir Elementary wore t-shirts, collaborated with Black-led organizations, and created a curriculum to support students' understanding of the #BlackLivesMatter movement. A month later, educators across Seattle spearheaded a city-wide Black Lives Matter at School day with over 3000 teachers participating in the second #BlackLivesMatter solidarity event in schools (Au and Hagopian, 2018). As word of these and other events spread, "... the 'Black Lives Matter' cry for freedom hopped on the yellow bus, walked through the school-house door, occupied the gymnasium, rallied in the auditorium, ripped up the textbooks, and took over the daily lesson plans" (Hagopian, 2020, p. 1).

(Au and Hagopian, 2018)

From the streets to the school house

The ushering of Black Lives Matter at School, as a national movement, came from the principled, strategic, and organizing efforts of educators from Philadelphia, Pennsylvania who witnessed the Day of Action that took place in Seattle and expanded it to a Week of Action. Members of the Caucus of Working Educators (WE) Racial Justice Organizing Committee (RJOC), inspired by the events in Seattle, came together to plan a week of action for students in Philadelphia. Tamara Anderson notes how their work was not prompted by a specific local event but rather a response to ongoing issues that plagued the Black and Latinx populations in their district (Anderson, 2020). They intentionally set out to make their event inclusive of issues beyond education such as housing, poverty, and fair wages. Thus they invited parents, college faculty, and local organizers as partners to help build what became the Black Lives Matter Week of Action (Anderson, 2020). As word of the week of action in Philadelphia spread they immediately received pushback. Those opposed to racial justice labeled #BlackLivesMatter as anti-police and a terrorist organization. As it became clear that some members of the caucus were confused about the purpose and not willing to embrace the week of action, the Philly organizers made a strategic decision to counter the attacks.

We responded to this pushback by re-centering the narrative on the truth of the Black Lives Matter movement, a grassroots movement for "freedom, liberation, and justice." We also faced fear with truth by using the blueprint of Black Lives Matter's thirteen guiding principles, which emphasize inclusive values, including restorative justice, globalism, and trans affirming, and, the power that resides in being unapologetically Black and no longer silent or invisible. The thirteen principles laid the groundwork for our planning and curriculum, and eventually, for the week going national.

Anderson (2020, p. 51).

(Jones and Hagopian, 2020, p. 201).

On January 21, 2017, the Caucus of Working Educators posted a link to their Black Lives Matter Week of Action Calendar of Events on Facebook. The Google doc compiled links to K-12 curriculum resources to teach the 13 Guiding Principles (13GPs) on different days of the week, and information on activities and events planned throughout the city. In addition to the Week of Action calendar, the Philly organizers prepared a FAQ guide with talking points for educators, families, and parents as leverage for teachers to receive support from school administrators (Anderson, 2020).

Photo taken at Free Minds Free People 2017

As word of the first Black Lives Matter Week of Action spread, the Philly organizers were invited to present their work at the Free Minds Free People conference in Baltimore in July of 2017. The Philly organizers would use the FMFP conference space to recruit more education organizers and build a base to move what they started with the Week of Action in their local community and move it onto a National stage. Attendees learned about their week of action, the 13 GPS, and the initial success and challenges they faced. A signup sheet for those interested in organizing a similar Week of Actions was sent around and the call to action made its way to other events such as the Charlottesville Teach-in where organizers co-planned and developed the relationships that would lead to the National BLM at School movement teach-in Charlottesville, Virginia. In October of 2017, the first national planning meeting met over zoom with representatives from New York, New Jersey, and Washington, resulting in the National Black Lives Matter at School (BLMAS) movement. The National Week of Action was officially named the Black Lives Matter at School Week of Action and would be held the first week of February across the country.

An all-Black national steering committee was formed to ensure the work of BLMAS would remain in the hands of Black educators, activists, and organizers. Though not officially affiliated with #BlackLivesMatter (BLM) chapters, BLMAS embraced the grassroots, Black feminist organizing styles of the larger movement. During the fall of 2017, the BLMAS steering committee organized virtual meetings to support the organizers across the country in developing their own Week of Actions (WOA) for February 2018.

Through the national steering committee, a national curriculum committee was created to assist teachers in developing lesson plans and other materials. Building off of curriculum resources created by the Seattle educators and Philly organizers, the national curriculum committee created accessible Google folders that housed a vast amount of K-12 and higher education lesson plans and resources. Local WOA organizers were invited to create and share their calendar events while the national steering committee organized outreach webinars, endorsements, and a website to share resources and promote events. On Monday, February 5, 2018, the first BLMAS WOA began in 20–30 cities across the US.

BLACK LIVES MATTER

PRINCIPLES

<https://blacklivesmatter.com/about/what-we-believe/>

PRINCIPLE	DESCRIPTION
RESTORATIVE JUSTICE	We intentionally build and nurture a beloved community that is bonded together through a beautiful struggle that is restorative, not depleting.
DIVERSITY	We acknowledge, respect, and celebrate differences and commonalities.
EMPATHY	We practice empathy. We engage comrades with the intent to learn about and connect with their contexts.
LOVING ENGAGEMENT	We embody and practice justice, liberation, and peace in our engagements with one another
QUEER AFFIRMING	We foster a queer-affirming network. When we gather, we do so with the intention of freeing ourselves from the tight grip of heteronormative thinking, or rather, the belief that all in the world are heterosexual (unless s/he or they disclose otherwise).
TRANSGENDER AFFIRMING	We are self-reflexive and do the work required to dismantle cisgender privilege and uplift Black trans folk, especially Black trans women who continue to be disproportionately impacted by trans-antagonistic violence. We make space for transgender brothers and sisters to participate and lead.
UNAPOLOGETICALLY BLACK	We are unapologetically Black in our positioning. In affirming that Black Lives Matter, we need not qualify our position. To love and desire freedom and justice for ourselves is a prerequisite for wanting the same for others.
BLACK WOMEN	We build a space that affirms Black women and is free from sexism, misogyny, and environments in which men are centered.
BLACK FAMILIES	We make our spaces family-friendly and enable parents to fully participate with their children. We dismantle the patriarchal practice that requires mothers to work "double shifts" so that they can mother in private even as they participate in public justice work.
BLACK VILLAGES	We disrupt the Western-prescribed nuclear family structure requirement by supporting each other as extended families and "villages" that collectively care for one another, especially our children, to the degree that mothers, parents, and children are comfortable.
GLOBALISM	We see ourselves as part of the global Black family, and we are aware of the different ways we are impacted or privileged as Black people who exist in different parts of the world.
INTERGENERATIONAL	We cultivate an intergenerational and communal network free from ageism. We believe that all people, regardless of age, show up with the capacity to lead and learn.
COLLECTIVE VALUE	We are guided by the fact that all Black lives matter, regardless of actual or perceived sexual identity, gender identity, gender expression, economic status, ability, disability, religious beliefs or disbeliefs, immigration status, or location.

NYC WOC Calendar 2018

Grassroots organizing for racial justice in schools

A curriculum for Black Lives

The WOA focuses on teaching the 13GPs and engaging students and the community around the four national demands (See [Table 1](#)). Chris Rogers who transitioned from contributing to the Philadelphia curriculum to chairing the national curriculum committee shared the process of curating educational resources.

The educational resources that I and others developed in 2017 were grounded in a belief that centering the words and deeds of Black freedom fighters in the classroom would have a liberatory potential for all involved. In that initial year, we were able to set up a framework that performed what Barbara Ransby calls "political quilting" – bridging movement work across time and place, and nurturing relationships and mass awareness. We learned that by recognizing the inherent intellectual practice in diverse organizing traditions, we were building a rich repository to reimagine the purpose of education towards a praxis of liberation.

Rogers (2020, pp. 58–59).

Rogers goes on to note how the work of collecting primary and secondary sources from Black-led justice organizations amounted to a "curricular strike" where the corporate neoliberal curriculum is set aside to make space for communities of color to center their cultural knowledge and freedom dreams (Rogers, 2020, p. 59).

In January during the MLK holiday weekend, the national curriculum committee released a revised set of curriculum resources to support the WOA. The national curriculum included book lists, lesson plans, specialized syllabi, posters, and other resources for early childhood, elementary, and high school students. To help prepare educators to effectively use the curriculum materials, local cities held curriculum fairs before the WOA began. Teachers new to the BLMAS movement could come together to learn about the 13GPs, hear from the experience of teachers who participated in the past or created lessons, and collect curriculum resources. The collective work of curricular organizing stems from a long tradition of Black educators creating curriculum materials to subvert the dehumanization and erasure of Black lives (King, 2014).

Early in the growth of the national movement, the BLMAS curriculum was made accessible to young learners. When Laleña Garcia, a kindergarten teacher in New York City, first learned about the WOA, she began by translating the 13GPS into child-friendly

Table 1 Thirteen guiding principles (13GPs) by day.

Monday	Loving engagement, restorative justice, empathy
Tuesday	Globalism and diversity
Wednesday	Trans affirming, queer affirming, and collective value
Thursday	Intergenerational, black villages, black families
Friday	Black women and unapologetically black

Table 2 BLMAS 13GPs with *child-friendly language* (in italics).

Restorative justice is the commitment to build a beloved and loving community that is sustainable and growing. “We know that if you knock down someone’s block building, you have to help them rebuild it, you can’t just say, “Sorry,” and walk away. We also know that it’s important for kids to be able to make a better choice another time, and it’s grownups’ job to help them make better choices and to give them chances to do that. Another way to say that is restorative justice.”
Empathy is one’s ability to connect with others by building relationships built on mutual trust and understanding. “It’s so important to think about how other people feel, because different people have different feelings. Sometimes it helps to think about how you would feel if the same thing that happened to your friend happened to you. Another way to say that is empathy.”
Loving engagement is the commitment to practice justice, liberation and peace. “It’s so important to make sure that we are always trying to be fair and peaceful, and to engage with other people (treat other people) with love. We have to keep practicing this so that we can get better and better at it. Another way to say that is loving engagement.”
Diversity is the celebration and acknowledgment of differences and commonalities across cultures. “Different people do different things and have different feelings. It’s so important that we have lots of different kinds of people in our community and that everyone feels safe. Another way to say that is diversity.”
Globalism is our ability to see how we are impacted or privileged within the black global family that exists across the world in different regions. “Globalism means that we are thinking about all the different people all over the world, and thinking about the ways to keep things fair everywhere.”
Transgender affirming is the commitment to continue to make space for our trans siblings by encouraging leadership and recognizing trans-antagonistic violence, while doing the work required to dismantle cisgender privilege and uplift black trans folk. “Everybody has the right to choose their own gender by listening to their own heart and mind. Everyone gets to choose if they are a girl or a boy or both or neither or something else, and no one else gets to choose for them.”
Queer affirming is working toward a queer-affirming network where heteronormative thinking no longer exists. “Everybody has the right to choose who they love and the kind of family they want by listening to their own heart and mind.”
Collective value means that all black lives, regardless of actual or perceived sexual identity, gender identity, gender expression, economic status, ability, disability, religious beliefs or disbeliefs, immigration status or location, matter. “Everybody is important, and has the right to be safe and happy. Another way to say that is collective value.”
Intergenerational is a space free from ageism where we can learn from each other. “It’s important that we have spaces where people of different ages can come together and learn from each other. Another way to say that is intergenerational.”
Black families creates a space that is family friendly and free from patriarchal practices. “There are lots of different kinds of families; what makes a family is that it’s people who take care of each other. It’s important to make sure that all families feel welcome.”
Black villages is the disruption of western nuclear family dynamics and a return to the “collective village” that takes care of each other. “There are lots of different kinds of families; what makes a family is that it’s people who take care of each other; those people might be related, or maybe they choose to be family together and to take care of each other. Sometimes, when it’s lots of families together, it can be called a village.”
Black women is the building of women-centered spaces free from sexism, misogyny, and male-centeredness. “There are some people who think that women are less important than men. We know that all people are important and have the right to be safe and talk about their own feelings.”
Unapologetically black is the affirmation that black lives matter and that our love, and desire for justice and freedom are prerequisites for wanting that for others. These principles are the blueprint for healing and do not include nor do they support ignoring or sanitizing the ugliness and discomfort that comes with dealing with race and anti-race issues. “There are lots of different kinds of people and one way that we’re different is the color of our skin. It’s important to make sure that all people are treated fairly, and that’s why we, and lots of other people all over the country and the world are part of the Black Lives Matter movement.”

Source: Garcia (2020, pp. 141–144).

language. She notes, “I hoped that the kid-friendly language would provide a jumping-off point for educators who wanted to bring the principles into their classrooms while remaining age-appropriate for their young students” (Garcia and Clark, 2020, p. 135, see Table 2). In addition to articulating the 13GPs into kid-friendly language, Garcia worked with NYC art teacher Caryn Davidson to create a coloring book to engage preschool-age children. Together they published two activity books, one for preschoolers and another for K-fifth grade students that examine each principle and provide reflective questions, letters to adults, and a teacher’s guide.

In addition to the 13GPs, the national BLMAS steering committee issued four demands for all school districts in the US to work toward educational justice for Black lives.

1. End zero tolerance discipline and mandate restorative justice.
2. Mandate Black history and Ethnic Studies.
3. Hire more Black teachers.
4. Fund counselors, not cops.

When the first national BLMAS WOA launched in 2018, there were three national demands, however, after the assault of a Black girl by a school resource officer in South Carolina, the steering committee agreed to add the fourth demand. Some local WOC organizers have adopted demands specific to their communities.

Local WOA organizers plan events including youth-led rallies that focus on the demands. The national steering committee collaborates with multiple racial justice organizations to garner support for the demands. Since BLMAS went national, Seattle public schools adopted a resolution in support of ethnic studies. After the murder of George Floyd, students in Minneapolis and Oakland successfully worked to defund school police. Thus, centering the demands is an important component of the WOA and the national movement for racial justice in schools.

BLMAS Demands Poster by Caryn Davidson

Struggling for union support and BLMAS in higher education

In the United States, there are two national teachers' unions: The American Federation of Teachers (AFT) and the National Education Association (NEA). Teachers become members of either union depending on where they teach, and the union is authorized to engage in collective bargaining on behalf of the teachers. Five states prohibit collective bargaining while others permit and some mandate bargaining. Teachers' salaries, benefits, and working conditions are often negotiated through collective bargaining. Unions can also provide support for initiatives by endorsing them and even providing funds at the local level. Thus, early on in the BLMAS national movement, many educators attempted to gain union support through endorsements at the local and national levels. NEA was the first national union to endorse the WOA and encourage teacher participation at the local level. Beginning in 2020 NEA Ed Justice, the digital center for racial justice resources in NEA, created a map for teachers to list their BLMAS WOA events and maintains a Black Lives Matter @ School web resource page for members. Given this level of support, teachers who are members of NEA were able to successfully pass resolutions endorsing the WOA. These endorsements provide protection to teachers from attacks by anti-racial justice groups.

The AFT finally endorsed the BLMAS WOA in 2021 after many local chapters struggled to gain union support. In NYC, the WOA organizers failed to secure an endorsement from their local United Federation of Teachers (UFT) until the national endorsement from AFT came in 2021. Without union support teachers in NYC were at risk of being reprimanded for participating in the WOA. Myrie, a NYC teacher, and chapter leader shared how securing union support for BLMAS was crucial to supporting the struggles of BIPOC (Black, Indigenous, and People of Color) students. He notes

You see the difference in LA and Chicago unions as leadership and the rank and file immerse social justice demands in their contracts. This is the way it is done. The leadership of the LA and Chicago unions is part of UCORE, and hence the urgency to engage its membership about the students they serve and meeting students' and their families' needs.

Jones and Hagopian (2020, p. 105).

After AFT endorsed the BLMAS WOA, the NYC organizers continued to advocate for full support. As the attacks on Critical Race Theory (CRT) and the banning of books and teaching about racism continue to grow, WOA organizers must have full protection from their unions.

Early in the development of the national BLMAS movement, many higher education professors and researchers endorsed the WOA. A higher education committee was formed in 2018 and many colleges of education introduced the WOA to their teacher education students. Higher education WOA organizers often host panel discussions, film screenings, and curriculum fairs. Some even take up the demands as they relate to their institution. Dana Morrison, a professor at a college in Pennsylvania, worked with the Philadelphia organizers on a research project which led to her involvement in BLMAS. During a 2018 planning meeting, she began discussions with other faculty and graduate students which led to a partnership of 30 people from five local colleges and

universities. She notes how this “initial work brought together educators of all levels around a common concern, racial justice” and “re-centered [her] commitments as a critical educator and built relationships with other teachers in ways [she] never thought possible” (Jones and Hagopian, 2020, p. 197).

Higher education involvement came in multiple ways, including a Black Lives Matter Early Childhood Symposium at Bank Street College in New York. Takiema Bunche Smith was the Director of the Center on Culture, Race, and Equity, when she organized the first Early Childhood Symposium as part of the 2019 BLMAS WOA. After learning about the WOA, Takiema immediately recognized the need to center the youngest Black children in our fight for racial and education justice. Her goal was to situate the historical fight for Black freedom with an emphasis on Black children and how the denial of Black humanity starts at birth. She states, “When we think of a three-year-old, we may picture a child playing, but for Black children, their bodies have been seen as commodities and they’ve been denied that opportunity. During enslavement, Black children as young as three were made to work in the fields” (Jones and Hagopian, 2020, p. 153). Noticing how young Black children were often not included in these historical discussions, Takiema approached her college leadership with the idea of an early childhood symposium as part of the BLMAS WOA. Each symposium highlighted a different aspect of anti-Black racism in the early years and provided a rare professional development experience that centers Black children.

From a week of action to a year of purpose and a lifetime of practice

The global pandemic of COVID-19 necessitated the shutdown of the world as well as taking notice of all the ways systems have impacted people’s lives, particularly the lives of Black, Indigenous, Latinx, and other People of Color. The Movement for Black Lives uprisings of 2020 that swept the globe after the state-sanctioned and extrajudicial murders of George Floyd, Breonna Taylor, Tony McDade, Ahmaud Arbery, and others named and unnamed, ignited new urgency and radical possibilities for advancing abolitionist practice and uprooting institutional racism.

The uprising for Black lives in 2020 prompted the National Black Lives Matter at School movement to expand its proposed activities from a “*Week of Action*” to a “*Year of Purpose*,” and Lifetime of Practice in addition to the annual Week of Action held during the first week of February. The centerpiece of the *Year of Purpose* asks educators to reflect on their own work in relation to antiracist pedagogical and abolitionist practices, persistently challenging themselves to center Black lives in their classrooms. Additionally, as part of the *Year of Purpose*, educators are asked to participate in intentional days of action throughout the school year uplifting different intersectional themes vital to making Black lives matter in schools, communities, and beyond.

The formal and informal learning environments we aspire to create reflect a deep understanding of the experiences of Black children, families, and communities, as well as our own ongoing work of critical self-reflection and personal transformation. The questions we are compelled to ask ourselves in perpetuity are: Are we creating humanizing communities that respond to the concerns of our students? Are we committed to leveling up our expectations for Black students? The *Year of Purpose* compels educators to turn inward in order to reach outward, linking their efforts to broad, integrated movements for social justice and change.

As our ancestor, the Black lesbian warrior poet Audre Lorde, stated, “There is no such thing as a single-issue struggle because we do not live single issue lives.” This means we must commit to living our principles every day, in and out of our classrooms, within our homes, and with our communities. It is a commitment to the village.

Integral to the *Year of Purpose*, the excerpted questions chosen are meant to support educators—and parents who are educating their children at home during the pandemic—throughout the year. The questions below, as well as pieces from the paragraphs above written by Awo Okaikor Aryee-Price, Maria Fernandez, and Christopher Rogers, first appeared in the Education for Liberation Network’s educator plan book *Planning to Change the World: A Plan Book for Social Justice Teachers* (2019–2020). We invite educators and educators-in-training to meditate on the questions that follow, and—given that no such list can be comprehensive—to pose questions of their own. Only through deliberate reflection can we realign our teaching practices to meet our current challenges and invent new practices where there are none. Additional information about the *Year of Purpose* and opportunities to participate are available at BlackLivesMatterAtSchool.com.

Year of Purpose self reflection questions

1. What is our school’s relationship to Black community organizing? Do we have relationships with local movement organizers? Do they see our school as a place that believes in their mission? Do they see our school as a place to connect with local families?
2. How are school-wide policies and practices—especially disciplinary practices—applied across categories of race? Do problematic patterns emerge when we look at how policies are applied to Black students and when we also consider the intersections of gender, sexual orientation, and (dis)ability with Blackness?
3. How are the voices, accomplishments, and successes of Black folx uplifted in my lessons, units, and curriculum? Rather than focus on singular events or individuals, does my approach highlight the everyday actions and community organizing that will lead to change?
4. In what ways do our practices erase the histories of our students and prevent them from bringing their whole selves into the learning environment?
5. How do I understand the role that local/state laws and policies have on the educational experiences of my students? What is my role in working to change policies, regulations, and practices that harm Black students and families?

Black Lives Matter at school national days of action

In addition to self-reflection questions, the Year of Purpose encourages educators, parents, organizers, and community members to participate in the following days of action throughout the year. Each action is grounded in the Movement for Black Lives Principles that we adopted as well:

First day: Black to School (varies depending on each district's designated first day of school)

- Wear the Black Lives Matter at School shirt
- Review the Black Lives Matter at School reflection questions and write up an anti-racist action plan for the year
- Graffiti Wall: "What are we going to do differently this year to further the movement for Black lives in our school."
- Post a video to social media
- Twitter chat

October 14th: Justice for George Day

Principle: Restorative Justice

October 14th is George Floyd's Birthday. Justice for George is a day to remember George Floyd and call for the defunding of the police and the redirecting of those funds toward social programs and education.

November 20th: Transgender Day of Remembrance

Principle: Trans Affirming

November 20th,
Transgender Day of Remembrance and William Dorsey Swann Day.

December 3rd: International Day of Persons with Disabilities

Principles: Globalism and Collective Value

December 3rd is International Day of Persons with Disabilities Day. Harriet Tubman, and Fannie Lou Hamer are two disabled freedom fighters we revere, even as the disabilities they carried with them into struggle are not consistently lifted up as assets in their fight. To fight against societal ableism, we must celebrate our differences and understand how the lessons from the Disability Justice movement and Black disabled organizers teach us how to build inclusive, accessible movements.

January Queer Organizing Behind the Scenes

Principle: Queer Affirming

January- During January, we find it critical to lift up Bayard Rustin, one of the principal organizers behind the March on Washington which is crowned as one of MLK's lasting achievements. To be queer-affirming means lifting up our queer ancestors who were at the foundation of our movements throughout time. This deepens the purpose of MLK day to understand that no one person makes a movement, highlighting how MLK's legacy encompasses the contributions of many.

February 18th: Unapologetically Black Day

Principle: Unapologetically Black

During this day, we celebrate the life's work and contributions that Audre Lorde and Toni Morrison have made to our collective movements. They are not only freedom fighters, but they share the same birthday February 18th, and so we lift them up and celebrate them.

March 6th: Student Activist Day

Principles: Loving Engagement and Empathy

March 6th: Barbara Johns Black Student Activist Day is a day to celebrate Black student activists and organizers.

- Philly artist (M. Brian Bowens) who created this amazing solidarity piece to show unity and activism through compassion and empathy. <https://bbsketch.com/store>

April Revolutionary Black Arts

Principle: Intergenerational

April- During National Library Week, we seek to center the classic contributions of Black Writers and artists across the generations: Zora Neale Huston, Faith Ringgold, Alma Thomas, Augusta Savage, Jasmine Mans. How are the themes and radical vision that they brought to their art reflected in your classrooms and communities? How can young people extend on these legacies?

May 3rd: Black Radical Educator Day

Principle: Black Villages

On May 3rd, Septima Clark's birthday, we celebrate Black Radical Educator Day.

June 5th: #SayHerName Day

Principle: Black Women

June 5th, Breonna Taylor's Birthday–Day to call for justice for Breonna and uplift the #SayHerName movement.

June 19th: Education for Liberation Day

Principles: Black Families and Diversity

Juneteenth: Education for Liberation Day is a day to celebrate the struggle that brought down slavery and reflects on what must be done to win Black liberation.

Last Day of School: A Day for Self-Reflection

Review all 13 principles

On the last day of school, we ask that educators, students, parents, community people, and organizers lift up Reflection Day; a day to reflect on your year of antiracist teaching and abolitionist practices. This can be an activity that people do individually or within a group.

Conclusion

For the past five years, the organizers from the National Black Lives Matter at School have been able to build upon the work that Black grassroots organizers, past and present, have laid the foundation for with no institutional financial support or backing. This not only speaks to the passion, but the persistent and visionary spirit of radical Black educators and organizers who refuse to be deterred by the structural limitations designed to keep us hopeless. The seeds that were planted by the educators, parents, and community members from the Black Lives Matter at School Seattle events that led to the Philly Week of Action, then the forming of the National Black Lives Matter at School grew from the work of previous generations and will continue on for future generations.

Introduction: (re)framing young women and activism

Young women are often used rhetorically to justify campaigns for larger political initiatives designated as democratic or progressive projects. This rhetorical framing positions young women as innocent, pure, and in need of protection (Sensoy and Marshall, 2010). In other words, young women are discursively constructed as the recipients or objects of global citizenship practices rather than active agents or subject-makers in cultural and political citizenship. Furthermore, racist, and imperialist narratives bifurcate young women into categories of those who need to be saved and those who save (Khoji-Moolji, 2018). Postcolonial feminists articulate how Western feminism perpetuates the narrative of “white women saving brown women from brown men” (Abu-Lugood, 2002; Spivak, 1988; Subedi and Maleku, 2021). Drawing from these critiques, this chapter seeks to (re)frame the position of young women within global discourses on democracy, citizenship, and social justice. Specifically, my account aims to provide a critical aperture in such discourses by illuminating how young women, as knowledge producers and cultural makers, participate in a wide range of activist initiatives that may be considered dissent.

In order to explore young women’s participation in global discourses on democracy, citizenship, and social justice, I want to unpack the relations between resistance, activism, and dissent. I argue that each is important, yet distinct, and deserve separate attention. I use the term resistance to describe an act, thought, or feeling that opposes another act, thought, or feeling. Resistance involves embodied dynamics that are historical, biographical, and geopolitical (Anzaldúa, 1987; Weems, 2015; Rhee, 2021). I assume that power is an expression of human agency where young women navigate specific ways of knowing and being through particular subject positions available to them through global and local discursive practices, structures, and relations (Foucault, 1984, 1989, 1991; Ong, 1996; Sandoval, 2000). More specifically, I use the term “resistance” to refer to acts that challenge, or contend with, particular “regimes of truth” as conceptualized in within disciplinary formations of power/knowledge (Foucault, 1984). As Foucault notes, power/knowledge is a product of language, institutional structures, subjectivity, and relations of power. Foucault suggests that institutional structures (such as schools, religion, politics, etc.) involve technologies of control and regulation as authoritative formations of disciplinary power/knowledge but which also produces the potential for disruption through resistance. In this sense, Foucault connects discursive, symbolic, and material conditions in theorizing power/knowledge that circulates through and among heterogeneous bodies, identities, talk, text, and images. Yet, as a productive and distributive force, resistance is possible through embodied transactions that challenge disciplinary and localized forms of power/knowledge. Thus, I employ Foucault’s emphasis on resistance within micro and meso-level contexts and places. Sometimes resistance is intentional; sometimes it may be an unconscious and/or visceral reaction to disciplinary habits and dispositions. The point is that is that resistance is neither inherently political nor made visible for public consumption.

In contrast, I conceptualize activism as physical acts, talk, text, and images that are *intentionally constructed within/through collectivist and/or community-based forms of resistance* that may occur through street protests, demonstrations, cyberactivism, etc., Grounded in particular socio-cultural, geopolitical, and economic contexts, activism “makes sense” through regional definitions, rituals, and forms of collective resistance that may be implicitly or explicitly designed for movement-building. In this way, activism involves an attunement to macro social and political sensibilities and practices. Yet, activism, like resistance, *does not necessarily signal a progressive oriented ideologies or invested in diversity, equity, and social justice agendas, especially given the growing rise of right-wing global populisms*. However, given my investment in a feminist transnational praxis, my analysis foregrounds young women’s activism for social justice based in global discourses on radical democracy.

I use the term dissent to refer to a particular type of active resistance that is intentionally constructed against some ideology, social practice, structure, etc., Perhaps the most common example of dissent is the policy of the US Supreme to allow Justices to express disagreement to a majority outcome of a legal decision. Given this etymology, I define dissent as those statements, images, physical and/or symbolic acts that are conscious and intentional. Dissent operates within, and responds to, an openly politicized decree, doctrine, policy, law and/or initiative *precisely* to raise awareness among a larger audience. Thus, while dissent always already operates within historical and socio-cultural spaces, it is designed to intervene in public and/or popular narratives/discourses involving cultural politics, community norms, and narratives of citizenship. Dissent reflects contested dynamics that traverse onto-epistemological, socio-cultural, and geopolitical boundaries and is aimed at symbolic as well as material change.

Novelist and activist Arundhati Roy characterizes the kind of urgent (and vigilant) disposition of transnational feminist praxis this way,

What we need to search for and find, what we need to hone and perfect into a magnificent, shining thing, is a new kind of politics. Not the politics of governance, but the politics of resistance. The politics of opposition. The politics of forcing accountability. The politics of slowing things down. The politics of joining hands across the world and preventing certain destruction. In the present circumstances, I'd say that *the only thing worth globalizing is dissent* (2002, n.p.).

Taking a cue from Roy, I argue that *dissent* is a *productive* form of power/knowledge/resistance that is both healthy and necessary for democratic societies toward achieving a more planetary vision of social justice and critical global citizenship (Andreotti, 2014).¹ Thus, my analysis documents the localized (yet traveling) forms of young women's activism and dissent against the intersectional oppression of young women across borders of tribal, cultural, and national citizenship. Grounded in critical discourses of education for empowerment, I believe that activism serves as a site of critical knowledge production and global citizenship (Curley et al., 2018).

I conceptualize feminist activism as acts, events, relationships, creative and cultural productions that are *intended* to promote critical consciousness, social change, political organizing, and/or movement building involving issues related to gender. More specifically, my analysis charts contemporary activism that might be construed as part of "transnational feminist praxis" (Grewal and Kaplan, 1994,99 2000; Alexander and Mohanty, 2010; Baksh and Harcourt, 2015; Sharoni et al., 2015). As such, I present some of the empirical international scholarship on young women and activism in formal and non-formal settings. The empirical data demonstrates how young women (*cis*, queer, *trans*) participate in strategic initiatives against gender-based violence, toward racial, reproductive, and environmental justice. I've selected these four areas to illustrate how young women engage in copious forms of social justice activism in transnational context. My analysis then concludes with a discussion of young women's activism as part of a more expansive worldview of education, pedagogy, and activism as global citizenship (Curley et al., 2018).

Notes on transnational feminist approach

Throughout this essay, I primarily focus on young women rather than girls. This focus is a result of my own experiences working with young women from diverse backgrounds in the United States, as well as my expertise in transnational scholarship on young women. My formal training as a language arts high school teacher in the US Midwest and community educator (with Planned Parenthood and the Youth Action Agency) was formative in understanding "young women" as a heterogeneous category nuanced by inequitable structures of racialization; economic and citizenship status; linguistic, cultural, and religious traditions; and educational opportunities. These experiences, coupled with my epistemological grounding in woman of color feminisms, crystallized my long-term interest and commitment to working with minoritized young women. Through active marginalization, members of a particular group become "minoritized" as not (quite) citizens—or "Others."

Post-colonial feminist theorist Gayatri Spivak coined the concept of "Othering" (1985) to describe the processes and outcomes of the marginalization of myriad persons or populations in a particular society (or geopolitical location). Othering is a form of cultural imperialism that bifurcates people into binary categories such as native/foreigner, good/evil; primitive/civilized, etc. Imperialist/racist/heteronormative constructions of the Other are embedded into governmental, corporate, and non-profit policies and discursive practices of subjectivity and citizenship. These cultural binaries and hierarchies lead to the institutionalization of Othering and minoritization. In these terms, young women across the globe are minoritized around issues of gender identity (Raub et al., 2016) and sexual orientation (Suen and Chan, 2021), whether they are *cis*- or transgender, because of prevailing heteropatriarchal logics, affects and structures (Minh-ha, 1989; Mohanty, 2003; Alexander, 2005; Reddy et al., 2009; Pin, 2018).

Drawing from scholarship in feminist transnational studies, this chapter focuses on the embodied and creative forms of activism and dissent deployed by young women in (g)local movements against colonial, capitalist, white supremacist, and heteropatriarchal social arrangements. My use of the term "transnational" and "young women of color" are not simply found descriptions; rather, I deploy their use in ways to suggest that myriad complex forms of multiracial and international solidarity are possible and desirable

¹Written in 2002, Roy's statement on dissent takes for granted that the politics of resistance works against domination and oppression. However, given the increase of cultural and political conflict within and across national boundaries over the past 20 years, it is no longer safe to assume that even resistance is automatically tied to democratic or social justice-oriented models of activism and dissent.

in part through an active rejection of the trope of “global sisterhood” (Banda, 2015; Mohanty, 2013). According to Mohanty, the discourse of global sisterhood attempts to center feminist struggles in the Global North articulated through institutionalized forms of feminist projects (such as North American women’s studies literature, feminist NGOs, etc.). In contrast, transnational feminist praxis can be thought of as a loose series of localized responses to “scattered hegemonies” (Grewal and Caplan, 1994). In other words, scattered hegemonies of patriarchy mean that women experience gender-based oppression differently, and in turn, produces activism that is both situated yet connected to a larger agenda that links women’s rights’ with ‘universal human rights’ even while the categories of women and the universal remain “sites of incessant contest and resignification” (Butler, 2002).

Transnational feminist praxis explores how sex and gender-based discrimination and oppression are further compounded by other forms of minoritization or what Patricia Hill Collins (1990) refers to as interlocking systems of oppression. For example, young women of African descent women are minoritized within and across national borders due to the legacies of the transatlantic slave trade, white supremacy, and contemporary global anti-Black racism. Similarly, since 9/11, there is an uptick in violence against ethnic and religious minorities within and across nation-states fueled by populist nationalism and weaponization of Islamophobia, xenophobia, im/migration politic in the name of the “war on terror” (Jones et al., 2017). More recently, there is a rise in anti-Christian sentiment and persecution in countries such as India, China, Nigeria, and North Korea despite the global dominance of Christianity (Sherwood, 2021). Systemic policies, and practices fuel discrimination and violence driven by “ethno-racial” politics within, across state, national and continental borders (Pon et al., 2013). The particularities of these interlocking systems of oppression are named and experienced differently across geopolitical borders (see discussion below). Nonetheless, Crenshaw’s notion of “intersectionality” is a helpful way to characterize the exponential ways in which poverty, patriarchy, and cultural imperialism work to both disenfranchise and demonize those who are Othered (Crenshaw, 1991).

This weaponization of fear and hate against the very bodies, identities, and communities of young women that are actively minoritized leads to an existence of “living hells” driven by “carceral capitalism” (Wang, 2018). While young women may be “protected” by national and international edicts and proclamation of “rights,” their meaningful participation in the classroom, workplace, government, media, medical, scientific, and technological dimensions of subjectivity and citizenship are effectively diminished and/or nullified. It is not simply that minoritized young women are overlooked or underserved. Their real and imagined lifeworlds are constrained by the contemporary landscapes of global and racial capitalism, militarized necropolitics, racial and religious extremism, and intersectional violence.

Against this backdrop, young women (especially minoritized young women) actively resist or contest the material conditions and cultural politics of their local community in a myriad of forms (physical demonstrations, boycotts, blogging, digital culture jamming, etc.). Young women participate in formal and informal forms of associations and organizing to address gender-related issues at the local, regional, and global arena. For the remainder of this chapter, my analysis presents a curated archive of young women’s activism based on two criteria. First, I foreground young women’s activism that operates from an intersectional perspective that allows for the analysis of interlocking systems of oppression such as race, gender, social-economic status, sexuality, and youth. While these categories of identity and difference are historically produced social constructs, they produce material consequences that are embedded in political and economic structures, as well as institutionalized cultural ideologies and policies. Thus, my primary interest is young women’s activism that challenges a “politics of domination” (Hooks, 1986) across multiple sites of knowing and being. Secondly, I foreground forms of activism that directly center issues facing young women as *embodied subjects* (such as violence based on sexuality and gender identity (SOGI), as well as struggles for justice where young women are disproportionately affected (such as reproductive, and climate-based justice).

In the next section, I provide a skeleton of some issues and modes of young women’s activism. The scope of my account is limited to initiatives related to four major areas; (1) violence against women; (2) reproductive justice (including issues related to Sexuality and Gender Orientation as well as HIV/AIDs); (3) racial justice; and (4) activism for climate justice. These four areas provide concrete examples of intersectional and transnational contemporary activism among young women. I conclude the section on issues with a provide a brief discussion of the need to shift discourses on young women and empowerment from “access to equity in schools”—toward a vision of activism as dissident global citizenship.

A snapshot of contemporary young women and activism—issues

One way to track young women’s global activism is to look for international registries of political and cultural organizations dedicated to the young women’s rights, equity, and justice. According to a survey conducted by FRIDA (a research arm of the Association for Women’s Rights in Development (AWID, n.d.)), Young Feminist Organizations (YFO) are relatively new and diverse but integrated into larger coalitions for women’s rights. The FRIDA report identified the following areas of primary concern for YFOs: “gender-based violence; sexual reproductive health and rights; and political and economic empowerment for women.” Gender-based violence was a key driver for young women’s activism across geographic locations whether in the form of sexual harassment, rape, domestic abuse, hate crimes, murder, or femicide. However, additional areas of immediate concern were also associated specifically with geopolitical locations. For example, in Sub-Saharan Africa, economic empowerment and HIV/AIDS prevention are pressing issues, while LGBTQI rights were reported as the most pressing challenges facing YFOs in countries within the Americas as well as the Middle East and Northern Africa. Young women in YFOs across Asia (Central, South, Southeast, and East), reported feeling unsafe to participate in formal social movements due to surveillance and physical intimidation by governmental and religious extremism.

Issues—violence against young women and women

The World Health Organization (WHO) considers violence against women to be a violation of women's rights and thus, human rights more broadly. According to their 2021 executive report, 1 in 3 women in the world experience either intimate partner violence or non-partner sexual violence or both. Thus, one of the most predominant issues among young women activists is to end one or more forms of violence against young women and women. Activists characterize violence in broad but concrete terms including but not limited to physical and emotional coercion and abuse, sexual harassment, and rape. In addition, young women are particularly affected by femicide, forced sterilization, forced marriage, honor killing, and state-sanctioned gender-based violence (such as the crisis of Missing and Murdered Indigenous Women, Girls and Two-Spirit persons in North America and the governmental failure to produce justice for their families). Furthermore, as Truong notes, neoliberal globalization has enflamed the rise in sex trafficking and commercial surrogacy (2015).

Organizations such as the Rape, Abuse, and Incest National Network in the United States provide direct services such as the sexual abuse hotline as well as act as a clearinghouse of resources for survivors, researchers, and policymakers. Similarly, the African American Policy Forum gathers and distributes contemporary statistics of violence against Black, and Latinx young women in the United States. Individual young Black women, such as Nupol Kiazulu and Naomi Wadler, both from the United States, are part of a new cadre of young feminists committed to intersectional activism. For example, during her speech at the 2018 March for Our Lives, Wadler detailed the impact of gun violence on Black and Latinx youth. As Wadler noted, young women of color are acutely aware of their precarity due to their multiple layers of oppression and physical proximity to gang-related, anti-Black racist, and police-based violence. Consider the tragic case of Oluwatoyin "Toyin" Salau, a young Black woman who organized a protest at the Tallahassee (Florida) Police Department after Tony McDade, a transgender man, was fatally shot by the police. As a result of her visibility, however, Salau was subject to physical and cyber-bullying and ultimately killed in a "domestic dispute." Unfortunately, Salau's case is far from the exception; organizing against gender-based violence, especially as a young woman of color, or as a queer or *trans* youth of color, makes one a target for further attack. Thankfully, there are a growing number of community-based organizations whose approach to ending GBV is to focus on creating space for survivors to process trauma and heal alongside other survivors (ALWH). Moreover, organizations such as the Chicago-based Girl/Friends Institute cultivates "the empowerment of young people that amplifies the voices and creative visions of those most vulnerable to violence: girls and women of color" (ALWH). Graduates of the 5-week summer Girl/Friends Institute then take peer education and social justice campaigns to local schools and community events.

Issues—reproductive justice, SOGI, and HIV/AIDS

Young women across the globe are at the forefront of organizing for comprehensive reproductive justice. Reproductive justice involves access to safer sex education as well as access to birth control, abortion, and prenatal care. For some young feminist activists, reproductive justice also includes access to affordable childcare and programs that de-stigmatize sex work and LGBTQ2S identities. Reproductive justice activists advocate for women's bodily autonomy—defined as the ability for individuals to make decisions about their bodies without restriction, fear, or coercion (Rodríguez, 2021; UNFPA, 2021). According to the 2021 State of the World Population Report, approximately 55% of women globally (despite a nation's wealth or status) do not possess bodily autonomy due to interpersonal relations, community-based norms, and/or legal restrictions. In response, the Center for Women's Global Leadership launched an annual initiative to end gender-based violence in 1991 called 16 Days of Activism. Over the past 30 years, over 6000 organizations across 187 countries have participated in the initiative that links the International Day Against Violence Against Women (November 25) to the International Human Rights Day (December 10) and include World AIDS Day (December 1st). 16 Days of Activism has spread globally to include partnerships with IGOs, NGOs, and local communities through street activism, press campaigns, and digital messaging. More recently, corporations and other organizations within civil society have offered their support such as the 2021 theme "Orange the World" through orange-colored lights and logos on buildings and billboards.

In the FRIDA report, one of the primary areas of concern were issues regarding sexual orientation and/or gender identity, and specifically, those particularly affecting Lesbian, Gay, Bisexual, Transgender, Queer, or 2Spirit persons. However, issues of sexual orientation and gender identity (SOGI), like educational issues, vastly differ from country to country. For example, 69 countries currently criminalize homosexuality including some that are accompanied by the death penalty. Most of the 69 countries that legally criminalize are in Africa and other parts of the Global South.

Beyond the criminalization of homosexuality, non-LGBTQ inclusive policies are scattered (distributed) across the Global North and South. Lack of protection in social policies (such as employment, housing, education, etc.) leads to harassment, violence, and hate crimes directed toward queer, *trans*, and nonbinary persons (Suen and Chan, 2021; Mampane, 2020). Across the globe, Black *Trans* women are not only highly targeted for gender and race-based violence; crimes against them are often left uninvestigated or unprosecuted, compounding the trauma for the person, family, and larger LGBTQ community.

In terms of intersectional activism on SOGI, I commend organizations or networks that proffer "support not stigma" for folks who are multiply marginalized such as LGBTQ2S youth who are sex workers (Maggies of Toronto or AF3IRM) or undocumented (Undocuqueer) or homeless (Benn, 2017). It is no surprise that these examples of highly visible community-based supports for LGBTQ2S youth are based in the Global North and reflects how agency and activism are a function of the material conditions that make possible certain political claims and forms of cultural citizenship (Gopinath, 2005; Queisada et al., 2015; Bapat, 2021). For example, Gopinath argued about the "impossibility" of the lesbian subject in 2005 India given the rise of Hindu

nationalism. Just 15 years later, the members of Queer Crescent, an organization based in Los Angeles, California, created a menu of cultural and religious resources for LGBTQI Muslims across the Islamic world. In other words, geopolitical privilege allows young activists to build more visible and funded community-based networks to support SOGI issues or issues that affect LGBTQ2S youth. Such community-based networks are likely to exist across the globe, yet given the political and cultural climate, they may be underground.

In many parts of the world, young women are disproportionately affected by HIV/AIDS and other infectious diseases due to inadequate access to safer sex education, preventative health care, and resources to affirm and accommodate living with HIV/AIDS (The Global Fund, 2019). As of December 2021, 53% of the 37.7 million persons living with HIV are women (WHO, 2021). So, while the numbers of infected persons reflect a “gender balance,” it is important to note that the most vulnerable populations include sex workers, gay men, men who have sex with men, transgender women, and IV drug users. Put simply, transmission is correlated with poverty, sexual violence, and transphobia. Thus, HIV/AIDS activists are currently working to decrease discrimination and social stigma and improve political, social, and economic conditions.

One area that has been significantly impacted by HIV/AIDS is Sub-Saharan Africa, where it is estimated that every week, 7000 girls and young women between the ages of 15–24 become infected.² In turn, young women in Sub-Saharan Africa are at the forefront of HIV/AIDS advocacy and services for children, youth, and adults (Yola et al., 2019; Hollis, 2019). Besides organizing for direct access to medical services, young women such as Jane Emmanuel (Tanzania) and Gogontlejang Phaladi (Botswana) are working to secure more comprehensive health services and education including a newer trend to include the psycho-social impact of HIV/AIDS on individuals, families, and communities. Emmanuel serves as a peer educator and support group facilitator for HIV + teens (Ped-AIDS, 2020). Phaladi, at just 5 years old, created the Gogontlejang Phaladi Pillar of Hope Organization (GPPH) as a charitable organization to support youth who are infected and/or orphaned by HIV/AIDS. With the help of her parents, Phaladi grew GPPH into a nongovernmental organization that focuses on human rights and gender equality. Since then, Phaladi has taken up leadership positions (such as a global ambassador or regional director) to both offer her expertise as well as serve as a visible role model for young African women to become entrepreneurs, philanthropists, and professionals. This type of advocacy is often linked to IGOs, NGOs, and other non-profit organizations and rely on their financial sponsorship for maintaining everyday services. Thus, the visions, goals, and aims of such organizations are often framed through international reform initiatives such as the United Nations Sustainability Development Goals (SDS) or the Partnership for Maternal, Newborn & Child Health (PMNCH). In contrast to the NGO model, there are also grassroots organizations mobilized by and for local HIV + individuals and coalitional networks such as the Brazil RNP+ and the Durbar Collective of sex workers in Calcutta, India (Chose, 2012). Both organizations either meet in person or connect through closed groups within social media platforms such as WhatsApp™. Both aim to empower HIV + individuals yet provide a level of discretion and protection within a larger context of political and religious intolerance where stigma has been weaponized to create place-based hotbeds of transmission and violence.

Issues—racial justice activism

Perhaps the most visible public campaigns led by young women in the 21st-century center racial justice: including countering anti-Blackness, colorism, casteism, and the particular issues that affect women at the intersections of class, gender, and race. In North America, for example, young Black women have been at the forefront of sustaining and progressing the Black Lives Matter (BLM) movement through local direct actions, protests, social media campaigns, and classroom projects (Troutman and Jimenez, 2016). Institutes like the African American Policy Foundation, founded by Dr. Kimberle Crenshaw, have played a pivotal role in creating a sustained movement for research and advocacy regarding young Black women (especially with regards to violence, education, and the Prison Industrial Complex (PIC) in the United States.

Often young women activists espouse a platform that understands power, privilege, and oppression as intersectional, institutionalized, and relational. Yet there are complexities to these claims. First, we know that all knowledge is partial and situated and that persons who benefit from hegemonic relations often do not recognize their limited reflexivity. For example, US Black Feminist scholar Jennifer Nash cautions that Black women are disappeared even as “intersectionality” becomes institutionalized in organizations of/for women. For Nash, the ongoing structure of institutionalized racism often leaves Black women either outside or marginalized within discourse practices of “Black Feminism” in academic circles.

A second complexity of the espoused platform of intersectionality is the important distinctions between various geopolitical definitions of which social categories are of most importance in terms of analyzing systems of power, privilege, and oppression. For example, in many countries in the Global North (United States, Canada, Australia, and the United Kingdom) young feminist activism draws from the US Black feminists such as Kimberle Crenshaw, Patricia Hill Collins, and bell hooks, to think about how the “holy trinity of oppression: race, class, and gender” particularly affects young women of the African diaspora (Johnson, 2018). Whereas, in the Global South, it is not uncommon to see explicit campaigns that connect femicide to Western imperialism, governmental censorship, militarism, environmental degradation, and economic instability (Antrobus, 2015).

To be sure, young activists draw from local and historically situated frames of difference (such as ethnicity, religion, caste, citizenship, and/or language) to understand the symbolic and material practices of power, privilege, and oppression they experience. In turn, activists mobilize by and through the rhetoric and platforms of local leadership and movements for equity and justice. For

²<https://www.theglobalfight.org/women-girls-and-hiv/>.

example, young feminist organizing in Northern and Western Africa is especially attuned to differences in ethnicity, religious affiliation (Arab, Muslim, Christian, Indigenous), and geographic status (rural/urban). Whereas young feminist organizing in Sub-Saharan, or South Africa often includes campaigns against gender-based violence, homophobia, and HIV/AIDS stigmatization as central to the health and wealth of the nation and its young population (Zerai et al., 2017) And, as Sharoni et al. (2015) note, (US-based) feminism can learn from the Boycott, Divestment, and Sanctions (BDS) movement for justice in Palestine to imagine and create issue-based coalitions (2015). This situated understanding of intersectionality, and social justice echos the transnational solidarity work of the BDS anti-apartheid movement in South Africa during the 1980s and the current anti-occupation alliance between Black Lives Matter and Palestinian activists (Davis, 2016; Salam, 2021). As Armstrong notes, a critique of Western feminism along the axis of South-South commonality has at times allowed for women's movements to take the shape of a provisional anti-imperialist feminist solidarity toward a "leftist women's internationalism" aimed to mobilize rural and urban peasants (2016, p. 308).

Environmental issues—climate justice & land sovereignty

Greta Thunberg (Sweden) may be the world's most identifiable young activist regarding climate change and environmental justice. In 2018, Thunberg then 14 years old, catalyzed an international "School Climate Strike" (SCS) where young people across the globe protested the lack of attention and action by elected officials regarding the deleterious effects of climate change. Thunberg has leveraged media visibility to publicly confront leaders from European parliaments and the United Nations and for the most part, received positive reception. And it is important to recognize that millions of young activists across the globe are also deeply involved in informal and formal movement-building for climate and environmental justice (especially Indigenous youth across the Americas, Asia, and Africa), sometimes with criminal prosecution and penalty. One such prominent figure is Disha Annappa Ravi (India) who mobilized the Fridays for Future (FFF) network to support the 2020–2021 Indian Farmers protests. Ravi was arrested for sedition for her involvement including the use of social media to create awareness about the protests. Similarly, several of the young women who took part in the frontline of the anti-Dakota pipeline (#NODAPL) initiative at the Standing Rock reservation in North Dakota, USA, faced police brutality and criminal charges simply for serving as water protectors as they are known in their community. As Tokata Iron Eyes from Respect our Water notes, indigenous leaders and tribal citizens are the most equipped to promote and educate the kind of activism environmental justice necessary to stop planetary degradation and recalibrate the inter-relationships between humans, animals, earth, sky, and water.

Modes of activism among young women

Young women engage in myriad modes of activities in the name of social change, equity, justice, and movement-building ranging from informal consciousness raising, education and formal leadership development. Whereas, the FRIDA report captured many of the YFOs that focus on capacity building, many of the young women discussed in this chapter could be characterized as young women who organize direct service, actions, demonstrations, or protests. This distinction is not intended to pit leaders against each other; rather my hope is to draw attention to the depth and breadth of activism among young women. Young women who are linked to colleges, universities, or other institutions that foster scholarship may be able to engage in participatory research with other young women, and women. These forms of university-community-based youth-led organizations can be extremely useful for two reasons. First, these partnerships often put the direct needs of the young women at the center of the research project. Second, such partnerships create the opportunity for capacity building by equipping young feminist leaders with research skills and building social capital (Edwards-Jauch, 2012; Wang, 2018; Bailly et al., 2020).

Direct protest/action

Within and across national and international boundaries, young women activists mobilize protests to raise awareness about state-sanctioned racialized, gendered, and sexual violence against Indigenous, Black, and racialized young women (Danforth, 2011; Garita, 2015; Kurian et al., 2015; Pastor and Hernandez, 2021; Phillips, 2020; Truong, 2015). From China to Mexico to South Africa and India, young women form grassroots-based collaborations for direct action. The most common form of direct action is a street march or protest to draw attention to sexual or gender-based violence (Molestane, 2018). For example, Zee Thomas, 15, of Nashville, Tennessee, worked with five of her friends to lead a march to denounce the police killing of George Floyd (Bennett, 2020). What she thought would elicit a small gathering turned into a crowd of 10,000. For sure, the Black Lives Matter movement has sparked the fire for young Black women to take their rightful place as the next generation of leaders for social change.

Young feminist protests or direct actions can include creative demonstrations, teach-ins, and workshops to illuminate the embodied nature of heteropatriarchy and the intergenerational effects of femicide. For example, young feministas in Latin America have responded to a five-year surge in femicides in multiple ways. It is estimated that 20 million women in Mexico participated in a work strike during the month of March 2020. Young feministas also staged mass protests at highly visible locations such as the Attorney General's office and covered the National Palace with red paint. Young feminist organizations such as Circulo Violeta (Mexico) and Colectiva Feminista in Construcion (Puerto Rico) combined direct tactics of traditional political activism with cultural and creative forms of resistance in the form of ceremonial remembrance (Chavez, 2021). It is not uncommon for protests to include

singing, dancing, spoken word, mural painting, and graffiti, as well as other sacred forms of ceremony across the Americas Caribbean to oppose and survive centuries of colonial rule. First Nations, Aboriginal, Native, and Indigenous leaders understand the importance of combining culture and creativity with the ongoing fight for justice and sovereignty. In *The Winter We Danced*, Sylvia McAdam (Saysewahem) notes, “our history is still unfolding; it’s led by our songs and our drums” (2014, p. 67). Similarly, a new generation of “image warriors,” such as Erin Konsmo (a self-described Prairie Queer of the Métis Nation) combine Indigenous land-based materials with Western art practices and technologies to promote awareness and connection through the online circulation of what might be considered protest art.

Digital media and CyberActivism

Digital technologies afford opportunities for radically conceptualizing how we think about the self, community, public as mediated spaces ripe for participatory action, and radical disruption of hegemonic images and narratives (Ong, 2006; Boler and Nitsou, 2014; Weems, 2009, 2014, 2018; Al Zidjali, 2017). Online activism, culture jamming, and digital dissent have proliferated in the 21st century with the growth of global infrastructures in information and communication technologies, as well as access to personal computers, and mobile devices. Greater access to the internet has allowed young women to produce and share content related to intersectional violence and oppression as it occurs in local settings (Mai and Laine, 2017; Schuster, 2013). In turn, activists have utilized the internet to connect with others to create solidarity and circulate testimonios, counternarratives, and strategies for action (Kimball, 2019; Tanner et al., 2020; Castilho and Romancini, 2017). For example, Janna Jihad and Ahed Tamami, two young women from the West Bank, utilize(d) Instagram, Snapchat, Facebook, and Twitter to report ongoing airstrikes and confinement of Palestinian citizens. Like other young female Palestinian women, Jihad and Tamami demonstrate their commitment to independence, activism, and social justice by documenting and drawing global attention to Israeli occupation and how they thrive under conditions of perpetual war, apartheid, and settler colonialism.

Some of the most successful examples of contemporary social movements that grew from effective online mobilization are #Black Lives Matter, #NuEnos, #MeToo, and #IdleNoMore. Each of these initiatives began with a single Twitter post that grew by instant recirculation to become crowdsourcing. The phenomenon known as “hashtag activism” can be traced back to the Arab Spring uprisings in the 2010s when governments across the Middle East cracked down on censorship and media coverage (Moss, 2012).

As Jackson et al. (2020) note, hashtag activism allows for “networks of racial and gender justice” advocates to connect, share information, organize, and document actions. For many people around the world, hashtag activism allows for social movements to flourish despite the rising climate of political and religious (conservative) extremism. Yet, it is important to remember that social media can also function as surveillance or to transmit misinformation. As Jillian York (2021) notes, the move to online or digital technologies as a platform for movement-building means that corporate definitions of free speech and acceptable content now operate alongside governmental standards of censorship and technologies of surveillance to uphold them.

Community collaboration/art installations

Besides street protests and media campaigns, another form of activism involves community-based cultural events, exhibits, or collaborative art installations (Matherly, 2013; Desai and Abeita, 2017). One such collaboration is the group Walking with Our Sisters, founded in 2012 by an intergenerational group of First Nations and Métis women to raise awareness of the violence against Indigenous women and the alarming silence among politicians, policymakers, and the media. The art installation consists of over eighteen hundred vamps (the top part of a traditional moccasin) hand-beaded by more than thirteen hundred artists from across North America. Many of the vamps are beaded together in community in activities that integrate the learning of traditional arts, cultural forms of association such as intertribal and intergeneration dialogue, sacred reflection, and raising political awareness. The vamps are created in intergenerational circles of First Nations, Métis, and Indigenous women and men. Similarly, natives and non-natives work together to prepare, transport, and install the exhibit to ensure it retains a spiritual and culturally appropriate form of display. Since 2012, the Walking with Our Sisters exhibit has traveled across provincial and tribal borders due to the collective power of crowdsourced funding. As they write, “There is power in numbers, and there is power in art” (WWOS, 2014).

One of the most potent aspects of the WWOS project (and similarly the Red Dress Project) is that it links remembrance, local funds of knowledge, cultural practices with political aims that are community oriented. Like much of the participatory research with young Indigenous women, the aim is to celebrate and sustain the resiliency of the group as much as the individual (de Finney, 2017; Dhillion, 2015). Much of the highly visible feminist scholarship on young women and activism conflates cultural resistance with intentional opposition to formal political authorities (Fine, 2014; Taft, 2011). While this slippage can be problematic, it, nonetheless, makes possible a linkage between cultural resistance and political activism.

Indigenous scholarship on young women and activism makes explicit the connection between well-being, community organizing, and cultural revitalization as collective forms of citizenship toward sovereignty that is gendered, sexed, and tethered to body autonomy (Simpson, 2013; Dhillion, 2015; Lesperance, 2016; de Finney, 2017; Monchalin et al., 2016; Belcourt, 2020). Furthermore, this political work often involves intimate labor in that it focuses on collective and intergenerational notions of subjectivity and culture. Tribal elders and scholars of Native/First Nations studies recognize (and highly recommend) community-based practices of memory work, creative scholarship, and artistic production as legitimate forms of political participation and activism. Thus, *citizenship from below* emphasizes collective and intergenerational (but not necessarily biological) notions

of kin, culturally safe education, community-based cultural practices, and organized demonstrations against multiple forms of violence. I turn now to a more in-depth discussion of dissent, dissidence, and the potential for global citizenship from below.

Dissent, dissidence, and (global) citizenship from below

Despite their relative absence in official archives of political activism, young women take up, deploy, and subvert dominant discourses of subjectivity, culture, belonging, and citizenship. My interest is to investigate "*citizenship from below*" (such as grassroots or youth-led activism by foregrounding how young women of color play a key role in feminist, anti-racist, de/colonial, and transnational activism (Weems, 2014, 2018)). As I have shown, young women activists challenge contemporary efforts of neo-colonialism related to reproductive justice, land use, militarization, the corporatization of higher education, loss of Indigenous language and knowledge, and gendered violence (Walking With Our Sisters [WWOS], 2014). Through divergent strategies, these practices operate toward a vision of global citizenship through education, peace, and interconnectivity (Cristaldi and Pampolini, 2016).

In the beginning of this chapter, I argued that dissent embodies political critique on a larger scale, but which entails *particular* audiences being attuned to historically situated issues within modern contexts of mediated cultural productions (Maira, 2010; Mai and Laine, 2017; Weems, 2018). For example, Bhatia (2021) illustrated how a 101-day sit-in protest by a few Muslim women in a small locality in Delhi (Shaheen Bagh) catalyzed a national network of online dissent against the 2019 Citizenship Amendment Act (CAA). According to Bhatia, the ruling Bhartiya Janata Party Act effectively weaponized Hindutva ideology and demonized immigrant Muslims as potential "threats" to national security (1). Bhatia analyzed how participation in both offline and online protests and activism that position female Muslim body as a site of power/resistance and dissent. In this example, (mass) media served as a vehicle to construct certain bodies and communities as violent for purposes of regulating citizenship and controlling mobility. Yet in turn, digital media also served as a vehicle to produce bodies and communities of dissent through social media through communication about and documentation of the #womenofshaheenbagh and the handle @Shaheenbaghoff1. Thus, dissent is not simply about one exercising one's agency within a limited horizon of actions but is actively designed to make a statement and intervention to a larger, broader public regarding those limited conditions and their lingering effects. In this way, dissent is about protesting limited and oppressive conditions, exercising agency through action, as well as participating in an intersubjective struggle for "the non-coercive re-arrangement of desires" (Spivak, 2004, p. 526).

Sparks theorizes dissent as a radical relational practice that involves an ongoing struggle to "reconstitute the very boundaries of the political" (1997, p. 75). It is this ongoing position of dissent, particularly by members who are marginalized as unequal members of society, that constitutes a courageous form of dissident citizenship. Sparks writes:

I conceptualize dissident citizenship as the practices of marginalized citizens who publicly contest prevailing arrangements of power using oppositional democratic practices that augment or replace institutionalized channels of democratic opposition when those channels are inadequate or unavailable. Instead of voting, lobbying, or petitioning, dissident citizens constitute alternative public spaces through practices such as marches, protests, and picket lines; sit-ins, slow-downs, and cleanups; speeches, strikes, and street theater (1997, p. 75).

For Sparks, dissident citizenship involves creative oppositional practices by folks who are often excluded from formal institutional politics and employs courage to challenge both the content and form of citizenship. Thus, dissident citizenship illustrates the performative and discursive aspects of power and cultural politics (Darder, 2011; Butler, 2015). Dissident citizenship is performative in that bodies animate the affective dimension of belonging and exclusion and the disjuncture between these spaces. Dissident citizenship is also discursive in that actors are both deconstructing and re-inscribing multiple scripts laid out in political, juridical, and socio-cultural narratives crafted by and for historically situated agents (Sparks, 1997, p. 87).

The model of dissident citizenship, while useful in theorizing young women's activism and dissent, may also be limited in understanding citizenship as subject making (Ong, 1996) and/or the emphasis on sovereignty among indigenous, decolonial and transnational feminist activism (Simpson, 2013). First, I remain persuaded by Caribbean theorist M. Jacqui Alexander (1994) that "not just any(body) can be a citizen," given the onto-epistemological assumptions of Western philosophy. In other words, the very constructs of self/Other and citizenship are entrenched in colonial discourses that render some bodies human and others nonhuman, as well as classify and regulate ways of thinking and being into bordered categories of intelligibility and desirability (Wynter, 2003; Cankar and Maira, 2005; Somers, 2008). Furthermore, vying for entry into the political realm via official citizenship may not only be impossible for young women of color, but it may also be undesirable in favor of more sustainable and ethical forms of personhood, belonging, and governance.³

Thus, we might conceptualize young women's activism and dissent as a series of "scattered belongings" in response to "scattered hegemonies" of heteropatriarchy, global racism, and colonial capitalism. Understanding activism and dissent as scattered

³It may be helpful here to remember Mohanty's caution to challenge the "feminist individualist subject of much of liberal feminist theory" free from the legacies of imperialism (2003, p. 80). Thus, I am cognizant of how transnational feminist analysis (including my own) tends to re-center the Global North, the United States, and its nationalist mythologies and demands of assimilation, even as I attempt to interrupt this analytic (Swarr and Nagar, 2012; Wright, 2000; Sharoni et al., 2021).

belongings requires multi-layered and nuanced investigations of how young women interpret, navigate, and contest the “politics of domination” in their everyday lives. As such, they work *within and against* transnational feminist discourses of consciousness, praxis, and empowerment to reducing social inequality (Bhavnani, 2006; Africa-Young, 2021; Maira, 2017). Like their elders, young women activists practice dissent as an expression of dissident global citizenship on multiple levels of scale. Yet, it is important to name and claim young women’s global dissent as “small, small incidents” (Van der Tolen and Bol, 2011) of critical and inter-generational social capital that is built by “witnessing” and collaboration (Liebert and Thompson, 2015, p. 94). To return to Roy’s statement, I agree that we need to globalize dissent. What is necessary, then, is a flexible model of dissident global citizenship, one that operates to build and sustain larger networks (or archives) of transnational feminist praxis constituted by human, material, discursive, and digital resources ready for situated deployment against the politics of domination.

Dissident global citizenship is not a pre-determined set of ideological beliefs of strategies that are universally imagined or practiced. Rather, dissident global citizenship *requires framing and theorizing* young women as active participants in intersectional struggles against patriarchy, racism, colonialism, global capitalism, homophobia, and transphobia. Young feminist activists’ foreground embodied protest, digital dissent, and creative forms of socio-cultural and political citizenship as they are highly attuned to the global, affective, and (mediated) dimensions of cultural politics and social transformation. Digital media and other popular cultural productions afford the current generation of young women’s activism to connect and amplify creative dissent and dissident global citizenship through the production, circulation, and distribution of gifs, memes, blogs, videos, sampled beats, etc., that challenge the permeation and permanence of multiple layers of intersectional violence (Weems, 2015; Kumari, 2021). Our work as (elder) transnational feminists is to seek out and sustain opportunities for connection, collaboration, and solidarity across differences to transform gendered relations of power and oppression toward the eradication of violence and reproductive, racial, environmental, and anti-colonial justice.

This essay explores recent issues, frameworks, and social practices involving young women, and activism in global context. My analysis is not intended to be a comprehensive review of the existing scholarship about young women and activism on an international scale. Such an endeavor is an impossible task for both logistical and conceptual reasons. Using a feminist transnational approach, I have demonstrated how young women across the globe both utilize and challenge Western modes of activism. Moreover, I have illuminated how young women enact dissent against a “politics of domination” as a form of critical global citizenship that we might think of as dissident global citizenship.

Introduction

Undocumented people in the United States live intersectional lives (Collins, 1998) and when they engage in activism, their activism acts as a rotating epicenter (Montoya and Valdes, 2008) that is done in coalition with other social movements. Undocumented activism has also been inextricable to the struggle for equal educational opportunities. In the 1970s for example, Mexican families in Texas risked deportation fighting for their children's right to an education. That fight would become the landmark Supreme Court decision of Plyler v Doe (1982) which extends a free public compulsory education to students, regardless of their immigration status (Olivas, 2005).

For undocumented students, two laws passed in 1996 severely curtailed their pursuits of a higher education by disqualifying them from qualifying for in-state tuition (P.L.104-208-104th Congress: IIRAIRA, 1996) and excluding them from federal financial aid (H.R. 3734-104th Congress, PRWORA, 1996). The impact of these laws is evident when considering that out of the approximately 95,000 undocumented youth who graduate from high school yearly, only between 5 and 10% enroll in college (Zong and Batalova, 2019) with Latinxs students making up nearly 48% of undocumented college students (Feldblum et al., 2021).

Undocumented youth's fight for higher education has produced some of the most transformative and revolutionary acts of activism. Our co-author's experiences as an undocumented student activist at a predominately white institution (PWI) serve as an important contribution to the existing research literature. Daniella's story of activism is shared by way of a bate-papo~testimonio which is rooted in decolonizing methodologies. Her testimonio provides critical nuance that can generate necessary rectifying measures. Our use of testimonio is informed by Solórzano and Bernal (2001) who maintain that readers of a testimonio are put in a position akin to jury members in a courtroom. After bearing witness, they are under obligation to respond. They can choose to act on that obligation or not, but cannot ignore it.

Literature overview

In 1994, California's Prop 187 proposed denying all state-funded benefits (including public education) to undocumented people (Olivas, 2005; Villazor, 2019). Community members, many of whom were undocumented, correspondingly organized mass demonstrations in opposition. Youth's involvement in activism became stark on November 02, 1994, when approximately 10,000 students in Los Angeles walked out of school in protest (Pyle and Romero, 1994). While access to K-12 education remained protected, in 1996, two separate laws severely curtailed undocumented students' pursuits of a higher education by disqualifying them from qualifying for in-state tuition (P.L.104-208-104th Congress: IIRAIRA, 1996) and excluding them from federal financial aid (H.R. 3734-104th Congress, PRWORA, 1996).

Architecting the DREAM

In the late 1990s, civil rights associations and some state legislators coordinated efforts to promote an immigration reform law. Their public opinion research indicated that the least stigmatized immigrant group were young students who were raised in the country, identified as American, but lacked immigration status (Nicholls, 2013; Perez, 2009). Their first attempt at introducing an immigration reform bill focused on this group that they came to call Dreamers; a moniker that purposefully alluded to them as an embodiment of the country's storied meritocratic values (i.e., the American Dream). In 2001, the first DREAM Act was introduced into Congress. Had it passed, it would have allowed those eligible the ability to adjust their immigration status and become US citizens (S. 1291-107th Congress, DREAM, 2001-2).

Subsequently, civil rights associations helped form a network of local and state student groups and advocacy organizations called the "United We Dream Coalition" (Nicholls, 2013). This coalition trained youth in organizing, campaigning, and mass media communication. Undocumented youth were consulted on how to frame their personal stories as ones of assimilation, exceptionalism, and innocence whenever speaking with politicians, the public, and the media (Costanza-Chock, 2014). The network grew rapidly, particularly across university campuses in areas of the US like California, Arizona, Texas, and Chicago (Dougherty et al., 2010). As the network expanded, internal disagreement began over strategy and direction. Many felt that the focus on lobbying politicians was unproductive and that the DREAMer narrative was exclusionary of many and condemning of their parents. They were also critical of the network's leadership which was mostly non-undocumented people.

During this time, the Sensenbrenner Bill (H.R. 4437) was introduced which proposed a series of draconian efforts which included constituting undocumented people's presence in the US a felony. In 2006, mass protests against the bill began in Chicago and continued nationwide for a period of eight weeks (Pallares and Flores-González, 2010). Undocumented youth were at the center of many of the organizing efforts against H.R. 4437, which is estimated to have brought in between 1.6 and 2.2 million protesters across the United States (Fox, 2006).

Felons not families

Immigration reform was central to Barack Obama's 2008 presidential campaign. However, once elected, his administration instead dramatically increased deportations. Undocumented youth responded in a variety of ways. Groups broke off from the larger DREAM networks and abandoned the established strategy. These new groups favored highly visible acts of civil disobedience with the purpose of drawing attention to the protection of all undocumented people (Truax, 2015). This faction of activists embraced an organizational structure that allowed for more horizontal coordination among groups, rather than a traditional hierarchical model (Nicholls, 2013). They utilized emerging digital media outlets as a form of ground organizing (Seif, 2011). The message they crafted and promoted was their own: undocumented, unapologetic, and unafraid (Zimmerman, 2011). To emphasize this message they staged numerous national, state, and local protests such as long-distance walks, sit-ins, hunger strikes, rallies, and mock graduation ceremonies where they publicly proclaimed their undocumented status (Gonzales, 2008; Truax, 2015; Abrego and Negrón-Gonzales, 2020).

After mounting pressure from activists, another failed DREAM Act in 2010, and facing re-election, Obama announced the Deferred Action for Childhood Arrivals (DACA) program in 2012. DACA is not an immigration reform law in the way that the DREAM Acts would have been. It is a temporary discretion that grants recipients a valid social security number and work authorization for 2 years if they meet several very specific key requirements. The program has facilitated employment and post-secondary education for many recipients (Castrellón et al., 2017; Nienhuser et al., 2020; Olivas, 2020; Macías, 2018), but it has done little to placate activists' demands. Groups like National Immigrant Youth Alliance (NIYA) focused their activist efforts on the immigrant detention industrial complex (Truax, 2015). In 2012, NIYA members Marco Saavedra and Viridiana Martinez surrendered themselves to immigration officials in order to infiltrate the Broward County detention center to expose human rights abuses and halt deportations (Ibarra and Rivera, 2019). Afterward, Marco became part of the DREAM 9 activists who self-deported to Mexico and later presented themselves at the US border seeking asylum. This incredibly risky and highly public act was done to protest the record number of deportations and challenge Obama's position that only "felons, not families" were being deported.

Trump administration

In the United States, undocumented activism under the Trump administration remained consistent albeit under new threats. Trump's transition team projected deportations under the new administration would increase by 75% without adding personnel (Bennet, 2016). This projection alluded to ending DACA then using existing data (i.e., DACA recipients' personal information) and possibly subpoenaing school records to increase deportations.

Trump's racist-nativist political rhetoric and subsequent policies impacted negatively impacted Immigrant and Students of Color, throughout the US (Pérez Huber and Muñoz, 2021). Public schools and other institutions responded in a variety of ways, one of which was declaring themselves sanctuaries from immigration enforcement (Collet and Macías, 2021). For schools and universities, undocumented activists advocated creating sanctuary campuses which would include refusing to cooperate with subpoenas and immigration officials (Muñoz and Vigil, 2018; Allard, 2018). Educators and students were on the frontlines activists organized in various ways such as creating safe spaces, rapid response teams and other support networks in response to deportations (Crawford and Dorner, 2019). In 2019, Trump lost his presidential re-election campaign. He lost critical electoral votes in states like Arizona, Georgia, and Michigan where organizers and activists have been credited for mobilizing voters.

Undocumented activism globally

While this work is situated in the US context, it is imperative to note that immigration is a global occurrence. Displacement, changes in labor markets, climate change, political unrest, as well as the search for safety and/or increased opportunities drive people to migrate (Connor, 2016). However, increased immigration, particularly by people from the Global South immigrating to Western nations¹ has been met by increasingly draconian laws that illegalize their presence then surveil, identify, detain, and deport them (Connor, 2016; Gonzales et al., 2019).

Correspondingly, undocumented immigrants across Europe commonly experience racial aggressions, social stigma, as well as financial limitations, and governmental exclusions (Gonzales et al., 2019; Alfred, 2020; Madia, 2021). Undocumented students, in particular, face similar challenges to those in the US. Compulsory education is available to them in many European countries, but those with post-secondary aspirations are excluded from government educational subsidies and largely unable to afford the high foreign student tuition fees associated with their immigration status (Covington, 2008).

Thus, immigrant activists have organized various campaigns and tactics to assert their rights and sense of belonging across European nations (Swerts and Nicholls, 2021). In Ireland for example, the "Young, Paperless and Powerful" (YPP) campaign supports artistic outlets for undocumented youth to share their experiences and advocates for immigration reform in Ireland (Alfred, 2020). In Greece, activists occupied/squatted in an abandoned orphanage in Thessaloniki, Greece. Organizers of "Orfanotrofo" housing squat in 2015 provided meals, basic needs, and other supplies to immigrants and activists. This action was done, in part, as a response to the Greek government's hardline response to the nearly one million people seeking refuge from conflicts in Syria, Iraq, and Afghanistan (Karaliotas and Kapsali, 2021). More recently, undocumented activists held a two-month-long hunger strike across Belgium in 2021. The approximately 500-person hunger strike sought to bring attention to exploitation and exclusions they face in Belgium (Madia, 2021). Undocumented youth also wanted to draw attention to the financial unfeasibility of attending university. While these campaigns have had varying levels of success, their strengths demonstrate the power of organizing and alliance-building and the limitations signal the underlying issue of co-optation by middle-class allies (Karaliotas and Kapsali, 2021).

Methodology

A methodology takes into consideration the epistemological framing of the researcher and their relationship to the research inquiry (Fierros and Delgado Bernal, 2016). Ladson-Billings (2003) recognizes that epistemology is a person's "system of knowing" the world which is shaped by the conditions under which they live. As the authors of this work, we recognize that our ways of knowing are intrinsic to our respective mother tongues, cultural upbringing, and also experiences with immigration. Our lingua franca is English but we were raised in Mexican (Luis Fernando) and Brazilian (Daniella) households speaking Spanish and Portuguese, respectively. We grew up in mixed immigration status families but recognize important distinctions with respect to our immigration statuses. Our methodological approach reflects these rich epistemologies, which we are calling a methodology of bate-papo~testimonio.

Bate-papo and pláticas

Bate-papo is a Brazilian expression for ongoing, informal conversations shared between friends and family. The word "papo" refers to a bird's crow; while the "bate" means to strike. When chickens make noise, their throat appears to strike the inside of their neck. "Bate-papo" is the imagery of the chicken's throat movement. The expression is akin to saying, "let's get our throats moving". A bate-papo may vary from playful, as the name suggests, to solemn. Regardless of the tone, people exchange ideas, pass along

¹many of which were former colonial powers.

information, and build community. In this way, bate-papo is conceptually linked to pláticas which are also part of rich oral traditions within Latinx/Latin American cultures. Pláticas are a collaborative process of “sharing stories, building community, and acknowledging multiple realities and vulnerabilities” (Burciaga and Tavares, 2006). They take part through the “syncopated sounds of carcajadas, gritos, and, murmurings” (Chabram-Dernersesian and de la Torre, 2008). Pláticas are a space where Latinas are rightfully situated as experts embodying knowledge and producing theory about their own lived experiences (Gonzalez, 1999). The knowledge produced offers valuable insights for academic scholarship (Delgado Bernal, 1998, 2002). Fierros and Delgado Bernal (2016) outlined five principles of plática methodology. The most salient in this work are the principles that (i) draw from Chicana/Latina feminist theory and recognize (ii) situate platicadoras as co-creators/co-constructors of knowledge, (iii) solidify the connections between lived experiences and the research inquiry and (iv) underline the need for reciprocity and trust.

Nosso bate-papo centers Daniella’s experiential knowledge with undocumented activism. Its candid nature was only possible because of a friendship and trust that began when we were part of an informal student group fighting for undocumented student rights. For this work specifically, batemos um papo over six months via text message exchanges, collaborative online document editing, phone, and video calls. The prompts that shaped our conversations were rooted in Luis Fernando’s interest in learning more about Daniella’s experiences and perspectives. Our work also introduces new conceptual understandings of activism which are the product of what Latina Feminist theory recognizes as Daniella’s own articulation of a “theory in the flesh” (Moraga and Anzaldúa, 2015).

Testimonio

Nosso bate-papo served as the vehicle for Daniella’s testimonio about her different experiences with activism which may be considered this work’s findings. We chose to assign pseudonyms to the people and organizations referenced in Daniella’s testimonio to maintain their anonymity. We’re particularly mindful of protecting other undocumented immigrants mentioned in Daniella’s testimonio from having their status disclosed and exposing them to backlash from the powerful institutions and individuals cited in this testimonio.

Testimonios were born out of Latin American human rights struggles and are recognized as a verbal journey that denounces injustices and documents the experiences and acts of survival of oppressed groups (Solórzano and Bernal, 2001). Testimonios are also critical reflections of a personal experience which serve to shed light on injustices and also provide possibilities for rectification (Delgado Bernal et al., 2012). When employed by Latinas, testimonios as a methodology empowers testimonialistas to honor their complexities and reclaim their own story. The ~ (tilde) between pláticas~testimonios signifies the overarching process of reflexión—thus, the bridge between the two methodologies (Flores Carmona et al., 2018). Similarly, we embrace the bridge in nosso bate-papo~testimonio and continue the tradition of decolonizing methodologies that “teach, learn and form alliances based on our personal stories that are very much communal” (Delgado Bernal, 2009).

Positionality

I, Luis Fernando, am a first-generation US citizen who grew up in a mixed immigration status home. My family immigrated from Mexico to Southwest Texas when I was a child. Given the mixed statuses in my family, immigration was a pressing issue in my home and community. However, I have never been undocumented and thus recognize that I am the beneficiary of multiple privileges allotted to a US citizen.

I, Daniella, am a DACA recipient born in Brazil and raised in Massachusetts. As an undocumented immigrant, my life and scholarship have been directly shaped by immigration policy. The deportation protection I have as a DACA recipient enables me to disclose my status with a lesser degree of fear than I felt prior to having DACA. Both of my parents are naturalized US citizens. As a result, I feel privileged to be able to discuss my undocumented identity without putting my family at risk.

Guiding frameworks

Our work draws on two complementing frameworks to drive the discussion on undocumented activism. We rely on a conceptual framework that characterizes Black and Brown students’ activism as a spectrum of civic engagement and Critical Race Theory’s (CRT) tenet of interest convergence. These frameworks also inform our own theoretical contributions of what it means to engage in activism, advocacy, allyship and to usurp.

Activism spectrum

Logan et al.’s (2017) study on Black and Brown millennial students’ activism suggests that their characterization of activism falls within a spectrum, rather than a singular definition. That spectrum ranges from “existence as resistance” on one end and “activism consumes life” on the other extreme. “Existence as resistance” is defined as the mere act of existing as a marginalized person within a hostile environment. From this perspective, a student of Color attending a PWI engages in activism simply by virtue of their presence. Strategy and intentionality are not required. Toward the opposite end of the spectrum is “frontline activism” which the authors describe as activism with more intentionality and greater personal sacrifice. Frontline activists are strategic about their actions and

take on leadership roles in the various efforts to fight injustices experienced by their community. At the very end of the spectrum is “activism consumes life” which is a full-time commitment to visibly organizing and advocating against injustices. The factor that sets this form of activism apart from “frontline activism” is the recognition that only a few people have the time and resources available to have activism be their primary role in life. Logan et al. (2017) then posit that different students identify singularly within one of those definitions in the spectrum.

Critical Race Theory

Critical Race Theory (CRT) is an intellectual movement that recognizes People of Color’s experiences with racism and other forms of subordination as units of analysis to understand inequalities in the United States (Solorzano, 1997). One of CRT’s main tenets is interest convergence which proposes that there are moments when the interest of the dominant group temporarily aligns with that of minority groups that then allows for some measure of social change. Interest Convergence outlines that the systematically privileged dominant group will support justice only to the extent that it does not result in the forfeiture of their own power (Bell, 1980). Thus, seemingly opposing interests converge but the specific interest of a dominant group is always furthered.

Activism, advocacy, allyship, usurping

Rooted in Daniella’s experience with activism, we theorize what it means to engage in activism, advocacy, allyship, and to usurp. Different from Logan et al. (2017) we do not conceptualize these as categories that are static, hierarchical, or on a spectrum. Rather, they are actions that people take in relation to their position within certain social movements.

We posit that activism is an effort to organize and/or increase consciousness by someone who is directly impacted by the injustice(s) being fought. These actions may include leading a roundtable discussion, participating in a public protest, or attending support groups to interact with fellow members of a marginalized group. Critical to activism is some measure of personal sacrifice. Sacrifice may be understood as sharing vulnerable aspects of one’s identity or dedicating time and resources. A person’s wellbeing, relationships, and/or professional opportunities may also be a form of sacrifice.

Advocacy differs from activism in that advocacy is to take actions in support of activism. People who enact advocacy are not directly impacted by the injustice(s) being fought. Thus, they may leverage their privilege(s) to advance activism efforts. Advocacy may include contributing personal, professional resources or intervening in moments or hostile environments that are not safe for those directly impacted.

Allyship is to demonstrate support toward those who are facing injustice(s) without leveraging any privileges or contributing resources. Demonstrations of support in allyship may include nominal public donations, participating in protests, signing petitions and/or asking elected officials to support certain legislation. Allyship differs slightly from virtue signaling. While both are largely symbolic, we do not propose that allyship is done in order to garner praise or acknowledge one’s righteousness. A person may not have the knowledge, availability, or interest to engage in advocacy and thus their actions are limited to allyship.

Conversely, we posit that to usurp is in fact to take actions that garner praise and advance personal and professional ambitions at the expense of those directly impacted by the injustice(s). Usurping is not sacrifice nor leveraging privilege. There is a performative element of public support and/or labor taken in organizing efforts (i.e., rallies, petitions) yet those actions are taken for self-benefit. Usurping may be done willfully or unknowingly. Nevertheless, this form of co-optation is harmful because it exploits marginalized people, erases their efforts, and undermines their agency and purpose for activism.

Daniella’s testimonio

When I, Daniella, was in my senior year of high school, I became a DACA recipient which made it easier for me to apply to multiple colleges around the country. I was accepted to several universities but ultimately enrolled at Elm State University (ESU) because it was the only economically feasible option. All other colleges that accepted me flagged my application as ineligible for any financial aid due to my undocumented status. ESU, however, awarded me with a merit-based scholarship that was renewable for four years. I later learned that this scholarship award was only possible due to an administrative misstep that allowed my undocumented status to go undetected. This oversight, while financially beneficial, incentivized me to hide my status. I navigated my time in college in constant fear that ESU would find out about my status and revoke my scholarships. Each of the following vignettes provides a snapshot of my experiences as a college student which will subsequently be discussed in conjunction with the frameworks to understand them as activism.

Do you think undocumented students belong in college?

I was a sophomore at ESU when I first volunteered to help at the university’s Latinx Success Conference, which is geared toward encouraging high school students to pursue college. My assigned role for the event was minimal: arrange chairs and hand out lunch bags. The keynote speaker was an academic, a Latina who focused her speech on the dismal statistics surrounding high school and college graduation rates for Latinx students. Her speech felt discouraging, the opposite of what the event was intended to do. After the keynote, a panel of Latinx ESU students took the stage to answer questions from the audience. Eduarda, a graduate student, and

staff member, moderated the event, handing the microphone to students in the audience asking questions. As the event came to an end, the final question came from a high school teacher who asked the panelists “Do you think undocumented students belong in college?” I gathered that he asked the question because there were undocumented high school students in the room, who probably did not feel comfortable asking that question themselves. I watched the panelists awkwardly answer that they thought anyone could belong in college but that they were not undocumented. Their answers were vague. They stammered and shifted in their seats, noticeably uncomfortable. I empathized with undocumented students in the audience who were listening to these unhelpful answers, especially following the keynote speaker’s grim portrayal of Latinx student success. If I was hearing this as a high school student I would have felt left out and discouraged. My heart started to race as I looked around in disbelief. I felt an overwhelming sense of duty at that moment, almost like a rush. I then went up to the stage and asked Eduarda if I could speak. For the first time in my life, I shared publicly that I was undocumented. I took the microphone and said emphatically that we not only belonged in college but that we could thrive in higher education. I told the room that I was living my dream college experience: I had close friends, a prestigious, well-paid internship, and good grades. If I could do it, I felt that other undocumented students should be encouraged to do the same. I left the stage feeling accomplished and uncertain. I was surprised by my own courage to share my status but unsure if my approach had been effective in countering all of the negativity and uncertainty that lead up to that question.

Hours after the event, Eduarda messaged me and told me that a high school student in that room who was a DACA recipient came up to her crying afterward because I made her believe that she could go to college. This felt incredibly empowering and rewarding. The pride and joy inside me was nearly overflowing, but I felt that I had to keep it inside because I was not ready for anyone else to know my status. After the conference, Eduarda and I developed a close friendship. She would later introduce me to a group of undocumented ESU students.

Hope, fear, and action

Soon after the conference, I began meeting regularly with the other undocumented students on campus to socialize and build community. We playfully called ourselves the Undocumented Student Alliance (USA). We became close friends and co-constructed a space where we were able to discuss our undocumented experiences candidly with each other. We built community, and at times organized, but we were always strategic and reflective of each other’s comfort levels. We grew closer at the same time that the Donald Trump campaign was garnering more attention. It was a topic we often discussed because of the many anti-immigrant promises he had made. At first his candidacy seemed impossible, but we could already feel the damage his rhetoric was causing. There were Trump signs posted on dorm windows all over ESU, and incidents of anti-immigrant street harassment reminded us that we were not safe on our own campus. At USA meetings, we brainstormed both how to prepare for either outcome of the election, but specifically what we would do if Trump was elected.

Two weeks before the November 2016 election, Astrid, a local public radio reporter, reached out to some of us at USA. She asked us if we were interested in being interviewed about the impact of the election on the lives of undocumented immigrants. I was hesitant to participate because of the wide audience this interview would reach. I would be outing my status to listeners who, if I lost my DACA protections, as Trump had promised, could identify me for deportation. Also, one of my classmates or professors could hear the story and confront me about it and jeopardize my funding at the university. Despite these risks, I decided to go forward with the interview because my USA friends trusted the reporter who seemed to genuinely believe this story might inform voters about the need for immigration reform. Since I cannot vote, I viewed the interview as my way of participating in the election, my civic duty. I wanted there to be a historical record of my involvement in that unprecedented election and so I shared my full name and university affiliation in the interview.

On election day, I felt hopeful and confident that voters would reject the Trump agenda and elect the first woman president of the United States. I spent the day in anticipation of a historic outcome. I watched the election results come in over dinner with a family I met while canvassing that weekend. Once it seemed inevitable that Trump would win, they drove me home and I held back tears until I got inside the safety of my bedroom. Minutes after the television networks called the election for Trump, I received a Facebook message from two self-proclaimed organizers who found my name through the radio interview: Michael and Andrew, both white, U.S.-born citizens. They urged me to meet that night to plan an anti-Trump demonstration the next day. Their message read “we need to have an emergency meeting with undocumented people”. I shared with them that I was exhausted and was going to be with my USA friends to process the election results but that we could connect the following day to organize. They replied “don’t panic! Where are you meeting right now? I have some people that would like to go”. They were forceful and persistent so we met at around 1am at a USA friend’s house.

I introduced them to the other members, primarily the other women. Michael and Andrew immediately began talking about their very specific vision for how the rally would unfold. We would share our immigrant stories with the crowd and the media. Specifically, they wanted us to highlight our economic contributions to the country and our fear that Trump would enact his anti-immigrant campaign promises. They leveraged their network and circulated the rally invitation to a wide audience and ensured that there were plenty of media outlets there. The next night, around 200 people gathered near city hall to attend the rally. Michael and Andrew led the event and dictated the lineup of speakers who shared their reactions to the election. I did not receive media training nor had I been coached on how to protect my identity when speaking to random reporters. Nevertheless, when Andrew handed me the megaphone, it felt liberating to shout my immigrant story to a massive crowd. After the rally, Michael and Andrew praised me for moving the crowd to tears and called the event a success.

Immediately after that rally, Michael and Andrew recruited my undocumented peers and I for other events and demonstrations. It gradually became apparent that in community planning meetings for those events, the organizers (a majority white crowd) outnumbered and spoke over those of us in attendance who were more directly impacted by Trump's proposals and rhetoric. The resulting events were not led by us. We, mostly undocumented women, were singularly expected to attend events and enact an emotional performance highlighting our fears and vulnerability in a way that would fire people up at the expense of our safety. At the last event, I attended with them, Michael and Andrew took me to a city council meeting. They wanted to petition the council to draft protections for the city's immigrants during the Trump administration. They had their talking points prepared and my input was not valued. I was simply tasked with eliciting sympathy from the council members.

I trust that you will not post that anywhere

Months into the Trump presidency, I was feeling hopeless and scared. I had not seen any progress from the public rallies and events that I was a part of with Michael and Andrew. Thus, I shifted focus. I felt that seeking some sort of commitment from ESU to protect undocumented students seemed more viable at the time rather than hoping for larger scale political change. The radio interview, exclusively featuring four undocumented students from ESU, increased our visibility on campus. My undocumented student peers and I had been meeting on a more regular basis and focused on developing a list of demands for ESU which included revamping the admissions process so that undocumented students were not considered international students and making all eligible scholarships publicly available to undocumented students. Dr. West, a senior university official, agreed to meet with us and discuss these and other demands. Ysabel, an administrator who was positioned by the university as the de-facto contact for undocumented students, facilitated the meeting. She coached us on using language she thought would be well received by Dr. West.

Dr. West was always very measured and soft spoken, at times almost robotic. During the meeting, we expressed to him our fears that DACA would be rescinded and asked for his commitment that ESU would still honor in-state tuition rates and refuse to share our information with immigration authorities if that were the case. He responded diplomatically but was noncommittal. He said that he was open to having some privately funded merit-based scholarships available to undocumented students. However, he made it clear that the university could not make this consideration public or state it on their website because the board of trustees would not be supportive of it. When we discussed our need for having a staff member dedicated exclusively to serve as the main resource on campus for undocumented students, he surprisingly agreed. Dr. West never said "no" to any of our demands. He seemed receptive to everything. Ysabel encouraged us to see his response as "a win", even though it was unclear which of our demands would be directly met. At the close of the last meeting, she suggested we take a picture with him. Dr. West smiled brightly for the photograph but immediately after it said "I trust that you will not post that anywhere, right?"

That semester, three out of the six USA students at that meeting graduated and, as the group got smaller, the pressure being applied on the administration subsided. Ultimately, our specific personnel recommendations were overlooked as was the proposed title for this position. Rather than what we had petitioned for, ESU added the title "DACA Liaison" to an unrelated position that was already in the final stages of being filled in the Office of Student Affairs. The person that was hired did not have any professional or scholarly expertise on undocumented student support. A year after their hire, the Director of the Multicultural Center, who also lacks any formal training on undocumented student support, relieved this person of their DACA liaison duties and subsumed the role himself. As for Dr. West, he has since left ESU for an even more prominent role at one of the largest public university systems in the country; ironically one that has publicly marketed itself as a champion of undocumented students.

One last push ... and shove

Entering my final semester at ESU, commencement was constantly on my mind. I kept picturing my family at the university's stadium celebrating my achievements. My vision of that moment was coupled with concern that some of my family members would not be able to fully participate in the commencement ceremony because English is not their dominant language. I also realized that for many students (both domestic and global), commencement would be their family's first time on campus. Given ESU's prestige and global recognition, I figured they would have the resources needed to provide multilingual services for their commencement.

Five months prior to commencement, I contacted the Office of Special Events requesting the university to provide multilingual translations at commencement, especially in the languages most prominent among the student body. I did not receive a reply, but I kept checking in periodically. Four months after my initial email, an administrator in the Office of Special Events responded that a multilingual service would not be viable. The first excuse she stated was that no other university had ever done this. The second excuse was that there would be 88 countries represented at commencement and thus they could not guarantee translation for all the languages represented. Further, the administrator argued that by refusing to provide translation the school was being "mindful of our diverse student body" and that providing access to some, but not all, would be a "disservice to many."

Feeling frustrated, I reached out to Astrid, the reporter, and asked for her help doing a story on the university's response to my request. She referred me to her colleague, who agreed to not only interview me for a story but also reach out to the university to ask about this. In the meantime, I reached out to other peers including Eduarda and Luis Fernando, both of whom had some experience with professional translation and also had family members who would benefit from having a multilingual ceremony. We worked together to draft email responses challenging the administrator's response. We identified which languages we had been asking for based on our understanding of the languages represented in the local community and within the student body. The Office of Special

events finally agreed to a meeting with those of us who sent the email. During that meeting, we responded to their assertion that such an undertaking was impossible by presenting the research we had done regarding the audio technology needed and all of the logistical considerations. It was astounding to me that us students could research and develop a detailed plan to have a multilingual commencement, while the university, with all its resources, maintained that it was not possible. This meeting took place only two weeks before commencement, but I was not going to let the university use time as an excuse because I had first engaged them on the topic months prior. We were confident and assertive while speaking with the administrator and I made sure to point out that there would be a news story about the university's response to our demands.

After much effort on our parts, five months after my original email, the university agreed to provide live translation over a phone hotline in Spanish, Mandarin, Portuguese and Somali. The news story that ran soon after was first published under the title "After A Push—And Shove—From Students, University Will Offer Commencement Translations." A couple of days after the publication, the headline was changed to remove the words "And Shove." Later, during an event at commencement week, the Dean of Students said to families in attendance that the university was offering live translation at commencement for the first time in its 147-year history. She signaled that this was "a sign of the university's commitment to diversity." I was furious. There was no mention of the fact that it was a student-led effort and that we lobbied the university for months in order to make it happen. On commencement day, multiple family members of mine used the translation service in Portuguese. For us, it was a huge success and I cannot picture my commencement ceremony without it. Despite their proclaimed commitment to diversity, ESU has not offered multilingual translation services at commencement ceremonies since then.

Beyond ESU

After graduation, I leveraged what I learned at ESU and continued engaging in activism at my place of employment, in my community, and also at the national level. While I had some success advocating for my then employer to support DACA-recipient employees, the lack of national legislative progress pushed me to a state of hopelessness. During this time, I suffered a severe depressive episode and received intensive medical treatment for three months. Consequently, I retreated from activism for about a year and half. Currently, I am attending graduate school where I am focusing my emerging scholarship on the educational journeys of my undocumented community.

Analysis

We situate Daniella's testimonio in conversation with [Logan et al.'s \(2017\)](#) spectrum of civic engagement to examine the different types of activism she took on as an undocumented student. Equally, we identify and discuss our conceptualizations of activism, advocacy, allyship, and usurping throughout Daniella's experiences. Incorporation of CRT's interest convergence is key in our analysis because it provides a historical understanding of how institutions respond when the status quo is challenged.

Existence as resistance: origins of an activist

[Logan et al. \(2017\)](#) state that student activism is often a response to hostility experienced throughout the campus climate. Hostility can take many forms, including erasure. The erasure of undocumented student experiences at the Latinx Success Conference was stark. Latinxs make up approximately 48% of undocumented college students in the US ([Feldblum et al., 2021](#)), yet there were no events directly related to this prominent student population at the conference. The only time it was mentioned was toward the end of the ESU student panel when a teacher in the audience asked about it, seemingly, as a proxy question for his students in attendance. Even then, the student panel failed to answer the question. Daniella responded to this erasure by openly sharing her accomplishments as an undocumented college student. By sharing her success, she demonstrated to the audience (undocumented students in particular) that it was possible to do well at a prominent institution. Her actions countered the erasure at the event, the pessimism of its keynote speaker, and the apathy expressed by the student panel. Daniella's actions may be understood as "existence as resistance" because it affirmed the ability of undocumented students to be on ESU's campus. According to [Logan et al. \(2017\)](#), the very presence of marginalized people within a hostile context can be conceptualized as activism. This form of activism does not require intentionality or strategy. Daniella did not attend the event with plans of sharing her status. She felt compelled to act and risked the security of keeping her status a secret. Daniella points to her actions at the conference as the birth of her activism.

The high school teacher who prompted the question also played an important role. His proxy question introduced the topic of undocumented students in an event that had erased their presence. We consider this teacher's actions as that of an advocate. He wielded his relative privilege in that situation to speak up in support of undocumented students.

Sacrifice in frontline activism

USA students publicly disclosing status was a monumental step and a critical form of activism. By participating in the radio interview, they all sacrificed their safety (i.e., anonymity) in an increasingly anti-immigrant climate. In Daniella's case, sacrificing her anonymity also meant risking that administrators or staff at ESU would find out about her status and possibly revoke her

scholarships. Her willingness to sacrifice her financial support is emblematic of our position that sacrifice is intrinsic to activism. While not every member of the USA group chose to participate in the interview or later meet with Dr. West, we still recognize them as engaging in the “existence as resistance” form of activism.

Daniella felt a greater sense of protection from deportation for her (via DACA) and her family (via their US citizenship) in comparison to some of her USA peers. This protection coupled with the belief that she had a responsibility to act compelled her to do the radio interview and thus engage in “frontline activism” which is higher visibility and involves a greater degree of sacrifice and discomfort.

Usurping the moment and the movement

The radio interview exposed Daniella and others at USA to another risk: that of co-optation. Michael and Andrew were not members of USA, nor had they worked previously with the group in any capacity. Rather, they sought out Daniella immediately after the election outcome, prompted an “emergency meeting”, and invited themselves to where USA was gathering to recruit them to take part in a public rally. We find their approach inconsiderate and inappropriate. More specific to our analysis, their actions are emblematically opportunistic and a usurpation. They contacted Daniella during an emotional time fraught with uncertainty and disregarded her response under the pretext of having the duty to act immediately. Similarly, they neglected the group’s need to process their emotions and capitalized on that vulnerability to recruit speakers for their upcoming event; they usurped the moment.

At all subsequent planning events, Michael and Andrew demonstrated their unwillingness to share their positions of power with the USA members. They dictated what aspects of the USA members’ stories would be shared and overlooked suggestions from the undocumented activists on when, how, and where to mobilize. They pushed Daniella and her undocumented peers to be in constantly visible and high commitment roles, with no regard to the disruption the election results had brought to their lives. At public events, Michael and Andrew treated Daniella’s personal story as a commodity to be shared with anyone who wanted something to rally behind in their anti-Trump demonstrations. The two self-proclaimed organizers, however, never discussed any security or support services in the event of threats, harassment, or detention. They conveniently recognized the human appeal in her story but not the need to protect her humanity.

We now recognize Michael and Andrew’s ability to dedicate themselves full time to organizing is not indicative of their investment in undocumented people’s rights. Rather, it demonstrates the multiple privileges that they channeled for self-benefit. These privileges become starker when juxtaposing their actions with Daniella’s involvement and the risks associated with it. Daniella perceived her involvement as a matter of survival while Michael at one point bolstered that he had different sources of funding to support his organizing efforts.

During this time, Michael and Andrew fielded numerous media interviews which helped them grow their network and influence as organizers. They have since appeared on global news outlets and are now public figures in academia and in the nonprofit sector, respectively. Paradoxically, Daniella could not so much as highlight her involvement in the rallies and community meetings on her résumé because doing so would signal to possible employers that she is undocumented. In this way, Michael and Andrew also usurped any professional possibilities that could come from the leadership experiences of organizing. This dynamic is not exclusive to undocumented activism in US. As [Karaliotas and Kapsali \(2021\)](#) point out uneven power relations within immigrant rights movements globally often result in privileged allies excluding and speaking on behalf of the marginalized.

Daniella’s willingness to openly advocate for herself and her community was essential to the success of the rallies and community meetings but was never credited. Michael and Andrew had the opportunity to provide support and mentorship to undocumented activists as well as the privilege and resources to become effective advocates, but their actions demonstrate an unwillingness to channel those privileges for the benefit of others. Instead, they benefited from the sacrifice of activists and usurped any and all prestige that came as a result of their shared organizing efforts.

Perceiving “wins”

The radio interview with USA students was pivotal; it publicly put the onus on ESU to recognize its undocumented students and their fears if Trump was elected. Students seized this opportunity and secured a meeting with Dr. West to discuss the university’s role in supporting them and other undocumented students. Ysabel was instrumental, but not indispensable, in creating that meeting. Once at the meeting, her actions shifted to passive. When Dr. West evaded commitments or shifted the conversation, she remained quiet. She did not interject, advocate for a point the group was making, or redirect Dr. West back to the discussion. The extent of her contributions at the meeting was the prompting for a group picture. In this way, Ysabel’s actions are allyship. She publicly supported USA’s cause, had a minor level of involvement, but remained quiet at pivotal moments. Even though she urged the group to consider the meeting as “a win”, she did not channel any of her privileges to advocate for change.

Our analysis also maintains that ESU’s proposed support of undocumented students is a clear example of interest convergence. The group championed public institutional support for all undocumented students. Dr. West instead ceded to discreetly promote information about existing scholarships eligible to DACA students and create a largely symbolic DACA liaison position. ESU’s concessions yielded a measure of change but they were not systemic and largely served the university and Dr. West’s public image. The critical shortcomings with the concessions are that they exclude undocumented students who are ineligible for DACA and/or

failed to commit support if DACA status was rescinded. By not making any changes public, only students who know Ysabel (or any of the other few knowledgeable staff) were privy to that information. In this way, they have a hidden prerequisite for eligibility.

The DACA liaison position is characteristic of interest convergence. The title itself situates DACA students outside of the university and thus the need for a liaison. The position is also largely symbolic as evidenced by the lack of rigor in properly staffing it and the limited responsibilities it carried. In 2017, when universities nationwide were demonstrating their support for undocumented students as a response to the Trump administration's termination of DACA, ESU published a vague statement referencing the position as evidence of the university's support for DACA students but did not include eligible scholarships or other concrete supports.

Interpreting signs of the university's commitment to diversity

ESU's response to a multilingual commencement is another telling example of interest convergence. ESU agreed to the translation services Daniella proposed only because it could benefit the university's public image of inclusion and diversity. Months after Daniella's inquiry was initially ignored, the administration replied to her request as a "disservice to many" and rejected it. It was not until the reporter doing the news story reached out to ESU administrators for comment that they were open to discussion. We gather that the news story created public pressure which then facilitated the meeting with students. In this regard, we consider Astrid's actions to be advocacy because she leveraged some of her professional resources to assist Daniella. By connecting her to the appropriate reporter to pitch the story of the multilingual commencement, Astrid intentionally channeled her power in support of activism.

By the time the meeting with students was agreed to, all of the labor had already been completed. Daniella and her peers presented the results of their research and strategic plan. ESU did not have to dedicate any resources. Administrators simply had to agree to implement the plan. ESU then swiftly claimed ownership of the idea. The Dean of Students' public statement that this was a "sign of the university's commitment to diversity" is evidence of how interests converged only to benefit the university.

The legacy of progress

Regardless of setbacks, instances of usurping, and interest convergence, Daniella and the USA group's efforts have led to significant measures of change. The USA's news story raised critical awareness about the issues undocumented students face. They then leveraged that awareness into a meeting with Dr. West which created the DACA liaison position. Albeit a mostly symbolic position, it may serve as a starting point for undocumented applicants at ESU to gather information about resources. With institutional support, the position itself can grow into a viable asset for undocumented students at ESU.

The pressure for institutional support continues. For example, while writing this article, we learned that a new undocumented student group has formed at ESU. The Coalition of Undocumented and Allied Students (CUAS) is an officially recognized student group at the university. This designation grants them access to institutional resources which they can then utilize to promote initiatives and other support that was unavailable to the USA group. The group's title articulates its commitment to undocumented students at large (not exclusively DACA) which is indicative of progress. Lastly, while ESU has failed to continue offering multilingual ceremonies, they cannot deny their ability to have them. Anyone who wishes to advocate for them in the future can readily find the history of it being done at ESU. The ability to reference a change in the status quo is important when encountering institutions who resist change.

Conclusion

We conclude by offering ways the reader can act after bearing witness to Daniella's testimonio. People who have the desire to be involved in social causes should be mindful of the stories and contributions of those directly impacted by the injustices being fought. Self-awareness and critical reflection are paramount in preventing the passion felt toward a cause from being distorted into thinking of one's self as a savior to others.

For marginalized students feeling uneasy about engaging in public activism, remember that your presence in exclusionary institutions is contributing to changing the status quo. We encourage undocumented youth, in particular, to recognize themselves as powerful, knowledgeable, and in control of how they choose to engage in activism. Also, be mindful of how common usurping occurs and protect yourself by standing firm in your boundaries and convictions.

We encourage educators especially to channel personal privileges and institutional power in support of undocumented students. Educators are uniquely situated to be powerful advocates that can use their access to administrators, faculty, and staff to relay concerns and/or advocate faithfully on students' behalf. They can also mentor students and help them cultivate skills that they can then expand on in their roles as activists. While the actions of allies can be beneficial to social justice movements, our analysis demonstrates that advocates are far more impactful. When deliberating one's role in fighting against injustices, perhaps the great Brazilian pedagogue, Paulo Freire, stated it best "Liberation is a praxis: the action and reflection of men and women upon their world in order to transform it."

On Friday, May 11, 1984, some 1350 members of the Toronto Teachers' Federation gathered to decide who their next president would be. As incumbent Jack McFadyen and contender Clem Marshall gave their speeches, one issue separating the candidates took center stage: heritage-language classes in the Toronto Board of Education, in particular the Board's plans to expand the number of elementary schools that offered such classes during the school day. Heritage-language (HL) classes were designed to teach languages such as Cantonese, Greek, Gujarati, Italian, Portuguese, Spanish, and Ukrainian, languages all widely spoken in Toronto. The provincial policy authorizing these classes allowed for programs to be held after school, on weekends, or during the school day by extending the timetable by 30 min. It was this latter option that had become so controversial; indeed, at the time of this meeting, the union was already three months into a work-to-rule job action to protest daytime HL classes.

At the meeting, McFadyen promised to toughen the union's objection to daytime HL classes, to “bursts of cheers and applause” from his audience (Brown, 1984c, p. A1). Not only would this issue be the sole non-monetary question the union would raise in forthcoming contract negotiations, he noted. But also, McFadyen stressed that by November 1984, the union would be in a legal position to go on strike to force an end to daytime HL classes. Had it occurred, this strike would have been the union's first. “We're sick of teacher bashers who say teachers are racist,” McFadyen argued. “We're not fighting heritage languages—we're fighting the fact the board slapped this on us without negotiating” (p. A1).

For his part, Marshall opposed both the on-going job action and threats of a strike. Born in Guyana and now a teacher of French as a second language, Marshall rooted his argument in his own lived experiences:

As one who has been in the so-called [multicultural] melting pot, I can tell you that melting pot can get too hot sometimes and a few of us have got burned. We've got to consider the heritage program in light of the greater good it provides.

Brown (1984c, p. A7; inserted word in the original).

Marshall argued daytime HL classes are “worth fighting for—not against—because it helps immigrant children gain self-esteem” (p. A7). For him, the job action and strike were bound to lose, because “parents are no longer behind us. We have lost them as allies with our behaviour” (p. A7). His comments received “sparse” applause. Indeed, he lost the election that night with 147 votes against McFadyen's 1368 (p. A7).

How is it that a modest program to support heritage languages would become the central issue animating a union election, even potentially triggering the union's first ever work stoppage? To what extent were McFadyen's claims accurate? Was the TTF only challenging a specific model of HL classes, and not the very idea of HL education itself? Had the Toronto Board of Education really just “slapped” this model on them without negotiations? Perhaps most complicated of all, were their protests evidence of racism? At first glance, these questions may appear too focused on a distant union scuffle from almost 40 years ago. By sitting with these questions, however, we instead see how they reveal fundamental dynamics about race/racism, language, and legitimacy that continue to shape school life in Toronto. Which languages—better asked, *whose* languages—belong in school? In which spaces, at what times, and to what ends? And perhaps most important: *who gets to decide*?

In this article, I analyze two distinct moments in the TTF's interventions around these questions. The first of these precedes the heated meeting described above by a decade, as the Board had just begun to study and take action around the gap between the Anglo

dominance of school culture and the curriculum, and the reality of racial and linguistic diversity among its students. As we will see, at that time the TTF stood firmly on the side of bilingual education models that had emerged in North America. Over the next decade, the Board would continue studying this issue, and the province itself would intervene in 1977 with its *Heritage Languages Program* policy authorizing HL classes. However, once actual HL programs existed, the TTF took radically different actions—reflected in John McFadyen’s words above and the “bursts of cheers and applause” from his union siblings. This time, teachers closed ranks and challenged the legitimacy of “outsiders” in determining what happens in Toronto schools. As the opening description suggests, this put teachers—who in the early 1980s were almost exclusively white and Anglophone—squarely at odds with demands made by racialized and multilingual parents and other community members. I analyze these contradictions so as to identify lessons from this conflict that might inform current efforts of the TTF’s successor, the Elementary Teachers of Toronto, to combat systemic racism in Toronto schools.

Theoretical and methodological framing

This paper tells one story and aims to connect it to larger questions of teacher-union activism to challenge systemic racism, both within its ranks as well as in schools. The paper is part of a larger project, funded by the Social Sciences and Humanities Research Council of Canada, that examines heritage-language policies as sites for regulating linguistic and racial difference in Canadian schools. The study draws on materialist, anti-racist (Flores and Chaparro, 2018) and political-economic (Bale, 2015) approaches to theorizing language-education policies. The global economic crisis in 2008 forced applied linguistics as a field to explore notions of class in the study of language (e.g., Block, 2014; Heller and Duchêne, 2012; Holborow, 2015). This so-called material turn has rekindled debate about the relationship between class and race as analytical categories, and how language interacts with class and race in lived experience. Following Anyon (2005), Flores and Chapparo (2018) proposed a materialist, anti-racist approach that is both historical and intersectional. This approach starts with the historical conditions that produce a given policy as a putative solution to a perceived social problem. Furthermore, their approach assumes that language-education policies only have meaning in relation to other policies related to immigration, housing, health, employment, etc. The political-economic approach I have developed (Bale, 2015, 2016) understands language-education policies as more than just ideological reflections of an underlying social order; rather, they also serve as venues in which race and class co-construct that social order in the first place. This framework contrasts with the historical-structural approach (Tollefson, 1991) used in most historical inquiry into language policy, which typically frames language policies as top-down mechanisms (Shohamy, 2006) that elites use to control society. Instead, a political-economic approach is analytically more open: it reveals how language-education policies can function both as tools for imposing a linguistic or racial order, and also as vehicles for contesting that order (see Bale, 2016).

The larger project adopts raciolinguistic perspectives (Flores and Rosa, 2015; Rosa and Flores, 2017) to theorize the relationship between language and race/racism. Raciolinguistics frames language and race as ideological categories that interact to structure society and maintain social inequalities. This perspective clarifies how systemic racism and (settler-)colonialism are constituent elements in co-constructing global capitalism. This framework reveals how contemporary language ideologies and language practices intersect with racism and colonialism in ways that often seem “natural” to us. That is, language, racism, and colonialism collaborate to organize and justify the unequal distribution of resources in society (Flores and McCauliffe, 2020). Flores (2016, 2019) has applied raciolinguistics to explore the continuity of *anti-Latinx* racism within bilingual-education programs in the United States, despite the liberationist social movements of Puerto Rican and Chicana activists in the 1960s–1970s that led to bilingual-education rights in the first place. In the project informing this paper, I use raciolinguistic analysis to explore a similar contradiction in Canada: how do we account for the *subordination* of the very language-education policies that were ostensibly designed to *support* the learning of minoritized and racialized languages?

The study is designed as a policy genealogy (Haque, 2019; Gale, 2001). Unlike traditional approaches to history, which link a present-day phenomenon to its origins in the past or view the present as the result of continuous development, genealogies instead focus on discontinuity (Gale, 2001). As Garland (2014) has described, genealogical research proceeds by “trac[ing] the erratic and discontinuous process whereby the past became the present: an often aleatory path of descent and emergence that suggests the contingency of the present and the openness of the future” (p. 372). By focusing on discontinuity, rather than seeking a linear progression to history, genealogical analysis assumes the *openness of history*. No matter how enduring they may appear, the structures and ideologies we live with today are the result of past conflict (Tamboukou, 1999). In this way, genealogical study of the past is a kind of “effective history” in the Foucauldian sense in two ways: (1) it reveals the power relations upon which the present relies, and the contingent, historically situated processes that became our present; and (2) it challenges us to think and act differently about the present (Fendler, 2008)—in this case, about racial and linguistic difference in schools.

Historical and policy context

The emergence of heritage languages as a new social “problem”

The Canadian government introduced the Official Languages Act (OLA) in 1969 and the Multiculturalism Policy in 1971. As Haque (2012) argued in her ground-breaking study of the Royal Commission on Bilingualism and Biculturalism (1963–69) that led to these two policies, official bilingualism was intended to resolve a fundamental contradiction underlying the Canadian state, by

reorganizing its white-settler identity to include both Anglophone and Francophone settlers on more equal terms. At the same time, official bilingualism antagonized another central contradiction underlying the Canadian state: both through the workings of the Royal Commission and in its central policy outcomes, official status for First Nations, Métis, and Inuit peoples and for non-Anglo, non-French immigrant communities was denied. Pierre Trudeau attempted to resolve this contradiction by proposing *multiculturalism within a bilingual framework*, that is, by allowing Indigenous peoples and immigrants to sustain their *culture* while denying them formal *language* rights. Yet, by elevating only two white-settler languages, official bilingualism formalized the hierarchy of minoritized and racialized languages that had long existed in the Canadian state (Haque, 2012; Haque and Patrick, 2015).

Within this context, *heritage languages* emerged as a new social problem recognizable to Canadians. The federal government's policies on multiculturalism and official bilingualism had the contradictory effect of raising expectations among Indigenous and immigrant communities for linguistic and cultural rights of their own, while simultaneously conferring official status on only two white-settler languages. At the grassroots level, various Indigenous, language-minoritized, and racialized communities pressured boards and ministries to transform curricula to better fit the linguistic and cultural reality of Canadian schools (see Wong and Guo, 2015). As one indication of this activity, HL education policies began to appear across the Canadian state: in Alberta in 1971, Ontario and Quebec in 1977, Saskatchewan in 1978, and Manitoba in 1979 (Cummins, 1983; Cummins and Danesi, 1990). These policies represented the provinces' first efforts to reconcile the reality of multilingual schools with an officially bilingual Canada. That is, HL policies sat—and remain—squarely at the heart of the contradiction between official bilingualism as an *imagined ideal* for Canadian national identity, and the *lived realities* of multilingual, racialized students in Canadian schools.

Despite their obvious significance, these policies have largely been ignored by scholars. The few exceptions include Cummins (1983) and Cummins and Danesi (1990), which provided a national overview, while Tavares (2000) analyzed the shift in the ideological framing of HL programs in Western Canada in the 1990s. In Ontario, besides the other publications that have emerged from this project (Bale, 2019; Bale and Kawaguchi, 2020; Kim et al., 2020), there exist only one dissertation (Berryman, 1986), one personal reflection (Wright, 1997), and one narrative inquiry involving HL instructors (Feuerverger, 1997). Otherwise, Ontario's HL policy and the programs it supported, when mentioned at all, are minor characters in larger stories about migration and multiculturalism (e.g., Gidney, 1999; Masemann, 1984; McCaskell, 2005; Vipond, 2017).

Early experiments in Toronto and new policies in Ontario

As indicated in Table 1, there was a great deal of experimentation in the 1970s involving linguistically- and culturally-relevant programming in Ontario generally and in Toronto specifically (Jean-Pierre and Nunes, 2015). This included private heritage-language classes established by various immigrant communities (Cummins, 1983) and Black Cultural Heritage programs designed to counter the racism that Black youth experienced at school (Bramble, 2000). The Toronto Board of Education also experimented with bilingual-education programs, and from 1974 to 82 struck three separate task forces to study the relationship between language, culture, race, and education (about which, more below). Although each of these “work groups” framed its inquiry differently—first by focusing on multiculturalism, then on racism as *race relations*, and finally on language—they all understood that policy and curriculum change must start from understanding the interconnections among language, race and culture.

Within the midst of this experimentation and sustained inquiry at the Board, the Ontario government initiated its *Heritage Languages Program* (HLP) in 1977. The government surprised many by proposing the policy in March, ahead of provincial elections on June 9. It then rushed the policy into place with a memo on June 15 to heads of Ontario school boards announcing the new program. This slapdash approach to policy-making has been interpreted as an attempt to expand electoral support for the governing Progressive Conservatives by bringing (European) immigrant communities into the fold (see Gidney, 1999).

Table 1 Key context and policy activity regarding race, language, and belonging in Toronto schools, early 1970s to early 1980s.

At the federal level		At the Toronto board of education	
Multiculturalism within a bilingual framework era begins	Early 1970s in Toronto	- Privately-run heritage-language programs - First black culture school, organized by the black education project (January 1970) - First board-sponsored pilot programs in transitional bilingual education for Cantonese and Italian	
	- Official Languages Act (1969) - Multiculturalism policy (1971)	Work group on Multicultural programs (1974–76)	<i>Bias of Culture</i> issue paper (1974) - Draft report (1975) - Final report (1976)
At the provincial level	Sub-Committee on race relations (1978–79)		- Draft report (1978) - Final report (1979)
Heritage Languages program begins (June 15, 1977)	Work group on third Language instruction (1981–82)		<i>Challenge of Languages</i> issue paper (1981) - Draft report (1981) - Final report (1982)

Indeed, the HLP was a kind of political compromise. On one hand, the policy, which funds 2.5 h per week of study in a heritage language, was widely and quickly implemented. By the 1980 school year, it supported more than 78,000 students across the province in 3400 classes learning 45 different languages, with most enrollments (55%) in Toronto's public and Catholic school boards (Report of the O.P.S.T.F. Task Force, 1983). On the other hand, many language-minoritized and racialized communities viewed the policy's stipulations as divisive, for example with the Ministry's refusal to include Black Cultural Heritage programs as part of HL funding streams (see Bale and Kawaguchi, 2020). Many also viewed the new policy as further subordinating the status of HLs at school. HLs could not be used to teach curriculum content. Because they were not part of the formal elementary-school curriculum, HL classes had to occur outside the regular school day. Instructors came from the respective HL community, but were rarely certified teachers and thus not members of teachers' unions. Moreover, children of any background could enroll, rendering the policy's objectives unclear: was it intended to sustain ethnolinguistic identity for children raised with a heritage language, or to provide an enrichment activity for Anglophones (see Cummins and Danesi, 1990)? Could it do both at once?

In every way, then, this policy positioned HLs at the margins of school life, structurally separate from the Ontario curriculum and the teachers responsible for teaching it. Language-minoritized and racialized communities responded with sustained advocacy to broaden the scope of HL programs. At the same time, (mostly white) Ontarians filtered their racialized grievances against the policy through tropes of taxpayer concern over public spending, program feasibility, and the fragility of Canada's fledgling official bilingualism (see Bale, 2019). In this way, the HLP became the flashpoint of conflict over how schools should respond to growing linguistic and racialized difference in Ontario. These conflicts waxed and waned from 1977 to 1987, when a minority Liberal provincial government introduced reforms to the HLP that solidified the structure of the program that we live with to this day.

The remainder of this paper focuses on perhaps the most heated and explicitly racialized conflict over the policy and its implementation in the Toronto Board of Education. The analysis is divided into two parts. First, I begin by tracing teacher-union support for bilingual-education programs. This support was expressed most clearly in the Board's first effort to study the relationship between language, culture, race and schooling from 1974 to 76. Second, and by contrast, the outcomes of the Board's third and final work group on this issue in 1981–82 were met with direct and sustained union resistance, to such a level that the union and its members were denounced as racists. The paper concludes with lessons of this analysis for current efforts in the teachers' union to combat systemic racism, both within its ranks and in Toronto schools more broadly.

Round 1: The TTF endorses bilingual education

In June 1974, the Toronto Board of Education established the first of what would be three separate task forces to study the relationship between language, race, and culture in its schools (see Table 1). The Work Group on Multicultural Programs would set the pattern for this work. Each task force would begin by issuing a discussion paper, and then solicit written feedback and organize public hearings on the paper. To ensure that consultations were broad, copies of the paper would be sent to schools, specific Board-employee groups and/or their organizations, parent and community organizations, politicians (provincial and federal) with ridings in Toronto, the media, etc. The work groups would also consult scholarly and practitioner publications from across Canada, the US and Europe related to their inquiry. Based on these consultations and research, the work groups would write a draft report with a series of recommendations for consideration. The draft report would then undergo a similar, if less extensive, consultation process, leading to a final report with recommendations submitted to the Board for deliberation and potential approval.

As the Work Group on Multicultural Programs got underway, it extended an invitation to the Toronto Teachers' Federation (TTF) to participate in the group's deliberations over multicultural programs. The invitation stressed that the work group was "most anxious that the advice and counsel of teachers be clearly heard" (Kerr, 1974, p. 1). The president of the TTF responded with thanks for such a proactive invitation, noting that TTF Executive Board member Muriel Anderson would serve as the liaison between the union and the work group (Wooding, 1974).

In January 1975, Anderson wrote the brief that would become the TTF Executive's interim position with respect to the work group's inquiry. The brief spilled little ink in defending bilingual-education programs, because "informed individuals are presently in favour of such programs in principle" (Anderson, 1975, p. 2). Yet, the brief acknowledged that putting such principles into action is more complicated; as we will see shortly, Anderson's comment was remarkably prescient. The brief endorsed two models of bilingual education to be implemented depending on student needs or interests: *transitional bilingual education* (wherein the less dominant language is used to teach curriculum content in the early grades while students become proficient in the dominant language; thereafter, only the dominant language is used); and what would now be understood as a weak form of *maintenance bilingual education* (wherein a few school subjects, but not all, are taught in the less dominant language for a longer period of time so that the student maintains proficiency in the less dominant language as well).

The brief's support for language-minoritized and racialized students is couched in terms of the "problems" their linguistic, cultural and racial otherness presents at school. While the brief endorsed different kinds of bilingual programming, the rationale for such programs was to best integrate linguistically-minoritized and racialized youth into the Canadian mainstream. This is wholly consistent with the liberal multicultural tradition of bilingual education that Flores (2016) has identified in the United States, which "position[s] bilingual education for Latino students within a larger project of assimilation into [dominant] relations of power" (p. 14). Indeed, the very euphemism common at this time, and used in the brief, to refer to linguistically and racially diverse youth—*New Canadians*—suggests this assimilationist perspective.

Yet even working within a liberal-multicultural framework, the brief was razor sharp in its analysis of the conditions that constrain bilingual education. Anticipating the central issues that would lead to explosive battles over HL classes and the provincial policy that funded them, the brief noted that for bilingual and other linguistically- and culturally-responsive programs to succeed, they require (1) a high degree of community involvement in programs and planning; (2) decentralization and greater autonomy for individual schools; (3) meaningful funding; and (4) qualified staff. On the latter point, it was here that the TTF first articulated its expectation that instructors in bilingual and HL programs be fully certified teachers, a position they would later (and quietly) drop. To underscore their stance, the brief cited minutes of Board meetings to stress that “the Toronto Board had not given high priority to bilingual programs but instead has adopted a passive role” (Anderson, 1975, p. 4). The brief concluded with two short recommendations: that bilingual programs as described in the brief be made available on a pilot basis in select schools to all students who require the support or simply wish to participate; and that the Board make this a high priority by allocating the appropriate funds and qualified staff to make it happen.

The brief was quickly adopted by the TTF Executive and later sent to area representatives, who were then to organize local discussions among TTF members about its substance. It is not clear at this stage in my research whether these local discussions ever happened. What is clear is that the brief stalled: as the Board’s work group was preparing its final report in October 1975, it became known that the TTF brief had only been accepted by the union as an *interim* position. Neither the substance of the brief nor its two recommendations were ever formally adopted as TTF policy (Chown, 1975). I am not yet able to determine why the brief stalled: because of internal union opposition to its content, an oversight in an otherwise busy organization, or perhaps a combination of the two? Indeed, a new TTF president had been elected in the spring of 1975, so perhaps this reflected a new stance toward the proceedings of the work group.

What I can note is the gap between the work group’s *draft* report, which included several recommendations for bilingual programs similar to what the TTF had proposed, and the *final* report, in which those recommendations were dropped. In the end, the work group itself settled on the compromise of offering HL classes that taught the language as a subject only (i.e., not used to learn curriculum content). This is the same model that the province would endorse the following year in its Heritage Languages Program policy. In other words, if there had not been broad support within the union for full bilingual programs, it seems that support was also lacking among work group members themselves, such that bilingual-education programs were sidelined. Not until the third and final Board task force in 1981–82 would this question be revisited again. It was this final round of deliberations on the relationship between language, race and culture that led to explosive conflicts in Toronto.

Round 2: The TTF’s fight to end daytime HL classes

If the Board thought the question of heritage languages, or of the broader relationship between race, language and culture in its schools, was settled with the recommendations approved from the first work group, it would soon be proven very wrong. Between 1977, when the province’s Heritage Languages Program appeared, and the spring of 1982, when the Board began to implement recommendations from its third and final task force, the question of where—indeed *whether*—heritage languages (HL) belonged in publicly-funded schools was hotly contested. The province’s new policy was greeted by scores of angry letters written mostly by white Ontarians to the Ministry of Education, while right-wing tabloids such as the *Toronto Sun* regularly denounced the policy and Toronto’s HL classes as a threat to Canadian unity (see Bale, 2019). In spring 1982, as the Board held public meetings on implementing the recommendations of its final work group, tensions spilled over; Fig. 1 presents a picture of parents and other community members at one such meeting.

The media described these meetings as “explosive confrontations” over a “language battle ready to explode” (Spears, 1982, p. A6), with “voices raised in anger against foreign tongues” (Miller, 1982, p. G6). Harish Shah, a parent of three children in Toronto schools, described racist threats made by hecklers after he spoke at one of these meetings: “They told me next time they’ll bring white sheets” (Maychak, 1982, p. A6). A board trustee reported receiving phone calls at home threatening his safety (Matas, 1982) after another of these meetings.

It was in this heated, highly racialized context that the Toronto Teachers’ Federation threw all its weight behind ending daytime HL classes. In the second part of my analysis, I discuss: (1) the third and final work group that set the policy stage for this battle; (2) how the TTF had engaged with the work group; and (3) the terms on which the union waged its battle against daytime HL classes.

The Work Group on Third Language Instruction and its final recommendations

The Work Group on Third Language Instruction, the last of the Board’s three task forces, issued by far the most comprehensive and progressive recommendations as related to the relationship between language, race and culture in Toronto schools. For example, in its recommendations, the work group used the language of *bi-* and *multilingualism* to avoid any sense of prescribed order in how multiple languages are learned or used by Toronto youth. It is worth quoting from the final report at some length to give a sense of the work group’s thinking. Fig. 2 presents the work group’s first two recommendations in full.

Two aspects of this excerpt require comment. By “comprehensive,” the work group meant that the Board should adopt a *single* policy to encompass the manifold dimensions of multilingualism in Toronto: learning English as an additional language or standard Canadian English as an additional dialect; learning about historical and contemporary Black language practices as part of Black Cultural Heritage programs; learning Indigenous languages; learning heritage languages; learning French as either a first or

Fig. 1 Photo by Susan Tirimacco of a community consultation meeting over daytime HL classes, 1984; Davis (1984, p. 2).

additional language (including, as recommendation 6 would articulate, establishing Black Cultural Heritage programs in French); and, at the secondary level, learning modern and/or classical languages. Hitherto, the Board had treated each of these dimensions as discrete; indeed, while the Board's previous task forces addressed each program type in their reports, they addressed them as distinct issues affecting different student subgroups. By contrast, in this report these various dimensions of language education were construed as a single phenomenon of multilingualism that was relevant to all Toronto students. From the work group's perspective, Toronto schools therefore bore the responsibility to sustain these multilingual practices. Second, this excerpt indicates the work group's perspectives on *who* had the final say in determining what one's bi- or multilingualism should sound like. According to the logic of this final report, *bilingualism* would be a requirement for all students, in which case the Board assumed the authority to issue such a requirement. Whether students chose to "develop proficiency" in additional languages, (i.e., to expand their *multilingual* abilities) was ultimately up to them and/or their parents.

If this final work group adopted such inclusive and progressive positions with respect to multilingualism, it is in large part due to the activism of language-minoritized and racialized supporters of HL and Black Cultural Heritage programs. In the five years between the start of the province's HLP policy and this work group, the Board faced sustained pressure to allow HLs to be used as a medium of instruction in bilingual programming. For many advocates, if HLs were not used to teach curriculum, alongside English and French, they would always be relegated to the margins of school life, both symbolically and in practice. Bilingual HL programs however, would contravene Ontario's *Education Act*, which allows only English and French to be used to teach the curriculum. As such, there had been multiple efforts to amend the act, including 4 separate private members' bills in Ontario's legislature between 1978 and 1987. In each case, these efforts failed; to this day, the *Education Act* restricts the language of instruction to English and French only, with very few exceptions.

Second, the provincial HL policy had always allowed for daytime HL classes (by extending the school day by 30 min and slotting in HL instruction, usually around lunchtime). However, and perhaps by historical accident, most HL classes in the Toronto Board of Education were held after school or on weekends. Advocates pressured the Board to change this by expanding daytime HL programs. If HLs were not allowed for use in teaching curriculum content, then the next-best option for many advocates was to include them as a subject during the school day to bring HLs closer to the heart of school life. Finally, and by contrast, some advocates argued that mainstream schools would never be welcoming of linguistically- and culturally-responsive programs. Instead, they called for magnet schools, in which a single HL would be taught on a bilingual basis with English. The debates around this third demand were sharp and fall outside the scope of this paper. But they raised fundamental questions about whether inclusion and equity were indeed even possible in mainstream school environments. Taken together, this advocacy and the related debates directly

1. That the Toronto Board of Education develop and implement a comprehensive language policy.
2. That the Toronto Board of Education endorse and actively promote the improvement and co-ordination of its language programs and develop a language policy with the objective of providing programs for students at all levels of the Toronto school system to enable them to become multilingual, trilingual or bilingual adults for the direct purpose of:
 - (a) assisting all students to develop proficiency in English.
 - (b) assisting all students, including francophone and students of Native Ancestry, to hold safe from loss or deterioration, to develop and, in those instances which render it necessary, to relearn their original language or languages.
 - (c) assisting all students to attain a proficiency in at least one language other than their own in accordance with the definition of proficiency levels provided by the Ontario Ministry of Education.
 - (d) assisting all students to attain proficiency in one or more additional languages, in accordance with the definition of proficiency levels provided by the Ontario Ministry of Education, as they, or their parents or guardians if the students are minors, consider appropriate.

Fig. 2 First two recommendations from the Work Group on Third Language Instruction final report. Source: [Toronto Board of Education \(1982, p. 71\)](#).

shaped the work group's inquiry, as reflected in its final recommendations that were so comprehensive in nature and so focused on expanding daytime HL classes.

TTF engagement with the work group

The Work Group on Third Language Instruction was constituted somewhat differently from the Board's first task force. This time, TTF representative Imogene Walker was a member of the work group, not merely a liaison as Muriel Anderson had been with the first work group. Moreover, HL education had since become more institutionalized in the Board. The Board had established the Heritage Languages Advisory Committee, with representatives of various language-minoritized and racialized communities in Toronto, to serve as a liaison between these communities and the Board. Indeed, four of the 13 members of the work group were from this Committee. The work group also included Miriam DiGiuseppe, a widely respected member of the Italian-Canadian community who was the central Board administrator responsible for HL programs. Finally, the work group included other Board administrators, seconded staff, a representative of the principals' association, and Board trustees. In this way, the work group consisted of individuals representing the various communities and employee groups with a direct stake in the future of "third-language" instruction.

The TTF was directly engaged with the work group's inquiry from the get-go. As had become the pattern, the work group distributed a discussion paper, *The Challenge of Languages*, for which it sought written and oral feedback. In the TTF's response, the union continued to operate in a liberal-multicultural framework for linguistically-responsive programs, insofar as it understood maintenance of children's home languages primarily as a resource for acquiring English and integrating into the mainstream of Canadian life. However, the brief also called for an autonomous, community-driven approach to local school management and the need for schools and teachers to be responsive to community interests. Again, it is worth citing the brief's language at length to give a fuller sense of the union's stance. [Fig. 3](#) reproduces its opening paragraphs.

The balance of the brief makes good on the statement that "the issue is not whether English should be taught but how the mother tongue can be retained." The brief identified six profiles of linguistically- and culturally-diverse students in Toronto schools; it argued that while English-as-Second-Language programs might support the needs of *some* of these profile types, HL classes support

TTF RESPONSE TO "THE CHALLENGE OF LANGUAGES"

The Toronto Teachers' Federation is committed to a decentralized, community-based process of education. The realities of our city, therefore, require that we as educators respect the concerns of the majority of the children in Toronto, whose first language is other than English.

Whereas it should remain our main objective to provide children with the self-esteem and basic skills to provide equality of educational opportunity, we must begin from the cultural and linguistic heritage of the children we teach. It is often argued that children who develop a greater understanding and pride in their ethnic background are better able to deal with the challenge of learning English.

It is for this reason that we can agree with the discussion paper premise that "the issue is not whether English should be taught but how the mother tongue can be retained."

Fig. 3 Opening paragraphs from the TTF brief to the Work Group on Third Language Instruction, 1982. [Toronto Teachers' Federation \(1981, p. 1\)](#).

all of them and thus should be expanded in Toronto schools. The brief also addressed questions of feasibility, given that so many languages were spoken across Toronto. It viewed HL classes offered after school or on Saturdays as the most practical option, even calling for the creation of itinerant HL positions to support HL classes in schools with smaller enrollments. However, the brief recognized that "many parents of children enrolled in after-school heritage programs are dissatisfied by the apparent lack of intensity" ([Toronto Teachers' Federation, 1981, p. 2](#)). As such, the brief concluded that the "real issue" (p. 2) facing the work group is how "to increase the amount of time children spend in third language instruction" (p. 3).

As its first recommendation, the brief argued that "where a significant majority of children come from one ethnic group," HL classes should be integrated into the school day. The brief understood that both school staff and the local community would have to concur on such a decision. The brief reiterated the union's call for HL instructors to be fully certified teachers "where possible" (p. 3) and paid a teacher's contractual salary. With respect to debates about setting up "heritage language schools" and other kinds of magnet programs, the brief sided squarely against such proposals.

Similar to the first work group, the final recommendations of the Work Group on Third Language Instruction were consistent with the spirit of the TTF brief. The work group rejected "heritage language schools" and other magnet programs. Instead, it focused primarily on how to increase the number of Toronto schools with daytime HL classes, and it laid out a framework for how schools could make a collective decision about whether to integrate HL classes into the school day. Furthermore, the final report outlined a plan to pilot bi- and trilingual programs, going so far as to call on the Director of Education to work with the Ministry of Education to amend the *Education Act* to allow for non-English and non-French languages to be used as medium of instruction. Finally, all 13 members of the work group signed the final report before it was distributed. Only one member, Antonio Vaz of the Heritage Languages Advisory Committee, signed "with reservations" ([Toronto Board of Education, 1982, p. v](#)). For her part, TTF representative Imogene Walker signed without indicating any reservations, suggesting that the union had accepted the work group's final recommendations.

Backlash

In the year between the work group's final report in March 1982 and the Board's implementation of its main recommendations in March 1983, the TTF's actions took a sharp turn, contradicting the very principles and recommendations it had just endorsed. The trigger for this turn was the Board's passage on March 10, 1983 of an "Operations Manual" to guide the process by which elementary schools could decide whether to initiate daytime HL classes. Two immediate issues came to the fore. First, instituting daytime HL classes would require extending the school day by 30 min. This meant teachers in schools with daytime HL classes would work 30 min longer with no additional compensation. Beyond the pay issue, it remained unclear which responsibilities, if any, teachers would have for those students *not* participating in HL classes during the extra 30 min. Second, this new procedure for deciding whether to initiate HL classes gave parents the ultimate say. If enough parents petitioned a school to consider daytime HL classes, the school would be required to hold a public meeting to discuss the program and how it works. A letter would then be sent home to all parents with similar information. Then, parents would vote; a simple majority in favor would trigger implementation of daytime HL classes. As Board employees, teachers were expected not to intervene, whether for or against, during this public consultation process. The Operations Manual thus construed this decision as one between the Board—represented by local school leadership—and parents in the respective community.

For the TTF, these were two steps too far; on April 11 it filed a grievance that would take three years to resolve. For the union it was unacceptable to have some of its members working longer hours than others without additional pay. But the larger issue related to the question of who gets to decide what happens in Toronto schools. The union argued that it had the right to negotiate the length of the school day and compensation with the Board directly; the Board took the position that it alone had the right, indeed the obligation, to implement Board-approved curriculum, such as daytime HL classes. In May, the grievance moved to mediation, and later to arbitration, not to be resolved for another three years. **Table 2** presents a timeline of the TTF's resistance to daytime HL classes from the filing of this grievance in April 1983 to the arbitrators' ruling in June 1986.

From the union's perspective, this was an urgent issue to resolve. As indicated in **Table 2**, by the end of the 1984–85 school year the potential existed for over one-half of Toronto's 110 elementary schools to be operating on an extended timetable with daytime HL classes. The union might have seen the writing on the wall and, for example, worked to ensure that all schools adopted daytime HL classes to remove the imbalance in work day and pay. Or, it might have supported efforts to amend the *Education Act* to allow HLs to be part of the formal elementary-school curriculum, thus removing the need to extend the school day by 30 min that created the disparity in the first place.

Instead—and under a new leadership with Jack McFadyen as president—the TTF threw all its weight into blocking daytime HL classes, contravening the very principles it had just articulated and agreed to through its participation in the Work Group on Third Language Instruction. As the vignette that opens this article suggests, McFadyen repeatedly claimed that the teachers' fight was against daytime HL classes only, not HL education overall. However, the union's words and deeds from 1983 to 86 indicate just the opposite. Closer examination of these claims reveals that the union was in fact challenging the legitimacy of HL education overall.

Central to the TTF's efforts to block daytime HL classes was questioning the legitimacy of "outsiders" to have a say in how local schools were run. Key examples of this stance appeared in a study conducted by the TTF's provincial "parent" union, the Ontario Public School Teachers' Federation (OPSTF), of the conflicts in Toronto over daytime HL classes. The OPSTF's final report from December 1983 contains multiple passages that suggested the TTF now rejected the "decentralized, community-based process of education" it had endorsed in March 1982. For example, the introduction to the report stated: "In the City of Toronto, the Board's School-Community Relations Department was becoming increasingly active in the ethnic communities. Increased interpretive

Table 2 Timeline of events in TTF's opposition to daytime Heritage Language classes.

June 1981–March 1982	• Work group on third language instruction • Among its many recommendations, it calls for expanded daytime HL classes • Lays out principles for how schools can decide on starting daytime HL classes
March–April 1983	• Board issues Operations manual to guide the decision-making process on whether a school should initiate daytime HL classes
Fall 1983	• TTF files a grievance against this procedural policy • Of Toronto's 110 elementary schools: • 12 already have daytime HL classes (in place since at least 1977) • 33 to use the new procedure to initiate the decision-making process • 13 announce they will begin that process in fall 1984 • OPSTF, the TTF's provincial parent union, conducts its own study of daytime HL classes
Jan.–Nov. 1984	• Final report issued in December • TTF begins its work-to-rule job action in January • In May, TTF votes to end the job action by September 1 • In November, TTF is in a legal position to strike and threatens to do so, but never did
June 1986	• TTF grievance from 1983 is settled by arbitration • Arbitrators side on every count with the board and against the TTF

services, multilingual communications, and the establishment of the powerful Heritage Languages Advisory Committee were significant developments" (Report of the O.P.S.T.F. Task Force, p. 2). Later in its overview of implementing daytime HL classes, the report noted, "In Toronto, at the prodding of the Heritage Languages Advisory Committee, the Director of Education 'designated' several additional schools" to implement the extended-day model (p. 11). Finally, in its analysis of three Toronto schools and how they deliberated over daytime HL classes, the report stated that voting over whether to implement daytime HL programs "has been influenced by lobbying" (p. 19). In this way, the OPSTF report suggested that the very structures the Board had set up to support linguistically- and culturally-inclusive programming had become too "powerful" and had overstepped their bounds by "prodding" and "lobbying" Board leadership and/or parents regarding daytime HL classes on local schools.

If the OPSTF report had been subtler, charges of outside meddling would become more direct as the TTF's work-to-rule job action began in January 1984. In reference to Alberto DiGiovanni, head of the Board's Heritage Language Advisory Committee, a *Toronto Sun* headline noted, "Director under fire as outsider" (McLeod, 1984, p. 3). Without attribution to any individual, the article stated "angry parents, trustees and teachers in the public school system want di Giovanni [sic] 'sent back to the [Catholic] school board where he belongs and can't create any more hassles for us'" (p. 3). The article noted that DiGiovanni lived in a suburb of Toronto, not in the city itself, while his wife served as a top administrator for Toronto's Catholic school system. Further, the article repeated a Board Trustee's claim that DiGiovanni might be reaping personal financial gain, insofar as Italian-language teaching resources he helped develop were being used in HL classes. This trifecta of insinuations—a foreigner both to Canada and to Toronto, Catholic, corrupt—reveal the anti-immigrant, indeed racialized, sentiment present in these claims that the TTF and others made about "outsiders."

The TTF also fought hard to limit the amount of control parents had over the decision-making process regarding daytime classes. In a letter of understanding between the TTF and Board issued shortly after the union's work-to-rule job action had begun, the two parties agreed to a number of compromises. One of these dealt with the voting process for deciding whether to initiate daytime HL classes. No longer was a simple majority enough to trigger these classes. Now, an "enriched majority" of parents must vote in favor of the program, and at least 50% of the school's student body must actually enroll in daytime HL classes for the program to go forward (Toronto Board of Education, 1984, p. 2). Exactly which percentage constituted an enriched majority was not stipulated. However, this interim agreement underscored the TTF's stance that parents cannot be trusted with decision-making authority over local schools. In the end, the concession failed on two counts. The TTF was still not satisfied with the decision-making process and continued with its work-to-rule job action. For their part, parents were so outraged by this enriched majority compromise that 16 members of the Heritage Languages Advisory Committee resigned the next day in protest (Brown, 1984b).

Furthermore, as the conflict over daytime HL classes progressed in 1982–84, one original TTF demand quietly fell away. No longer was the union insisting that HL instructors be fully certified teachers. Instead, the TTF demanded that its members have nothing to do with HL instruction in any way. The same letter of understanding referenced above reflected another area of interim agreement between the Board and the TTF, namely that classroom teachers "would not be required to have any involvement" with HL classes, would not be assigned any additional duties, and would only be required "to fulfill their professional commitment for remedial programming as may be appropriate" (Toronto Board of Education, 1984, p. 1). In this way, the letter of understanding between the Board and the union formalized the division between classroom teachers and HL instructors that continues to this day, positioning the latter as outsiders in the school community. And yet neither this formalized division nor the new definitions of "majority" from this letter of understanding were enough for the TTF to end its job action against daytime HL classes.

In a further move to challenge daytime HL classes, the union repeatedly argued that they posed a threat to other kinds of extra-curricular school programming, in particular after-school sports clubs and remedial help teachers offered to students. However, *how* the union made this argument suggested it was, in fact, questioning HL education overall. For example, in the OPSTF report introduced earlier, it raised the question of how schools support the "whole child." The report cited interviews with teachers who sponsored after-school sports and letters from provincial sports associations to stress that daytime HL classes crowded out space for these and other after-school programs. The report argued: "For Toronto schools which have prided themselves on addressing the needs of the whole child through many extra activities for students, as well as elaborate professional development activities for teachers, this extension [of the school day] erodes such beneficial activities" (p. 12). Later, it listed more specific implications: "This reduction of extended activities that address the need of the whole child may have serious effects on individual growth, team building, recreational opportunities, and school spirit" (p. 16). Such arguments were only possible by excluding HLs as another key part of supporting the "whole child," let alone building meaningful community and school spirit. In this way, the report subtly challenged to the very idea of HL education, not just the form it took in an extended school day.

Given these efforts—some directly aimed at ending daytime HL classes, others more indirectly challenging the legitimacy of HL education in Toronto schools—it is little wonder that the TTF and its members were accused of racism. Shortly after the TTF initiated its work-to-rule job action, parents denounced the union's actions. As one news report noted, "At a news conference yesterday, parents representing eight cultural communities—black [sic], Chinese, Greek, Italian, Portuguese, Asian [sic], Spanish, and French—called a two-week old boycott of after school programs 'racial discrimination' by teachers aimed at stopping heritage language programs" (Brown, 1984a, p. A6). At the news conference, Eduardo Sousa, the Portuguese representative on the Heritage Language Advisory Committee, said it plainly: "We believe the real reason behind the arguments used by the teachers is racism. They are discriminating against the teaching of any language and culture other than English" (p. A6). Sousa's comment provided further indication that many HL advocates interpreted the teachers' actions as rejecting the legitimacy of HL education overall, not merely the daytime model.

The union responded in two primary ways to deflect these charges of racism. First, it argued that the fact that teachers work with linguistically- and culturally-diverse children at all means they cannot be racist. Speaking to a reporter after a meeting of over 100 TTF representatives on February 17, 1984, TTF president McFadyen stated, “Teachers were outraged that anyone should accuse them of racism ... Teachers who work with children in immigrant communities are especially upset that their integrity and professional dedication have been challenged” (*Globe and Mail*, 1984, p. 5). Second, the TTF insisted that its concerns were contractual ones over working conditions, and not about the substance of daytime HL classes. The union used this “labour-dispute” logic as their primary strategy to deflect charges of racism. In its statement regarding the letter of understanding between the union and the Board in early mediation over the grievance it had filed, the TTF even went so far to demand that the Board “issue a joint public statement to the effect that, in the current dispute between the teachers and the Board, the Board is satisfied that the teachers’ actions have been motivated by concerns over working conditions and delivery of programs and not, as has been alleged, by racism or bigotry” (*Toronto Teachers’ Federation*, 1984, p. 2). What is revealing here is that the TTF looked to *the Board* to have its name cleared, and not to *parents* and other HL advocates. Indeed, a handwritten note on the Board’s copy of this TTF statement asked with incredulity, “TTF has issued writs? With respect to racism and bigotry?” (p. 2). In this way, the union insisted on separating notions of race and class and asserted their concerns were merely contractual grievances so as to deflect charges that their fight against daytime HL classes was racist.

At this stage of my research, I am not able to document what happened inside the TTF that led it to reverse the positions on bilingual education, HL classes, and decentralized schools rooted in community input that the union had developed as part of a decade of sustained public deliberation over the relationship between language, race and culture in Toronto schools. What is clear, however, is that once actual HL programs existed and once real mechanisms for greater parental input were in place, the union took a sharp turn to the right. In practice, the union questioned not only the legitimacy of linguistically- and culturally-inclusive programs such as HL classes, but also the very right of parents to have any meaningful say in what happens in their children’s schools. Moreover, at every turn, the union tried to mask the depth of its grievances by portraying them as limited to just a single model of HL education and focused on discrete issues of contract negotiations.

In the end, few were persuaded by these claims. Perhaps the sharpest assessment of the TTF’s backlash from 1983 to 1986 came from a progressive community newspaper, *Mudpie*, and one of its regular columnists, James McQueen. In April 1984, McQueen wrote:

And isn’t it an interesting list of new working class heroes—Bette Stephenson, Jack McFadyen, Nola Crewe, David Moll, and various elementary school principals. And isn’t the rhetoric equally inter-esting—“quality education”, “solidarity with teachers”, “the need for consultation”, “concern for the needs of the immigrant student”, the need for research. Gimme a break. McFadyen has accomplished exactly what he prom-ised to do when he ran for office. He’s wrestled control of the Toronto Teachers’ Federation from the socialist hoards. He’s driven a wedge between parents, the boards and teachers. He’s taken T.T.F. to bed with the right-wing educators in Toronto and he’s accomplished it all in the name of union solidarity and concern for the working conditions of teachers.

McQueen (1984, p. 22).

While McQueen hangs this right-wing backlash around McFadyen’s neck, it is important to understand the support he had among his union siblings. Recall that he was re-elected in spring 1984—that is, in the midst of this battle against daytime HL classes—by an overwhelming margin of 1368 votes to 147 for his rival. These votes in his favor accounted for 55% of the union’s entire membership of roughly 2500 Toronto elementary teachers.

Conclusion

On June 17, 1986, arbitration of the TTF’s grievance against how the Board implemented daytime HL classes was finally resolved. On every count, the arbitrators ruled against the TTF and for the Toronto Board of Education. By then, however, this outcome mattered little. Municipal elections in 1985 had ousted the “socialist hoards” McQueen referred to in his 1984 column—that is, Board Trustees aligned with the social-democratic New Democratic Party, were replaced with a decisively conservative school board. This new group set out to reverse many of the most progressive initiatives the Board had implemented after its first Work Group on Multicultural Programs in the mid 1970s (see *McCaskell*, 2005). Moreover, the sustained parent activism that had pushed the Board so far in its deliberations over linguistically- and culturally-inclusive programming was already beginning to wane (see *Dehli*, 1994). Finally, as mentioned early, a minority Liberal provincial government was elected in 1987; its reforms of the Heritage Languages Program, the policy behind the daytime conflict analyzed in this paper, solidified the structure of HL education in Ontario that we continue to live with to this day.

The decade of deliberation and conflict over HL programs and other kinds of linguistically- and culturally-inclusive programs represents one of the most important moments of *discontinuity* in the history of Ontario public education. As argued above, there had long existed a hierarchy of minoritized and racialized languages in Canada. During the 1960s, pressure from Quebec nationalism and the Red Power movement forced a break in the continuity of that hierarchy (see *Haque and Patrick*, 2015). Even if the federal government aimed to restore continuity by elevating English and French as official languages, the contradictions of multiculturalism within a bilingual framework in fact opened up significant political space to experiment with different kinds of

linguistically- and culturally-inclusive education. HL policies and the programs they funded were just one example of these options; but it is important to stress that they emerged in an era when so much seemed possible in terms of reinventing schools in ways that centered the linguistic and racial lives of the students who attended them. As this paper has argued, when this reinvention got too close to the Toronto Teachers' Federation, when this reinvention began to make demands on teachers themselves to change, the union reversed course on its own stances it had developed over 7 years, closed ranks, and threw all its weight behind ensuring schools changed as little as possible. It did so by counterposing the language of contract negotiations and working conditions to community-driven demands challenging racism and other kinds of discrimination in Toronto schools. This meant seeing parents as illegitimate outsiders, not as allies; indeed, as Clem Marshall argued in his campaign speech in 1984: "Parents are no longer behind us. We have lost them as allies with our behaviour" (Brown, 1984, p. A7). In the end, the union's backlash was an important part of bringing this moment of discontinuity to an end by the mid 1980s, leaving us with school structures that keep HLs at the margins of school life. These structures have changed little, if at all, since then.

This union scuffle may seem distant and focused on a school program that garners little attention in contemporary discourse or scholarship about education. Nevertheless, the lessons from this conflict are vital for us to study and reckon with. We are currently living through another moment of discontinuity as it relates to social and racial justice in Toronto schools. In July 2020, for example, the Ontario government proposed several initiatives to address systemic racism in the province's publicly funded schools (Office of the Premier, 2020). These initiatives, described by the government as intended to "help break down barriers for Black, Indigenous and racialized students" (p. 1), include banning suspensions in the early grades, ending the practice of streaming in Grade 9, and toughening sanctions against teachers who use racist or other discriminatory language. In announcing these measures, the education minister stressed, "To racialized students in Ontario: we see you" (p. 2). It would be hard for him not to: his announcement followed immediately after another explosion of activism against anti-Black racism in Toronto (Armstrong and Lorinc, 2020). As well, persistent activism by Black and Muslim parents in Peel District School Board, the province's second-largest board, has exposed the extent of racism within its schools, leading the minister to impose a change in board leadership last June (Rushowy, 2020).

Moreover, in June 2020, the Elementary Teachers of Toronto, the successor to the TTF, elected Jennifer Brown as president, the first Black woman ever to head the union. Her election is as important as the long-standing activism of rank-and-file ETT members to engage the union in social-justice, anti-racist and other kinds of equity work. Nevertheless, Brown has been a target of racist backlash for her activism and for speaking out against the discrimination that she and other Black teachers in Toronto schools continue to experience. As Brown said to the *Toronto Star*, "Some of the racism has come from my very own colleagues and fellow teachers. And I know that I'm not the only one facing racism, I know that many teachers and union members share the experience with bullying and discrimination because that's what I faced" (Gallardo, 2021, n.p.). The lessons from this conflict over HL education from some 40 years ago suggest that the fight against the racism that Brown faces both within the union and within Toronto schools is best waged by understanding how race and class collaborate in organizing school life, and thus must collaborate in informing social-justice teacher unionism. Moreover, this history makes clear that this fight against racism and other kinds of discrimination is not won through policy briefs and resolutions; those can be undone from one day to the next. Instead, this fight is based on sustained activism, both within the union, but—perhaps more important—alongside parents and students, not just as allies but rather as in solidarity based on the shared interests each group has in challenging racism and expanding social justice in Toronto schools.

In popular imagination, the term “student activism” conjures up images of student protests and demonstrations, like the student-led protests in Tiananmen Square, China in 1989 (Brown, 2021), sit-ins like the iconic Greensboro, North Carolina lunch counter sit-in of 1960 in the US (Schmidt, 2018), or occupations of administrative buildings, as when students barricaded themselves in schools during the so-called “march of the Penguins” in Chile in 2006 (Cummings, 2015); however, direct action is but one form of student activism. Student activism can also involve closed-door meetings with decision makers and efforts to educate others or raise awareness through such activities as tabling, issuing reports, or creating online content. Some scholars have argued for a broad definition of student activism that encompasses service and volunteering work (Braxton, 2016) or unapologetically showing up in educational spaces designed and intended for others (Stewart and Williams, 2019); however, not all students who participate in service-learning or civic engagement activities, and not all students who hold minoritized identities in their schools or universities would consider themselves to be activists (Linder et al., 2019). Even students who attend a protest may not feel comfortable applying the label of activist to themselves. For these reasons, it is important when studying student activism to center the identity claims and understandings that the students themselves embrace. This entry starts, therefore, by considering how activists themselves define the terms frequently used to describe them and their work. It then offers an abbreviated overview of the history of college student activism, followed by snapshots of three recent campaigns. It then zeros in on the US context and offers a close look at the issues and tactics mobilizing contemporary college student activists in the US. The entry concludes with a brief review of the literature on the effects of college student activism, for both the students and their institutions, drawn primarily from US-based scholarship.

Distinguishing terms

According to a recent sample of self-identifying college student activists in the US, *activism* entails “taking action to effect change in an unjust status quo” (Conner, 2020). This definition operates as an umbrella that can cover a wide range of actions and ideologies about justice, including conservative ideologies, but it underscores activism as active engagement in change efforts.

Some self-identifying student activists prefer the term *organizer* to *activist*. These students distinguish *organizing* as a form of activism that is sustained rather than sporadic or spontaneous; rooted in relationships rather than in a particular issue; and determined to build the power of the people who are organizing together to address the issues that matter to them. On campus, organizers may work to build the power of a particular identity-based group, such as transgender students or students with disabilities (Warnock and Hurst, 2016), or they may organize a group with a shared position, such as graduate student Teaching Assistants or non-unionized custodial staff. Organizing campaigns may focus on a particular demand or set of demands, but they do not end after a campaign is won or lost, because the long-term goal is sustained power and a seat at the decision-making table.

In contrast to organizing groups in which the issues of concern bubble up organically from the community members, *social movement organizations* (SMOs) emerge in response to an issue and exist to do the work necessary to sustain the broader social movement focused on that issue. The Hong Kong pro-democracy student organization, Scholarism, offers a key example. Created in 2011 by students opposed to a proposed Moral and National Education curriculum, Scholarism went on to play a critical role in sparking the Umbrella Revolution movement of 2014, organizing a week-long boycott of classes by university and secondary school students in the lead up to sustained, large-scale protests for democratic reform in central Hong Kong (Macfarlane, 2017). While some student-led SMOs exist independently from higher education institutions, others have established a presence on college campuses. For example, the Sunrise Movement, a prominent climate justice SMO, has hubs on many US campuses. The National Rifle Association (NRA), similarly, has established NRA Collegiate Coalition chapters on campuses across the US to engage students in advocacy for gun rights.

Of course, students do not need SMOs to set up shop on their campuses in order to translate social movements into calls for institutional change. In some cases, existing clubs or organizations, like the Black Student Alliance or an LGBTQ+ club, may take up the issues resonating in broader society, connect them directly to student experiences of oppression or injustice on campus, and put forward demands for change. In other cases, students reacting to an incident on campus or a global current event may find one another serendipitously, begin organizing, and only then decide to incorporate as a formal club or give themselves a group name (Fisher, 2018). NotAgainSU, discussed later in this entry, offers a prime example of this phenomenon. It is also important to note that while many social movements emerge off campus and quickly make their way onto campus, some social movements are born on campus. One such example is the Fees Must Fall movement, which arose from the Rhodes Must Fall movement that started at the University of Capetown in South Africa in 2015 and spread to other campuses around the world (Luescher and Klemenčič, 2017). Finally, some student movements may occur entirely off campus and focus on issues that are irrelevant or tangential to education policy or practice. Broadly understood as a collective effort “by a large number of students to bring about or prevent change” (Gill and de Fronzo, 2009, p. 209), these movements may focus on an issue that concerns youth. They become student movements, rather than youth movements, when the participants strategically decide to mobilize their identity as students for political or moral leverage. For instance, during the Road Safety Movement in Bangladesh, students wore their school uniforms and backpacks to advance a nonpartisan identity as responsible, hard-working students who deserved to be protected from reckless drivers by greater safety measures (Mirza et al., 2022).

In short, student activism, student organizing, and student engagement in social movement work are not synonymous. Activism may entail organizing and/or participation in social movements, but it also encompasses a broader array of actions. According to self-identifying student activists, some of these actions may be “small, daily acts,” like refusing to consume animals’ bodies or being an “upstander,” who calls out microaggressions, and some may be unconventional forms of activism, like participating in student government, facilitating a dialog, or creating digital art to raise awareness (Conner, 2020). While some student activists understand activism as “consuming all daily life,” others recognize “existence as a form of resistance,” and still others see a wide spectrum in between these two poles (Logan et al., 2017).

A final point of distinction worth noting is between student activism and youth activism. As a subset of youth activism, student activism refers to activism in which students’ identities or concerns *as students* are salient or when students use their campuses as mobilizing bases or stages for their activism. Classmates who meet up at an off-campus protest, unrelated to their institution, who hold signs and repeat chants that do not invoke their identities as students, would be better described as youth activists than student activists. Youth activism is the broader category because it includes young people who are not enrolled in institutions of higher education as well as those who are. Of course, the moniker student may refer to those studying in primary and secondary schools in addition to those attending post-secondary institutions. While it is certainly true that secondary school students have played key roles in social movements throughout history [from the Child’s March during the US Civil Rights Movement (Hunter-Gault, 2013) to the worldwide school climate strikes of 2019], this entry focuses on the activism demonstrated by college and university students.

An abbreviated historical overview of student activism

The history of student resistance stretches back to the advent of the medieval university. Boren (2001) traces the roots of student activism to the early thirteenth century when European students began forming collectives. For example, in 1217 a group of university students in Bologna, Italy organized a strike to protest their teachers’ tendencies to arrive late to lectures, if they came at all. Most of the earliest examples of student agitation were directed against the towns in which the universities were situated, where locals tried to limit student activity; however, students have long engaged in power struggles with administrators and faculty over university policy and politics.

Throughout history, students have also played pivotal parts in revolutions, liberal democracy movements, and nationalist uprisings. The revolutions of 1848 in Europe saw students play key roles (Altbach, 1989). In Vienna, for example, the revolution was actually started by medical students, who petitioned the monarch for free speech, a free press, a constitution, and academic freedom. When their petition was not signed, they staged a demonstration that inspired the monarch to flee the country, and they then took over the management of the city for months (Robertson, 1969). Citing examples from India, Kenya, Burma, and Vietnam, Altbach (1989) argues that student activists were also influential and active in struggles for independence in Africa and Asia during the 20th century.

In 1918, the Córdoba Reform spread across Latin America after students at the National University of Córdoba in Argentina organized to demand curricular changes, free tuition, and student inclusion in governance (Walter, 1969). Using protests, strikes, and occupations, students prevailed in effecting changes to governance policies, and their success inspired similar student uprisings not only in other Latin American countries, but also in Asia and across Africa, resulting in students’ participation in decision making becoming institutionalized (Ntuli, 2019).

1919 saw several dramatic moments of student activism around the world. For example, in Germany, students’ councils organized a strike involving more than 85% of Berlin’s vocational school students. Not only did this strike result in agreements to end the use of corporal punishment by instructors and a change in the school schedule from evening to day classes, but it was also credited with altering the power relations between students and their teachers (Weipert, 2020). Meanwhile, on May 4th, 1919, students from Beijing University gathered to protest the Paris Peace Conference decision to grant Japan control over Chinese

provinces. After the government issued a violent crackdown on student demonstrators, the students responded by initiating a mass strike, which spread to universities and secondary schools throughout China, and inspired a parallel workers' strike, eventually leading the government to reject the Treaty of Versailles's pro-Japanese provisions (Boren, 2001).

The 1920s and 30s witnessed what some scholars have called "the dawn of widespread student activism" around the world (Rhoads, 1998, p. 33). In the US in 1932 alone, The National Student League staged several strikes, mass demonstrations, and creative protests directed both inward, toward campus matters, and outward, toward events happening in the world around them. They addressed campus specific issues, such as harsh student discipline, unfair censorship attempts, and unjust faculty dismissals, while also engaging in national politics, organizing students to stand in solidarity with striking Kentucky coal miners, for example (Cohen, 1993). In 1936, tens of thousands of students in India engaged in protests against the English language requirement for entrance to Indian universities; students also formed the All-India Students' Federation to advance the cause of Indian independence (Boren, 2001). In 1937, Brazilian students formed the União Nacional dos Estudantes (UNE) to advocate for the improvement of post-secondary education (Green and Skidmore, 2021).

War was also very much on the minds of student activists during this period. In the US in 1935, more than 150,000 students boycotted class in a strike for peace, and 1 year later, in 1936, upwards of 185,000 students took part in an anti-war demonstration (Boren, 2001). During World War II, Brazilian students in the UNE successfully pressured the country's president to join the allied forces (Green and Skidmore, 2021), and students at the University of Munich, in Germany, started the covert White Rose society, whose members risked arrest and execution to distribute leaflets exposing the horrors of the Nazi regime and encouraging resistance (Boren, 2001).

During the 1950s, student activists led decolonization struggles across the African continent (Ntuli, 2019), uprisings against authoritarian regimes in Asia, and helped to topple repressive governments throughout Latin America (Boren, 2001). In Europe, the Hungarian Revolution in 1956 was set into motion by students (Boren, 2001). In North America, however, student activism subsided for a time after the 1930s only to dramatically re-emerge during the 1960s. In fact, Williams (2013) has observed that it wasn't until the 1960s that the term "student activist" first appeared in print.

During the 1960s, student activists across the world not only demanded more relevant curriculum, a greater role in university governance, and stronger student rights, but also became involved in broader societal struggles for civil rights and liberation (Brooks, 2017). In the US, the Student Nonviolent Coordinating Committee, formed in April 1960, when Ella Baker convened students from lunch counter sit-ins and urged them to assume leadership in the struggle for racial equality and civil rights (Rhoads, 1998). The Free Speech Movement, born at UC Berkeley in 1964, mobilized students on many campuses to fight for greater freedom of expression and autonomy from restrictive and repressive university policies and "administrative intrusion" (Rhoads, 1998, p. 2). Student protests against the Vietnam War also surged during the latter half of the decade, including teach-ins on many campuses as well as large-scale demonstrations not only in the US, but in Canada, West Berlin, the UK, and Japan (Boren, 2001).

1968 was a particularly pivotal year, with student movements emerging in countries like Italy, Czechoslovakia, Argentina, and Japan. In Germany in 1968, the West German Student Movement mounted a powerful challenge to the political regime (Altbach, 1968), and in France in May 1968, student protestors set off a seven-week uprising against the De Gaulle government, American imperialism, and capitalism (Boren, 2001). Meanwhile, in Mexico City, in 1968, as the country prepared to host the Olympic Games, months of student protests against repression and violence culminated when troops opened fire on thousands of student protestors, killing what to this day remains an unknown number of youth, with estimates ranging from 4 to 3000 (Ordorika, 2021; Richman and Diaz-Cortez, 2008).

The 1970s witnessed the Soweto Uprising of 1976, in which school children in Soweto, South Africa went on strike to protest the Afrikaans Medium Decree mandating the use of Afrikaans for the teaching of mathematics and social studies. The strikes spread across schools, and as momentum built, the Soweto Students Representative Council's Action Committee organized a march and demonstration (Brown, 2016). On June 16th, approximately 20,000 students marched from their schools to the rally site. Police responding to one of the largest marches unleashed dogs and fired shots into the crowd, killing more than 100 students. This act of violence triggered international outrage, including condemnation by the UN, galvanized university students, and marked what some experts view as the beginning of the end of apartheid (Gallagher, 2002). Throughout the late 1970s and into the early 1990s, across the US, student activists pressured their universities to divest from investing in companies doing business in South Africa.

The second decade of the 21st century saw student activism once again surge around the world. 2011 saw the rise of movements in which students played prominent roles, including the Arab Spring (Altbach and Klemenčič, 2014), the international Occupy movement (Brooks, 2017), and the Chilean winter, in which students protested for free public education and an end to for-profit education (van de Velde, 2021). The Chilean student movement of 2011, which can be seen as a continuation of the rich legacy of Latin American student-led resistance against imperialism and colonialism, inspired similar student movements in Colombia, Brazil, and Mexico (Guzmán-Valenzuela, 2017). On the Asian continent, in what became known as the "sunflower movement," students in Taiwan occupied the legislature in Taipei for 24 days in March 2014 to protest a trade agreement with China that was being forced through parliament (Macfarlane, 2017). Encouraged in part by their peers in Taiwan, a few months later, students in Hong Kong boycotted classes to call for full democratic elections. Their action inspired hundreds of thousands of citizens to take the streets in what became known as the "Umbrella Revolution," because protestors used umbrellas to shield themselves from the tear gas and water cannons used by police to disperse them (Macfarlane, 2017; van de Velde, 2021). In the US, the killing of Michael Brown sparked mass unrest in Ferguson, Minnesota during the summer of 2015. The "Black Lives Matter"

chants that rung out during these protests accelerated a movement, born 2 years earlier after the killing of Trayvon Martin, that quickly gained ground on campuses across the US, as students returned in the fall of 2015.

Student activism garnered international attention again during the 2015–2016 academic year. Around the world, student activists staged dramatic acts of resistance to campus policies, protested guest speakers, and forced administrators to engage in long-overdue conversations about institutionalized racism, sexism, and xenophobia (Conner and Rosen, 2016). They demanded that school leaders issue statements, change policies, revise curricula, develop new diversity initiatives, and reconsider building names, campus iconography, terminology, and investment holdings. They called on governments to reverse fees and tuition increases and invest in public education as a public good (Luescher and Klemenčič, 2017). In many cases, they were successful in effecting change. In the years since, new cohorts of students have built on these efforts, continuing to push for deeper, more transformative institutional change as well as broader social change. Although the work continues to feel incremental and incomplete for students with bold post-neoliberal social imaginaries, their ambitions and radical hope are paving the way for new possibilities (Cole and Heineke, 2020).

Below, I offer examples of campaigns student activists have sustained or launched since 2015 on three different continents. These three campaigns speak to the range of issues that galvanize student activists, as well as the diversity of tactics they use, ranging from organizing protests and occupations to releasing reports and using social media and traditional media to drive attention to their causes. The cases show that student activism can target the state, the educational systems, or institutional specific policies, practices, and culture. Despite their points of distinction, the cases also collectively illustrate the tenacity and courage of student activists. Each campaign took careful coordination and ongoing commitment, and each was animated by a sense of moral urgency and collective responsibility. These three cases ultimately reveal that even though progress tends to be incremental and requires vigilance, student activism can lead to change.

Fighting cuts to higher education in Europe

As in the US and Korea (Shin et al., 2014), across Europe neoliberal reforms and austerity measures have led to substantial funding cuts in government spending on higher education, resulting in rising tuition costs. Students have responded by conducting research, organizing mass protests, and leveraging the media. For example, the European Student Union published a study based on findings from a survey of 38 national unions of students across Europe, which found that “underfunding of HEIs is leading to reductions in student services, growing tuition fees, ultimately damaging education quality” (O’Driscoll et al., 2015, p. 6). The report called for countries to “take on the responsibility to fund the reforms that they have (or should have) implemented” and to involve students “in all discussions and decision-making” (p. 7). In Denmark in October 2015, between 22,000 and 40,000 student protestors marched to the Copenhagen Parliament, chanting, “Stop the budget cuts in the billion class!” “Improve quality,” and “Invest in the future” (Myklebust, 2015). Thousands of students demonstrated again 2 years later in five Danish cities to protest the effects of continued cuts to education funding (Danish students to demonstrate, 2017). After continued outcry, a new Socialist Government in Denmark passed legislation in 2019 to end the requirement that universities cut their budgets by 2% each year (Matthews, 2019).

Divestment at University of Cape Town

In February 2017, amid mounting pressure from student activists, the Convocation, a statutory body representing alumni, vice chancellors, and academic staff, voted in favor of a resolution to divest the University of Cape Town from all fossil fuel holdings within 5 years (Giamporcaro and Dhlamini, 2017). This vote marked the culmination of a 4-year campaign by student activists to demand divestment. Also in 2017, student activists in Fossil Free UCT won the creation of the University Panel on Responsible Investment (UPRI), an advisory body that would make recommendations pertaining to the endowment. Despite these wins, no changes occurred. In fact, it took four more years and two more votes by the Convocation in favor of similar resolutions before the UPRI formally launched. Shortly after its launch, in May 2021, students from the Green Campus Initiative, Fossil Free South Africa, and the Climate Justice Charter Movement staged a protest renewing their calls for fossil fuel divestment. Part of their protest involved delivering a memo to the Chairperson of the UPRI, which included demands for “more transparent and accountable communication on where the institution’s fossil fuel investments lie” and a commitment “to complete decarbonization of [UCT’s] operations by 2040” (O’Regan, 2021). As they have sustained their campaign, the student activists have drawn inspiration from not only the Rhodes Must Fall and Fees Must Fall movements, but also the South African apartheid divestment efforts of US and UK students in the 1980s and 90s and the Black Lives Matter protests of the day (Giamporcaro and Dhlamini, 2017; Kusmer, 2021).

#NotAgainSU

In the fall of 2019, in the wake of documented racial incidents on campus that student activists felt were not appropriately addressed by the President and Chancellor, students at Syracuse University in New York launched a sit-in in the Health and Wellness complex, under the banner #NotAgainSU. The eight-day sit-in ended when 16 of their 19 demands were met by the administration, with the remaining three demands partially met. The University’s Office of Diversity and Inclusion posted each demand, the university’s response, and progress indicators online on a page devoted to concerns of the #NotAgainSU students. When new anti-Semitic

and racist images began circulating again on campus, however, the students understood this progress to be inadequate and launched a second occupation, this time of the main administrative building. This occupation lasted for 32 days and only ended when the Covid pandemic shut down the entire campus. During this occupation, the student activists revised 18 of their original demands, and added ten new demands. Administrators and protesters were in negotiations in early March, joined by professors, parents, and legal counsel, when the Covid pandemic forced the campus closure. On the 1-year anniversary of launch of sit in, Feb 17, 2021, the #NotAgainSU issued a letter, which centered an abolitionist framework and blasted surface-level reforms (“i.e., body cameras, diversity training, creating more committees, etc.”) as “ineffective because they will never solve any problems that deal with systemic issues because it does not begin to identify the root causes of racism and oppression.” The work of #NotAgainSU continues.

Tactics, issues, and campaigns of US college students

Contemporary college student activists in the US draw on a wide and ever-expanding repertoire of strategies and tactics, restlessly innovating in their efforts to effect change. In addition to “tried and true” practices, like protests, sit-ins, teach-ins, and strikes, students have deployed newer tactics, like “mic-checks” or echoed refrains during lectures by controversial speakers and die-ins. These tactics may be considered variations on a theme, in that they represent forms of protest, sit-ins, or even political theater. Conservative students have staged provocative events, such as affirmative action bake sales, in which they charge students of different races different prices and “Catch an Illegal Immigrant Day” (Cowen et al., 2019). The most notable tactical innovations, however, have come from students’ use of digital media, as students avail themselves of the tools of their day to make their voices heard. This is not to say that digital activism has taken the place of old-fashioned frontline activism. According to one study, protests and demonstrations remain the most common tactic used by student activists, reported by more than 80% of a sample of 237 student activists representing campuses in 47 US states (Conner, 2020); however, the novel use of digital media by Gen Z student activists continues to be noteworthy.

Data from recent studies of US student activists’ tactics highlights the emergence of digital activism in recent years. In a study of 79 4-year private US college campuses between 1989 and 2010, Barnhardt (2014) found that more than half the campuses reported experiencing petitions, rallies, and letter-writing campaigns, and a little more than a third reported experiencing student protests and demonstrations. The next most common tactics were leafletting and pamphleteering, experienced on about one-quarter of the campuses. Notably, Barnhardt’s list of tactics did not include online or social media activism. Five years later, in a 2015–2016 study of US student activists, Conner (2020) found that more than 60% of the sample reported engaging in online campaigns. And in 2020, during the height of the Coronavirus pandemic, a study of US climate justice and gun violence prevention student activists found that 81% had created online content for their movement, 86% had participated in an online event, such as a rally, town hall, or webinar, related to their movement, and 100% had signed an online petition for their movement within the last 6 months (Conner et al., 2021b). These studies illustrate the growing prominence of digital activism among US-based student activists since 2010.

Today’s student activists use a full suite of digital media tools, including videos, memes, and posts, to raise awareness, mobilize people and resources, apply institutional pressure, and increase accountability. In addition to using tools like Zoom, Groupme, and Slack to coordinate and organize, activists use TikTok, Instagram, and Twitter to record or express their activism (Davis, 2019). Some activists denounce what they call “performative activism,” which refers to superficial forms of activism that are demonstrated online or in meetings or classrooms in order to burnish one’s image, and which are not buttressed by offline investments of time, money, or labor for the causes the activist purports to care about. Despite these critiques, online activism has become influential and impactful.

For example, during the summer of 2020, as people around the world reacted to the murder of George Floyd and called for a racial justice reckoning, the Instagram Black@ stories of Black students’ experiences of racism and microaggressions on particular US campuses attracted widespread attention, forcing institutional responses. At the University of Southern California, for instance, the President initially responded to the hundreds of stories posted to the Black_at_usc Instagram page by calling for forums, surveys, and interviews. The students rebuffed this approach as woefully insufficient and insensitive (Navarro, 2020). Under mounting pressure, the President then wrote to the community announcing several more substantive changes, including the removal of a controversial name from a building, the recognition of Juneteenth as a holiday, the launch of a new office and means of reporting incidences of bias, the creation of a Community Advisory Board for the Department of Public Safety, and the establishment a Task Force on Racial Equity, Diversity, and Inclusion, charged with examining processes that perpetuate racism and inequity and issuing recommendations within the year. Although it comes with risks, such as cyberbullying and doxing, online activism can galvanize real world change. Students have wielded this tool strategically to force administrators’ hands, compelling them to act in order to protect the institution’s reputation, if not the students who are voicing their hurt.

Paralleling the rise of digital media has been the rise in coalitions among student activists. Students have formed coalitions both on a single campus (Mustaffa and Mayorga, 2019) and across campuses (Keeton et al., 2021). Some coalitions are focused on a singular issue, like ending sexual assault on campus (Brodsky, 2016) or fossil fuel divestment (Harper et al., 2022), while others aim to build solidarities across issues, reflecting students’ understanding of systems of oppression as interlocked and entangled. Coalitions have helped student activists to build their capacity as well as their power. At Princeton University, for example, in May 2021, a coalition of five student organizations (Divest Princeton, Natives at Princeton, the Princeton Indigenous Advocacy

Coalition, Students for Prison Education, Abolition, and Reform, and Change Princeton Now) released a joint demand letter, which they also displayed in an art installation on campus.

Although identity-based activism remains prominent on US college campuses (Linder et al., 2020), single-issue activism is rare among Generation Z student activists. Prefiguring this development, Lorde (1984) wrote, "There is no such thing as a single-issue struggle because we do not live single-issue lives." One study found that only 10% of US-based student activists identify as single-issue activists, and 52% direct their activism at seven or more issues simultaneously (Conner, 2020).

In 2015, prior to the election of Donald Trump, the most prominent issues for US-based student activists were racial justice, gender equity, LGBTQ rights, human rights, and ending sexual assault. The top three issues have remained stable into 2021 (Greytak et al., 2021).¹ For a time, the mass shooting at Marjory Stoneman Douglas High School and the advent of March for Our Lives in 2018 vaulted gun violence prevention into the top issue areas of concern, but organizing in this area has since subsided. Climate activism has been on the ascendancy since Greta Thunberg emerged on the international stage, inspiring mass school strikes in 2019 and renewing calls for divestment from fossil fuels. Environmental and climate justice was the fourth most common issue area cited by a sample of 624 student activists in the summer of 2021 (Greytak et al., 2021). Meanwhile, racial justice has remained at the fore, especially after Trump referred to white supremacists as "very fine people," hate crimes surged on college campuses, and the police killings of George Floyd, Breonna Taylor, Walter Wallace, Jr., and other unarmed Black individuals drew hundreds of thousands to the streets to demand justice. Trump's Muslim ban, his fervor for building "the wall" between the US and Mexico, and his attempts to end the Deferred Action for Childhood Arrivals program also inspired considerable activism and advocacy among students, fighting for immigrant rights and protections for undocumented students. Finally, the Coronavirus pandemic and the economic precarity it exacerbated and exposed have contributed renewed energy to fights for tuition-free colleges and student debt relief. Outside the US, students remain engaged in pro-democracy struggles, in countries such as Argentina, Chile, Kenya, Mexico, Thailand, Uganda, and Venezuela, and in efforts to contest neoliberal education policy (Brooks, 2017).

Although both historically (Altbach, 1989) and currently, the majority of US college student activists tend to be leftist or progressive in their politics, conservative student activism is on the rise (Ince et al., 2018). The growing conservative student movement both reflects and feeds broader societal trends, such as that of Trumpism. Conservative student activists tend to be whiter and more economically privileged than their liberal counterparts (Ince et al., 2018). On some US campuses, conservative student activism is supported by deep-pocketed national organizations, such as the Young America's Foundation and the Leadership Institute, which issue "battle plans" for confrontational activism (Binder, 2013; Binder and Wood, 2013). In recent years, Turning Point USA has become particularly influential, growing from \$4.3 million in revenues in 2016 to 39.8 million in 2020 (Stone, 2021). In addition to staging events on and off campuses, Turning Point USA has encouraged students to record liberal professors and post the recordings online, and it maintains a "watch-list" of left-leaning faculty. On some campuses, as conservative student activists continue to stage provocative events and invite inflammatory speakers, they will incite clashes with liberal students and force administrators to articulate how they weigh competing interests, such as protecting freedom of speech and intellectual diversity on the one hand, while honoring institutional mission statements that call for respecting the dignity of all people, including the most marginalized, on the other.

Beyond campus, conservative students' complaints of a liberal bias and lack of free speech on campus are helping fuel efforts in some Republican-led states to defund higher education and to write legislation that erodes tenure protections for professors who teach critical perspectives on race and gender (Gaudiano, 2022). On their own, conservative student activists may have been less successful at changing their campuses than progressive student activists (Ince et al., 2018); however, in concert with policymakers, they are positioned to have a profound effect on higher education policy and practice in Republican controlled states.

Effects on students

The literature on US-based student activists suggests that students become activists for a variety of reasons. Some are moved to action by moments of moral outrage or "shocks to the conscience," that is, events or experiences that compel them to act (Holeman, 2007). Others journey into activism more gradually, in fits and starts, or through circuitous routes (Conner, 2020), and still others feel they have no choice but to be an activist—that their very existence is a form of activism (Logan et al., 2017; Stewart and Williams, 2019).

Regardless of how they come to identify as activists, scholars have framed this process in terms of sociopolitical development. Sociopolitical development involves aligning one's actions with one's social analysis and world view. According to the theory, activists evince both critical consciousness (or a critical perspective on social structures, systems, policies, and practices) and critical social action (or behaviors) intended to "influence or transform communities and societal systems to be more equitable and just" (Anyiwo et al., 2020, p. 86).

¹The American Civil Liberties Union (ACLU), a non-partisan organization with 1.6 million members and affiliates in every state, holds an annual ACLU National Advocacy Institute in late July (usually in Washington, DC, but virtually in 2020 and 2021). In its sixth year in 2021, the program has brought together more than 5000 high school and college-aged students (ages 15–24) from across the country. During the ACLU Advocacy Institute, students work with lawyers, organizers, and other experts to learn about the ACLU's issues, advocacy tools (judicial, legislative, and grassroots), and build networks to support each other as they return to their campuses and communities. For more information visit: www.aclu.org/institute.

Scholars have examined the benefits as well as the costs associated with engagement in activism and critical social action. These effects occur in various domains, most concentrated in academic/learning, emotional and physical, and relational domains. In each of these areas, the evidence for US-based student activists is mixed. It is, of course, important to recognize that these effects are shaped by the geopolitical context. In a relatively stable democracy, like the US, where freedom of speech protections exist, student activists may face less serious risks of harm than student activists in more autocratic and repressive regimes, like Russia, Sudan, or Nigeria, where protestors may be killed or disappeared or have their passports and assets seized by government officials.

Although some research with high school aged students has found associations between engagement in activism and positive academic outcomes, including higher GPA (Conner and Slattery, 2014; Seider et al., 2019) and SAT scores (Seider et al., 2019), the research with college student activists is contradictory. In a study of 25 student activists from 14 institutions, Linder et al. (2019) found students reported decreased academic performance and learning as a result of their activism, consistent with findings from other work (Vaccaro and Mena, 2011); however, in a study with 40 student activists from 32 different campuses, Conner (2020) found that 57% believe their activism enhanced their performance as students, while only 12% perceived an exclusively negative impact on their grades or learning, and 15% reported a mixed effect. Beyond indicators of academic achievement and self-reports, a large body of scholarship has identified a variety of learning outcomes associated with engagement in activism, including critical social analysis and critical thinking (Keeton et al., 2021; Kezar, 2010; Tsui, 2000; Quinn and Nguyen, 2017), time management and communication skills (Ollis, 2011), a better understanding of how to navigate institutional bureaucracies and systems (Keezar and Maxey, 2014), and leadership skills (Hoffman and Mitchell, 2016; Rhoads, 2016; Stewart and Quayle, 2019).

With regard to mental and physical health, the research is again inconclusive. Some studies highlight activism as a tool that allows students to cope with or even heal from the forms of oppression or violence they have experienced or continue to experience (Ginwright, 2010; Hope and Spencer, 2017). Some studies link activism to enhanced feelings of empowerment or agency (Christens and Peterson, 2012; Stake and Hoffman, 2001). Other work draw attention to the costs of engaging in activism, including exhaustion, fatigue, and burnout (Cho, 2020; Linder et al., 2019; Ortega-Williams, 2018; Smith et al., 2006; Stewart and Quayle, 2019; Stokes and Miller, 2019; Vaccaro and Mena, 2011). One study found that activism may decrease the stress and anxiety associated with experiencing microaggressions on campus for Latinx students, but increase it for Black students (Hope et al., 2018). Conner et al. (2021a) found that 60% of the student activists in their study reported that activism had adverse consequences for their psychological well-being. Nevertheless, the students remained committed to continuing their activism because the connection to others and sense of purpose they derived from their activism, in conjunction with the opportunities to effect change and practice self-care and collective care, helped to offset the stress, exhaustion, and guilt they experienced as a result of activism.

In the relational domain, results continue to vary. Some work finds that activism benefits students as they experience “meaningful interactions” and find “kinship” (Keeton et al., 2021). A recent quantitative study found youth organizers experienced greater gains in the areas of social capital and social skills than their matched peers, who were engaged in non-activist activities (Flores, 2020). Stake and Hoffman (2001) found that after participating in demonstrations, student activists felt less isolated. By contrast, other work has found that student activists experience increasing isolation from peers and family and their personal relationships suffer because of their activism (Jones, 2017; Linder et al., 2019). Results from a survey of 624 student activists demonstrated that on average, activists perceived the effect of their activism on their familial and peer relationships as more positive (4.36 and 5.88) than negative (3.28 and 3.47) (Greytak et al., 2021).

Clearly, activism is a complex phenomenon, with a wide range of possible effects. Questions remain about how the benefits and costs of activism may be experienced differently by students with different intersectional identities, practicing different forms of activism, for different reasons, under different institutional conditions, and in different regional contexts. The next generation of research on student activism can begin to tease out some of this variation.

Effects on institutions

Compared to research focused on student activists, considerably less contemporary scholarship examines the effects of student activism on institutions. A small but burgeoning literature documents institutional responses to activism (Cho, 2020; Cole and Harper, 2017; Fisher, 2018; Pryor, 2020). This research identifies a range of institutional tactics, including issuing statements, establishing task forces, launching surveys, holding town halls, and passing resolutions (Cho, 2020). Institutional responses to student activism may also include strategies such as gaslighting students; waiting out, placating or appeasing students; coopting student campaigns; or silencing students (Cho, 2020; Conner, 2020; Linder et al., 2019), as well as acceding to or accommodating students’ demands (Fisher, 2018; Williams and McGreevey, 2004). This literature has revealed that campus leaders’ responses to activists are motivated primarily by an imperative to minimize risk and protect the institution’s reputation. Nonetheless, questions of when, how, and why institutions change in response to student activists’ pressure campaigns have not been fully explored.

We know from earlier research that institutions do make changes because of pressure from student activists. For example, student demands in the 1960s led to the establishment of ethnic studies departments (Acuna, 2011; Claybrook, 2013; Pulido, 2006), the hiring of more faculty and administrators of color (Lee, 2011), and the creation of cultural centers on campus (Patton, 2010; Yosso and Benavides López, 2010). More recently, Bovill et al. (2020) credited student activism—enacted through protests, sit-ins, legal actions, federal complaints, and traditional and social media campaigns—in the US and the UK with challenging and changing federal policy regarding how cases of sexual assault are handled on college campuses, driving shifts in institutional

practices. Fisher (2018) analyzed four colleges' responses to student activists, finding that in all cases, institutions responded in "unconditionally constructive" ways to radical student activism, eventually accommodating student demands; however, this study stopped short of identifying "the specific factors determining the institutions' stances" (Fisher, 2018, p. 26).

Some work has found that even when institutions make changes in response to student activists' demands, these reforms do not translate into meaningful changes to the everyday experiences of students, leaving student activists feeling frustrated and demoralized (Cho, 2020; Hoffman and Mitchell, 2016; Pryor, 2020). As Kezar (2018) has argued, second-order changes that seek to fundamentally restructure systems are challenging to effectuate in higher education. Incremental change tends to be the norm. Furthermore, determining whether and how student activism changes institutional culture, influences public opinion, or foments social transformation is exceedingly difficult to measure. Innovative methods, including longitudinal approaches, are needed to better understand the short and long-term effects of student activism on their institutions and society.

Conclusion

Student activism has had a long and storied history. Around the world, students have catalyzed institutional changes, ignited social movements, and even helped topple governments (Altbach, 1989; Boren, 2001). Of course, not everyone has the privilege of being able to claim an identity as a student, and those who do tend to remain students only for a relatively short period of time. But in that fleeting moment, the small subset of students who don the mantle of activist, continue a rich tradition of envisioning a better future and pressing for progress.

EDITORS IN CHIEF – BIOGRAPHIES

Robert J Tierney

Rob Tierney is an international educator whose passion is for developing research partnerships to address local literacy needs with educators in different countries. Rob began his career as a classroom teacher in Australia, then proceeded to work in the United States, Canada, Australia and China. He is Dean Emeritus and Professor Emeritus of Language and Literacy Education at the University of British Columbia, the former Dean and Honorary Professor of the Faculty of Education and Social Work at University of Sydney, and a Distinguished University Professor at Beijing Normal University. In the United States, he has served on the faculties of the University of Illinois, University of Arizona, The Ohio State University, Harvard University, and the University of California. Rob has written a number of books and numerous articles on literacy especially related to global issues, diversity, and literacy development. His most recent book was entitled *A History of Literacy Education: Waves of Research and Practice* published by Teachers College Press in 2021. During his tenure as an educator, he has served as the President of the International Literacy Association, President of the Literacy Research Association, an Editor for the *Reading Research Quarterly*, the President of the Association of Canadian Deans of Education/ L'Association Canadienne des Doyens et Doyennes d'éducation, as well on a number of committees and boards for professional groups and government and nongovernment

agencies. In addition, he has been involved on a range of groups on projects globally including in Africa and Asia including for UNESCO, Children's Television Workshop, and Apple Computer.

Fazal Rizvi

Fazal Rizvi is an Emeritus Professor of Global Studies in Education at the University of Melbourne, as well as at the University of Illinois at Urbana-Champaign. He is also a Visiting Professor at the Universities of Turku in Finland and Pretoria in South Africa. He has written extensively on issues of identity and culture in transnational contexts, globalization and education policy, and Australia–Asia relations. He has published widely, and his book, coauthored with Bob Lingard, *Globalizing Education Policy* (Routledge 2010) is used widely in courses around the world. A sequel to this book, *Reimagining Globalization and Education* (Routledge 2022) has been published recently. Fazal is currently researching educational reform in Bhutan. He is a Fellow of the Australian Academy of the Social Sciences, a past Editor of the journal, *Discourse: Studies in Cultural Politics of Education*, and a past President of the Australian Association of Research in Education.

**Kadriye Ercikan**

Kadriye Ercikan is Vice President of Research and Measurement Sciences at the Educational Testing Service and Professor Emerita at the University of British Columbia. She is responsible for ETS's foundational and applied research and psychometric support of ETS's major testing products and contracts, and the NAEP contract for ETS. Her research focuses on validity and fairness issues and sociocultural context of assessment. Her recent research includes validation of score meaning using response processes, use of response process data for comparing groups and examining fairness and validity of interpretation, and use of scores from artificial intelligence–based automated scoring.

Ercikan is a Fellow of the International Academy of Education. Her research has resulted in 6 books, 4 special issues of refereed journals, and over 100 publications. She was awarded the AERA Division D Significant Contributions to Educational Measurement and Research Methodology recognition for another

coedited volume, *Generalizing from Educational Research: Beyond Qualitative and Quantitative*

Polarization, and received an Early Career Award from the University of British Columbia. Ercikan has been selected to serve as the NCME Book Series Editor (2021–2026).

SECTION EDITORS

Jason Beech is Associate Professor (Global Policy) at the University of Melbourne and visiting professor at Universidad de San Andrés in Buenos Aires where he holds a UNESCO Chair in Education for Sustainability and Global Citizenship. He is senior researcher of the National Council for Scientific and Technical Research of Argentina (CONICET), and Associate Editor of *Education Policy Analysis Archives*. He has been a member of the Board of Directors of the Comparative and International Education Society (2014-2016). Jason has published extensively on the globalization of knowledge and policies related to education. He has also written and is passionate about the challenges of educating for global citizenship and a sustainable future. He has taught in several universities in the Americas, Europe and Australia.

Professor Qing Gu is Director of the UCL Centre for Educational Leadership and Professor of Leadership in Education. She is the Past Chair of the *British Association of Comparative and International Education* (BAICE), Co-Editor of *Teachers and Teaching: Theory and Practice*, Associate Editor of *International Journal of Educational Development*, a member of the Research Standing Committee of the World Council of Comparative Education Societies (WCCES), and a member of the Research Evidence and Impact Panel for the Leadership College for UK Government. Professor Gu has directed and codirected many government and research council funded projects in the areas of teacher professional development, school improvement, and systemic reform and change. She has led a £1.9 m UK Economic and Social Research Council (ESRC) funded project *Schools as Enabling Spaces to Improve Learning and Health-Related Quality of Life for Primary School Children in Rural Communities in South Africa*. Some of her books have been translated into Chinese, Japanese, and Spanish.

Professor Smith is a New Zealand Maori of Te Aitanga a Hauiti, Ngati Porou, Kati MamoeNgati Apa, Ngati Kahungunu descent. He is a highly regarded and internationally recognized, Maori educationalist and scholar. He has been at the forefront of transforming Maori and Indigenous social, economic and cultural conditions through re-developing education and schooling outcomes. His work links theoretical thinking and practical applications within an ongoing cycle of transforming praxis.

Professor Smith trained as a teacher at Auckland Teachers College and taught in Auckland schools. He also lectured in Education at the Auckland College of Education. He was one of the first teachers and developers of a Kura Kaupapa Maori, an alternative, Maori philosophy and principles-based School. These Maori immersion schools have grown from a single entity in 1988 to over seventy-five publicly funded schools in 2015. His theoretical leadership in the Education Department at the University of Auckland helped inform the emergence of Maori Education as a distinct field of study across the New Zealand Tertiary Sector. This work has encouraged a wide range of academic studies focused on overthrowing persisting inequities within and as a result of education and schooling in New Zealand. His significant contribution to New Zealand education is to be seen in his work related to Kaupapa Maori as a theory of Transformative Praxis. All of these elements derive from his PhD research entitled, "The Development of Kaupapa Maori: Theory and Praxis (1997)".

Professor Smith's later academic work centered on developing theoretically informed strategies related to transforming high and disproportionate levels of Maori cultural, political, social, educational, and economic marginalization. He has been a significant scholar involved in the emergence of Tribal "universities" institutions (Wananga) and is the former foundation Chair of the Council for Te Whare Wananga O Awanuiarangi. He led the successful Treaty of Waitangi Claim and settlement for Awanuiarangi. In his former position as Pro Vice Chancellor (Maori) at the University of Auckland, he was responsible for developing significant structural change within the institution while working within the Office of the then Vice Chancellor, Dr. John Hood. Notable achievements included implementing a Maori development strategy within the University which required all Deans to be responsive in their performance results for Maori and Pacific advancement; the oversight of the Proposal and winning of a National Centre of Research Excellence (Nga Pae o te Maramatanga); the initiation of the Maori and Indigenous doctoral program aimed at creating 500 Maori PhD graduates across the country in five years; the recruitment of top Maori academic scholars into the University of Auckland; the development of Kaupapa Maori as a theory of transformative praxis and which has had national and international influence. Professor Smith also served on the University of Auckland Council for three years as the Professorial representative for Academic staff.

In 2007 Professor Smith accepted a role as the Universitas 21 Distinguished Visiting Professor in Indigenous Education hosted by the University of British Columbia (within the Faculty of Education). Although the position was initially intended for two years, the role was extended for a further three years. While situated at the University of British Columbia, Professor Smith also chaired the Educational Policy Studies Department for three years. These positions allowed engagement with many Canadian universities as well as other universities across the world.

Professor Smith has made significant contributions to the political, social, economic, and cultural advancement of Maori and indigenous communities in New Zealand and around the Pacific Rim. He has worked extensively with other Native/Indigenous/First Nation's peoples across the world, including in Canada, India, US mainland (including extensive work in Hawaii and Alaska), Norway, Taiwan, Chile, Australia, as well as with selected Micronesian and Pacific nations. He is a regular contributor to national and international forums and conferences. Professor Smith has been an authoritative voice within the critical debates on *social, cultural and economic inequality* both in New Zealand and abroad, and he maintains a strong influence in the Maori/Indigenous languages revitalization movements.

Professor Smith stepped down from the administrative position of CEO/Vice Chancellor at Te Whare Wananga o Awanuiarangi in 2015 after eight years in the role. He resumed his academic research and writing career. In 2019 he was invited to take up a special Chair – Te Toi Ihorei ki Purehuroa – A "distinguished Professorial position at large" established for him at Massey University.

Professor Smith has been recognized and honored for his international contributions, receiving an Honorary doctorate (D.Litt.) from the Okanagan University College in 2005, and an Honorary doctorate (LLD) from the University of Northern British Columbia in 2013; he was elected as a Fellow of the American Education Research Association in 2014, and was awarded a Queens Honour – a CNZM in 2014. He was given the Prime Minister's Life-time Achievement Award (2017); and received the Te Ururangi National Award for Education (Matariki Awards, 2019).

Professor Smith is married to Professor Linda Tuhiwai Smith and they have one daughter and two mokopuna (grandchildren).

Therese N. Hopfenbeck is Professor of Measurement Analytics in the Melbourne Graduate School of Education, The University of Melbourne. Before starting her position in Melbourne, she was Professor in Educational Assessment and Director of the Oxford University Centre for Educational Assessment. She is a Visiting Fellow at Kellogg College, University of Oxford, elected Vice-President of *The Association for Educational Assessment-Europe* and Lead Editor of the journal *Assessment in Education, Principle, Policy and Practice*. Dr. Hopfenbeck's research agenda focuses upon bridging research on self-regulation and classroom-based assessment and making sense of international large-scale studies in education. In collaboration with Professor Nancy Perry, University of British Columbia, she is currently leading an international network of researchers disseminating classroom-based research, funded by Social Sciences and Humanities Research Council of Canada (2020–2022). She is also currently Principal Investigator for two research projects funded by IB, on critical thinking in PYP schools internationally and evaluation of education reforms in Kent, UK (2020–2022). In 2020, she led the research on Critical Thinking in the Diploma Program in Australia, England, and Norway (<https://ibo.org/research/outcomes-research/diploma-studies/critical-thinking-skills-of-dp-students/>). Dr. Hopfenbeck was Principal Investigator for the PISA (2022) study in England, Northern Ireland, and Wales, in collaboration with Pearson UK (2018–2023). She was the Research Manager of PIRLS (2016), funded by The Department of Education, UK.gov, and Principal Investigator of a major ESRC-DFID research study, Assessment for Learning in Africa (ES/N010515/1) (2016–2019).

Since coming to Oxford in 2012, she has been the recipient of funding from ESRC-DFID, OECD, The Norwegian Research Council, Education Endowment Foundation, State Examinations Commissions Ireland, Jacob Foundation, and the International Baccalaureate totaling more than £2 mill in addition to a single grant of £4 mill in collaboration with SLATE: Centre for the Science of Learning & Technology at the University of Bergen, Norway. Prior to her appointment at Oxford, she worked as a postdoctoral researcher at the University of Oslo's research group for Measurement and Evaluation of Student Achievement at the Unit for Quantitative Analysis of Education (2010–2011). She is Adjunct Professor of the Norwegian University of Science and Technology (NTNU), member of the Visiting Panel for Research at the Educational Testing Service (ETS) in Princeton, expert member of the PISA (2022) Questionnaire Framework group, appointed by ETS and OECD (2014–2023). She has advised on the implementation of formative assessment programs in India, South Africa, Norway, and the Emirates and carried out policy work for UNESCO/OECD and the Norwegian Ministry of Education Norway. Therese has a presence on LinkedIn, ResearchGate, [Academia.edu](https://www.academia.edu/), and Twitter: @TNHopfenbeck.

Nataliya Ivankova, PhD, MPH, is Professor in the School of Health Professions at the University of Alabama at Birmingham (UAB). As an applied research methodologist working at the intersection of mixed methods, qualitative, community-based, action, and translational research, she is internationally recognized for her empirical and methodological publications. She shares her research expertise through teaching mixed methods and qualitative research courses, conducting workshops and guest lectures, mentoring doctoral students and junior faculty, and serving as key personnel on funded research projects. At UAB, she directs an online graduate certificate program in *Applications of Mixed Methods Research* and oversees the design and analytical aspects of qualitative and mixed methods studies through the Center for Health Informatics for Patient Safety and Quality. She is a founding Coeditor of the *Mixed Methods Research Series* (Sage) and serves as an Associate Editor for the *Journal of Mixed Methods Research*.

Professor Jahnke is Director of Toi Kura Centre for Maori & Indigenous Education. She was the 2019 inaugural Toi o Te Wananga Fellow. Professor Jahnke holds professional qualifications in education and is cofounder and immediate past Chair of the Indigenous Peoples of the Pacific Special Interest Group of the American Education Research Association (AERA). She currently serves on the AERA Executive Committee. She was a member of the Social & Human Sciences Sub Commission of the NZ National Commission for UNESCO, the NZ Bioethics Council, the NZ Ethics Committee on Assisted Reproduction Technology, and Chair of NZ Health Research Council Ethics Committee. She is currently Cochair of the Aotearoa Research Ethics Board and a Fulbright Scholar.

Berit Karseth, PhD, is Professor at the University of Oslo, Department of Education. Karseth's main research and publications lie in the field of education policy, reforms, and curriculum studies. She has edited four books and written several journal articles and book chapters in both Norwegian and English. Her most recent publications in English include articles published in the *Journal of Education Policy*, *Scandinavian Journal of Educational Research*, *Journal of Curriculum Studies*, and *European Educational Research Journal*. Karseth was the elected dean of the Faculty of Educational Sciences at the University of Oslo 2013–2016 and is currently in the leadership team of the research group Curriculum studies, educational leadership, and governance (CLEG) at the same institution.

Dr. Kenneth Leithwood is Emeritus Professor at OISE/University of Toronto and an honorary professor at the University College London and the University of Nottingham. His research and writing is about school leadership, educational policy, and organizational change. He has published extensively on these topics. For example, his most recent books include *Leadership Development on a Large Scale: Lessons for Long-term Success* (2018, Corwin), *How School Leaders Contribute to Student Success* (2017, Springer), and *Linking Leadership to Student Learning* (2012, Jossey Bass). Professor Leithwood is the inaugural recipient of the University of Toronto's *Impact on Public Policy* award, AERA (2011) *Outstanding Leadership Researcher Award*, the 2012 *Roald F. Campbell Lifetime Achievement Award* from the University Council for Educational Administration, and the Ontario Principals' Council *Outstanding Educator of the Year* award for 2017. He is a *Fellow of the Royal Society of Canada*. A recently published bibliometric analysis found that Dr. Leithwood was the most frequently cited, highest impact educational leadership researcher in the world.¹ Research.com's 2022 Ranking of the Top 1000 Scientists in the area of Social Sciences and Humanities ranked Dr. Leithwood 70th in the world and 7th in Canada.

Xiufeng Liu is a Professor of Science Education at State University of New York, Buffalo, and a Fellow of the American Association for the Advancement of Science (AAAS). He obtained his PhD from the University of British Columbia in 1993. Before his current position, he taught high school chemistry in China, and was a tenured faculty member at St. Francis Xavier University and University of Prince Edward Island, both in Canada. From September 2020 to August 2022, he served as a program director in the Division of Research on Learning of the National Science Foundation. Dr. Liu conducts research on measurement and evaluation of STEM education and student learning of cross-cutting concepts of matter and energy. Dr. Liu is currently a Coeditor-in-chief for the journal *Disciplinary and International Science Education Research* (Springer) and an Associate Editor for the *Journal of Research in Science Teaching*, a premier journal in science education.

Margie Maaka is a Professor of Education at the University of Hawai'i at Mānoa. Her PhD is in educational psychology. She also holds professional qualifications in education from the University of Waikato and Hamilton Teachers College. She is cofounder and current Program Chair of the Indigenous Peoples of the Pacific Special Interest Group (SIG) of the American Educational Research Association (AERA). From 2017 to 2020, she served as a member of the AERA Executive Council and Chair of the SIG Executive Committee. Before that (2014–2017), Professor Maaka served as a member of the SIG Executive Committee. She has also served as a member of the Ngā Pae o te Māramatanga Center of Research Excellence International Research Advisory Panel. Her research on community-based educational renewal saw her recognized as a national scholar with the Goodlad Institute for Educational Renewal. As Cochair of the Sovereign Councils of the Hawaiian Homelands Assembly's Committee on Education, she prepared educators and educational leaders for public schools in the Hawaiian Home Lands Trust communities. Currently, Professor Maaka is committed to the preparation of indigenous educational leaders in higher education. Her research interests include community partnerships, educational psychology/indigenous educational psychology, indigenous development and advancement, educational policy, multiliteracies, and language and cognitive development.

Diane Mayer is Professor Emerita at the University of Oxford. Her research and scholarship focus on teacher education and early career teaching, examining issues associated with the policy and practice of teachers' work and teacher education.

Daniel McCaffrey is the Associate Vice President of Psychometric Analysis and Research in the Research and Measurement Science unit of the Research and Development division at ETS. Dan's research interests include the evaluation of artificial intelligence scoring of constructed responses, developing tools and methods for causal modeling, evaluating the psychometric properties of student achievement growth measures derived from annual test scores, and methods to account for measurement error in secondary data analysis. Dan received his PhD in Statistics from North Carolina State University in 1991.

Judy Parr is Professor Emerita at the University of Auckland, Faculty of Education, where she was the founding Head of the School of Curriculum and Pedagogy. A psychologist, Dr. Parr's research program is located broadly within improvement science. Her expertise is in literacy, specifically writing and its development, encompassing instructional issues like teacher knowledge and practice and the assessment of writing. Much research has been collaborative, with colleagues and practitioners within major national projects for school improvement aimed at raising achievement in literacy and, internationally, as part of funded large-scale research projects, for example in Canada and Norway. Dr. Parr has published widely in the areas of literacy, assessment, and professional learning.

Jeong-eun Rhee is a Professor of Education, Long Island University, Post, New York. Born and raised in Seoul, Korea, she earned her bachelor's degree in Educational Psychology from Ewha Women's University. In 1992, she came to the US as an international student and received an MA in Educational Psychology from West Virginia University and a PhD in Educational Policy and Leadership from the Ohio State University. As an interdisciplinary cultural researcher and educator, her recent work focuses on developing and supporting transnational, intergenerational, and decolonial feminist knowledge projects in/through antioppressive education. She recently published *Decolonial Feminist Research: Haunting, Rememory, and Mothers*, which received an honorable mention for the 2022 Qualitative Book Award of International Congress of Qualitative Inquiry.

Fazal Rizvi is an Emeritus Professor of Global Studies in Education at the University of Melbourne, as well as at the University of Illinois at Urbana-Champaign. He is also a Visiting Professor at the Universities of Turku in Finland and Pretoria in South Africa. He has written extensively on issues of identity and culture in transnational contexts, globalization and education policy, and Australia-Asia relations. He has published widely and his book, coauthored with Bob Lingard, *Globalizing Education Policy* (Routledge, 2010), is used widely in courses around the world. A sequel to this book, *Reimagining Globalization and Education* (Routledge, 2022), has been published recently. Fazal is currently researching educational reform in Bhutan. He is a Fellow of the Australian Academy of the Social Sciences, a past Editor of the journal, *Discourse: Studies in Cultural Politics of Education*, and a past President of the Australian Association of Research in Education.

Theresa Rogers is Professor of Language and Literacy Education at the University of British Columbia. Her research interests include youth arts, media and critical literacies, adolescent literature, and teacher education in literacy. Most recently she published "Youth Activism through Critical Arts, Transmedia, and Multiliteracies" in the *Oxford Research Encyclopedia*. She is author of the book, *Youth, Critical Literacies and Civic Engagement: Arts, Media and Literacy in the lives of adolescents* (Routledge) and numerous articles in scholarly journals such as *Literacy Research: Theory, Method and Practice*, *Reading Research Quarterly*, *Pedagogies*, *Language Arts*, *Children's Literature in Education* and *Journal of Literacy Research*. See: <https://ubc.academia.edu/TheresaRogers>.

Professor Chika Sehoole is a Professor of Higher Education and the Dean of the Faculty of Education at the University of Pretoria. He obtained his PhD at the University of the Witwatersrand, Johannesburg, in December 2002. In 2003/4 he was a visiting Rockefeller postdoctoral fellow at the Centre for African Studies at the University of Illinois in Urbana Champaign. In 2005/06 he was a New Century Fulbright Fellow, again, at the same university. His research interests are in the areas of higher education policy, internationalization of higher education, higher education in Africa, and teacher education. He has served in several international research projects focusing on higher education and providing expertise from the South African and African perspectives. In 2013–2017 he served as the Chairperson of the Board of the African Network for Internationalisation of Education (ANIE). He currently serves as the chairperson of the Education Deans' Forum of South Africa. He has published a singled authored book titled "Democratising higher education policy, constraints of reform in post-apartheid South Africa" by (Routledge); three edited scholarly books on higher education and more than 40 articles in journal articles, book chapters, and popular media.

Roland Sintos Coloma is a tenured Full Professor of Teacher Education at Wayne State University in Detroit, Michigan. A scholar of history, cultural studies, and education, his research addresses critical questions of race, gender, and sexuality from transnational and intersectional perspectives. His publications include *Asian Canadian Studies Reader* (2017), *Filipinos in Canada: Disturbing Invisibility* (2012), and *Postcolonial Challenges in Education* (2009). His articles have been published in top-ranked peer-reviewed journals, including *Curriculum Inquiry*, *Discourse: Studies in the Cultural Politics of Education*, *Educational Studies*, *Educational Theory*, *History of Education Quarterly*, *International Journal of Qualitative Studies in Education*, *Paedagogica Historica*, and *Race Ethnicity and Education*. He has successfully garnered over \$2 million of external funding from federal, education, and nonprofit agencies, including the US Department of Education, National Education Association, Spencer Foundation, and Schultz Family Foundation as part of the Bill & Melinda Gates Foundation's Grand Economic Challenges. Roland has served in various university leadership roles as an assistant dean, department chair, graduate coordinator, and center codirector. He was president of the American Educational Studies Association (2018–19), editor of the *Educational Studies* journal (2014–17), and program cochair of Division G (Social Context of Education) in the American Educational Research Association (AERA). He received the 2017 Distinguished Scholar Award from the AERA Research on the Education of Asian Pacific Americans SIG and the 2015 Article of the Year Award from the AERA Queer Studies and Education SIG. In 2020, he was appointed to the Governor of Michigan's statewide Asian Pacific American Affairs Commission. Born in the Philippines and raised in California, he completed his PhD in Cultural Studies in Education and Minor in African American and African Studies from The Ohio State University in 2004.

Roger Slee is the Founding Editor of *The International Journal of Inclusive Education* and *The Journal of Disability Studies in Education*. A former Deputy Director-General of Education in Queensland, Australia, he has advised governments on inclusive education policy and practice. His published books include: *The Irregular School*; *Inclusive Education Isn't Dead, It Just Smells Funny*; and *Ethics and Inclusive Education: Disability, Schooling & Justice* (with Gordon Tait). Roger was commissioned by the UNESCO to write the scoping paper for the 2020 Global Education Monitoring Report, *Inclusion and Education*. Roger also held the Chair of Inclusive Education at the Institute of Education, London, and is now the Diamond Jubilee Professor of Disability & Inclusion in the School of Sociology & Social Policy at the University of Leeds.

Ninni Wahlström is a Professor of Education at Linnæus University, Sweden. Her current research focuses on transnational and national policy discourses and their implications for national curriculum and classroom teaching from a perspective of curriculum theory and educational philosophy. Most recent publications are "School and democratic hope: the school as a space for civic literacy" in *European Educational Research Journal* (2022) and Wahlström (Ed.) *Equity, Teaching Practice and the Curriculum*, Routledge (2022).

Lei Wang is Professor and PHD advisor of the Institute of Chemical Education, the College of Chemistry in Beijing Normal University (BNU). She is also the member of Teaching Steering Committee on Basic Education of Ministry of Education of China and the director of its branch Committee on Secondary Chemistry Education, the director assistant of Faculty of Education of BNU, vice director of the Institute of Science Education of BNU, and Chairman of the Chemistry Education Committee of the Chinese Chemical Society. She is one of the chief experts in developing the *Secondary School Chemistry Curriculum Standards* of MOE. She works as the chief editor of high school chemistry textbooks (Shandong Science and Technology Press, 2004 and 2019 editions) and junior high school chemistry project-based learning textbooks (Shanxi Education Press, 2018 edition). She achieved the first prize of the National Basic Education Teaching Achievement Award, the second prize of the National Higher Education Teaching Achievement Award, and the BAOGANG Education Outstanding Teacher Award.

Everard Weber is a retired professor. He has worked in the field of education for more than 40 years. Currently he is a research associate at the University of Johannesburg (UJ) and an academic advisor in the Future Professors Programme (FPP) at UJ. He studied African Languages and History at the University of Cape Town and Comparative and International Education at Harvard University. In South Africa he has worked at Crestway High School in Cape Town, the University of the Witwatersrand, and the University of Pretoria. A recent book is *A home away from home: a community of international and South African university students*. The FPP is a government-sponsored initiative that seeks to develop the next generation of professors and academic leaders in all disciplines, across all universities in South Africa. He is in addition presently conducting fieldwork on curriculum change in South African higher education with Professor Shireen Motala and Dr. Venise Joubert at UJ. This project is grounded in the history of southern Africa and hopes to contribute to the scholarship of postcolonialism.

Ian A.G. Wilkinson is Professor in the Department of Teaching and Learning at The Ohio State University and Honorary Professor in the School of Curriculum and Pedagogy at the University of Auckland, Aotearoa/New Zealand. He has a background in educational psychology with special interests in cognition, instruction, and research methodology as they relate to the study of literacy. He served as coauthor of the influential report, *Becoming a Nation of Readers* (National Academy of Education, 1985). He was Co-Editor of *Reading Research Quarterly* from 2006 to 2012 and was inducted into the Reading Hall of Fame in 2021. His research examines the impact of classroom discussion and dialogue on students' reading comprehension and argument literacy and the implications for professional development of teachers. Recently he coauthored books include *The Most Reasonable Answer: Helping Students Build Better Arguments Together* and *Quality Talk About Text: Discussion Practices for Talking and Thinking About Text*.

David B. Yaden, Jr., PhD, is the *Jewell M. Lewis Endowed Distinguished Professor of Literacy* in the Department of Teaching, Learning and Sociocultural Studies at the University of Arizona. Prior to his present position at the University of Arizona, he held appointments at Emory University, the University of Houston, and the University of Southern California. He served as Co-Editor of the *Journal of Literacy Research*, one of the premier research journals in the field of literacy studies, and was a Principal Investigator in the federally funded Center for the Improvement of Early Reading Achievement (CIERA) where he implemented an early literacy curriculum for linguistically diverse preschoolers in inner-city Los Angeles. He also directed a statewide consortium of researchers from Arizona's major universities in the evaluation of the state's early childhood initiative to evaluate health, developmental, and educational factors contributing to school readiness. His research interests and specializations include developmental issues in early childhood education, the acquisition of literacy and biliteracy in young emergent bilingual children, family literacy, theories of reading disability, microgenetic research design, and the application of complex adaptive systems theory to growth in reading and writing.

Volume 3: Ways of Knowing and Indigenous Education

Graham Hingangaroa Smith, Huia Jahnke, and Margaret Maaka

© 2023 Elsevier Ltd. All rights reserved.

Introduction: Transforming Indigenous Education

This volume of the Elsevier *Encyclopedia of Education* examines issues related to the education and schooling of Indigenous peoples. In recent years, indigenous education has become a focus due to persisting inequities in and as result of the educational opportunities experienced by most Indigenous peoples compared with dominant colonizing populations. The phrase “indigenous education and schooling,” as employed here, refers, on the one hand, to the experiences of Indigenous students both within and through conventional schooling developed mostly by and in the interests of dominant settler populations. On the other hand, this term references forms of education and schooling developed by indigenous groups, usually around their well-being, relating to language, cultural knowledge, cultural interests, and aspirations. A significant factor is that indigenous groups often struggle to assert their cultural recognition and survival within contexts that try to assimilate them into the culture and learning expectations of the dominant population.

In this section, we employ the definition of “indigenous” as defined by four conditions that predate the arrival of settler populations with their imposing societal norms:

- Historical and genealogical connections
- Strong cultural links to territories and surrounding natural resources
- Distinctive social, economic, and/or political systems
- Distinct language, culture, values, and beliefs

The reference “indigenous struggle” connotes indigenous resistance to the erosion of the four conditions named above. The destructive forces that eroded these conditions are called “colonization.” The term “struggle” describes indigenous resistance to these colonizing forces that are given impetus by unequal power and social relations. Settler populations have often employed various colonizing strategies thinking they were acting in the best interests of indigenous communities and that they were being helpful by assimilating the indigenous population as quickly as possible into the “mainstream” settler language, knowledge, and culture. However, in too many cases, the consequences of this strategy caused irreparable harm, such as the loss of indigenous languages and knowledge systems, including cultural beliefs, customs, and laws. Colonization has had other harmful consequences. Among them, are the forced and unjust treatment to deny Indigenous peoples their cultural rights through colonial laws and policies; economic exploitation through the loss of traditional resources such as forests and lands as a result of war, occupation, legal manipulation, and individualizing collective rights; religious persecution through the banning of traditional practices and instituting religious practices, ideals, and values associated with Judeo-Christianity; and differential access to democracy through the denial of voting rights. These strategies and many others served to reproduce settler interests. Colonization processes have been developed overtly and covertly by, and in the interests of, dominant settler populations, usually through a nexus of dominant power, culture, and economic interests. For Indigenous peoples, even with “enlightened” research and scholarship, the depressing news is that despite identifying and challenging these forms of colonization, colonization has not gone away. More often, colonization has simply changed shape and is being developed in new contemporary formations. In the present day, many of these new shapes of colonization are formed and legitimated within the neoliberal ideology of free-market economics, for example, where cultural oppression links to economic exploitation and where possessive individualism supersedes considerations of collective responsibility.

New forms of colonization are developed in multiple shapes, sites, and sizes comes to mind. The image of the Dutch boy standing in front of the leaking dike faced with the dilemma of numerous leaks of different shapes and sizes. He needs all sorts of stoppers to stem the leaking water, not just his fingers. The analogy here is that multiple forms of colonization require multiple “fit-for-purpose” responses. Our struggle in response to colonization is not a single struggle. This is the point made by Gramsci (1971) in his discussion of the concepts of “war of position” and “war of maneuver” in the form of struggles over ideas and beliefs. Thus, indigenous counternarratives that advance alternatives to dominant ideas of what is normal and legitimate need to be similarly positioned. They need to be different, nuanced, and fit for purpose. To reiterate, the indigenous struggle is not one struggle but many struggles across many different sites, shapes, and sizes.

The reason to position a volume of the Elsevier *Encyclopedia of Education* on the indigenous struggle over education and schooling is because

We will not have a sustainable social and economic revolution against the persisting inequities that accrue to indigenous populations without a prior or simultaneous education and learning revolution.

Smith (1997).

In this volume, we have assembled the work of several indigenous educators who contribute insights into their struggles within their own jurisdictions. The important point is that not all Indigenous people are in the same place regarding their struggle against colonization. Therefore, it is important not to make comparative judgments that create hierarchical value judgments about where different indigenous communities are at with their struggle. Instead, these contributions have been assembled simply to share and learn ways by which we might be able to improve our own education and schooling aspirations. We need to counter the colonizing imperative of divide and rule, where dominant interest groups often use a comparative strategy that uses one indigenous group to denigrate another. Comments such as, “Why can’t you be like ‘them’? They have high levels of success with their students.” or “What is wrong with your native community?” As an editing group, we understand that each of our indigenous contexts is very diverse, and our experiences of colonization are also different. This indigenous volume allows us to share our stories and to put all of our knowledge contributions into a central pool so that each of us can take what we need to reflect on and if appropriate, enhance our own contexts.

Transforming Indigenous Education

A key theme in this volume is transforming indigenous education. We deliberately use the term “transforming” instead of “transformation.” This is because transforming calls us to an ongoing enactment, whereas transformation suggests that we have arrived at some solution. The point here is that the indigenous struggle must be a continuous improvement cycle. [Smith \(1997\)](#) refers to this as a cumulative cycle of praxis. For most Indigenous peoples, the status quo is not working very well, and transforming is an important emphasis. Moreover, the need to focus on indigenous experience in and through education and schooling is driven by two imperatives. Firstly, there is the persistent problem of social, economic, and cultural inequalities suffered by indigenous communities. Secondly, the relatively recent focus that has been brought to bear on these issues by the release of the United Nations Declaration on the Rights of Indigenous Peoples (2007). Beyond this, significant issues focus on Education within different indigenous contexts. For example, the Truth and Reconciliation Commission inquiry into the Residential Schooling system in Canada and the subsequent list of 94 Calls to Action that impact the education sector; the major reform of Curriculum provision in Aotearoa New Zealand Education, and its focus on Māori learning success; also in Aotearoa New Zealand the new Government emphasis on the provision of Immersion Māori language schooling; the Education Compact discussions between the US Federal Government (DoE) and Native Alaskans which have resulted in five tribal state Schools to be established.

The phrase “transforming indigenous education” is ambiguous because it embodies two meanings. Both are important. The first meaning relates to the need to transform the process of how we educate and school indigenous learners. This calls attention to the need to scrutinize the material to be taught, how it is taught, and in whose interests the material has been selected. The second meaning relates to the outcomes of indigenous education and schooling, which also need to be transforming in order to provide schooling outcomes to realise success for indigenous students and to thereby make a difference.

The other connotation of the phrase “transforming indigenous education” emphasizes the need for indigenous education and schooling outcomes to realize successes for Indigenous students who also make a difference. Therefore, there is a need to focus on transforming both processes and outcomes to overcome using the same old strategies and practices that have been largely ineffective and are not making a significant difference in the lives of indigenous learners.

We bring together an eclectic array of contributions that are drawn from a range of indigenous jurisdictions. These describe multiple sites of struggle to overcome the constraints of dominant colonial education and schooling, which have historically reproduced the interests of the dominant settler populations and, simultaneously, the underdevelopment of the colonized indigenous peoples. There is an ongoing need to rearticulate the shape of the collective struggle as Indigenous peoples and a need to renew the “struggle” to maintain the impetus and effectiveness of the self-development revolution. Struggle in this sense is to be seen positively. The struggle is also important as it can help us clarify what it is that indigenous communities stand for as well as what it is that they stand against. The fact that most Indigenous people remain socially and economically marginalized is evidence that selected policy formation has limited effect. This reinforces the point that no silver bullet, magic pill, or single fix-it policy exists. Instead, there is a need to invest in change on a broad range of fronts.

It is also critical to recognize that, as [Freire \(1972\)](#) noted, we need to free ourselves before we can free others. This is an important point about hegemony and colonizing ourselves by uncritically believing in and taking aboard as common sense, the colonizing rhetoric of the settler population. Transforming indigenous experience rests not just on the individual but also on families, on communities, on tribes, and on Indigenous peoples collectively. An important factor in transforming is understanding how individual conscience can join with the collective consciousness of others.

In this sense, the indigenous struggle is also for our minds. We need to understand our participation in forming our own subordination, exploitation, and oppression. We must educate ourselves about false consciousness and free our minds from hegemony. Education has been a significant factor in embedding indigenous inferiority. We must reclaim the power of education to act in our interests. An important decolonizing act, therefore, is to struggle over the meaning and intention of education and schooling. It needs to serve all peoples and not simply be a means to reproduce dominant cultural expectations at the expense of indigenous interests.

Introduction

Oppressed peoples around the world are acutely aware of the power that history education has in shaping their cultural and political identities. In his influential text, *The Mis-Education of the Negro* (1933), for instance, the renowned African American Historian Carter G. Woodson wrote of the indoctrination of Black communities led to believe they were inferior in every class they entered and every book they read (p. 2). Mis-education, for him, was much more than a contemporary critique of the system but a cycle that results from the mis-educated continuing to teach and mis-educate others. For Indigenous Māori in Aotearoa New Zealand, this deliberate mis-education—what colonizers called “civilizing missions”, “nation building”, and “assimilation”—disconnected generations from their own history, identity and language. Like other colonized and indoctrinated groups, Māori could not see themselves or their histories in schools and textbooks, and when they were included, it was through racist stereotypes and patronizing colonial lenses that dismissed their past as prehistory and superstition.

The fight to have Māori histories taught in schools and taken seriously in the field has been a long and enduring struggle. For more than a century, Māori have sought to reclaim their past “site by site under Western eyes” (Smith, 1999, 34) from the hegemony and racism of an ongoing colonizer education system and the control and cannibalism of Western-centric academic disciplines and their gatekeepers. Since the arrival of Europeans, Māori have consistently embraced and experimented with new ideas and approaches to history but have always maintained their own pedagogies and key concepts about the nature, form, practice and ethics of historical knowledge transmission and research. Now in the 21st century Māori are beginning to see small incremental changes, albeit carefully controlled by those fearful of losing power. Nevertheless, together with non-Māori allies there is a developing public discussion about the need to address our shared and unresolved colonial trauma by teaching all New Zealanders the Indigenous histories of these lands, seascapes and peoples—to remind them where they are and that the Indigenous owners of these territories are still here. In 2019, the New Zealand government after years of petitions and protests finally announced plans to reset the National History Curriculum (yrs 1–10) for 2023. It was met with a mixture of cautious optimism and the expected racist backlash, but the struggle to reach this moment has taken generations of activism, conversations, contests, and a major rethinking of what history is, who it belongs to, how to research and teach it, and how it might yet heal our present and future.

The indigenous past was never the colonizers pre-history

History did not arrive in Aotearoa New Zealand with Europeans. The hundreds of years of prior Indigenous experiences are legitimate histories, and not the prelude or prehistory of a settler nation-making story. For centuries Māori taught their own history at home, out gardening, at funerals, while fishing, and in schools of learning called wānanga. These schools often held an explicit disciplinary focus on strategic warfare, agriculture, medicine, carving, and genealogy, and all transmitted local history and cultural politics. Through each generation, wānanga carried the “historical curricula of the tribe” and remains a practice in higher learning today across the country. Wānanga were more than simply curricula or content, but have been described as “a meditative practice, a pedagogy and discussion that encourages debate, dissent and critical analysis” (Mahuika and Mahuika, 2020). Māori kept wānanga as a practice and form of instruction, and it was a subject of some interest among early European ethnographers. Pākehā author Stephenson Percy Smith, for instance, wrote two volumes of *The Lore of the Whare Wānanga* in 1915 which became “the popular and state approved history of Pre-European Māori and Moriori” in the early 20th century (Anderson, 2014, 52). Smith’s Euro-centric interpretation of Māori history as “lore”, however, did not stop most non-Māori from dismissing local histories as merely myths and the puerile imaginings of the natives. Nevertheless, wānanga survived the establishment of Native Schools and the advent of the national public education system in New Zealand and is still practiced today by both Māori and now non-Māori. Indeed, most present-day tertiary institutions in Aotearoa commonly use the name wānanga in their titles. It is important to note that history was not only taught in wānanga, but transmitted within families in multiple ways through songs, stories, proverbs, and various artforms. Māori maintained an oral history where memorization was key to the learning of whakapapa (genealogy), the

stories of ancestors, practices, places and key turning points for each tribe. The past was woven, carved, performed, practiced, recited and lived by a chorus of storytellers who placed a high value on a persons’ ability to remember and narrate the collective experience of the tribe. To be a historian—a keeper, storyteller, and educator of the past—was a crucial and tapu role in Māori society held by women, men, weavers, singers and experts of various ages and backgrounds.

Māori schooling and history teaching looked very different from the European educational institutions that arrived with Pākehā in the early 1800s. Mātauranga Māori (Māori knowledge), and historical knowledge especially, were taught through games and hui (meetings), usually by the students’ whānau and hapū (family and extended kin). Children were taught culture, customs and history using key concepts in the Māori world such as tikanga, whakapapa and whānaungatanga (Hemara, 2000). In 2015, a group commissioned by the Ministry of Education wrote briefly about some of these concepts in *Te Takanga o te Wā* (Tamua, 2015) a booklet meant to assist teachers with an introduction to teaching Māori history.

When missionaries and books arrived in the early 19th century, Māori were highly receptive to reading and writing, and this new technique of remembering and collecting historical information developed, with many families keeping genealogy books and often treating them as sacred objects and treasures. Thus, the teaching of history in Aotearoa changed with the arrival of Europeans, and particularly Christianity, but it did not eradicate past practices and beliefs attached to the keeping of the past. Instead, Māori sought to “renegotiate” (Kaa, 2020) their mātauranga and embraced new ways to transmit history, enhancing their ability to share knowledge on their own terms.

Mission schools set about “civilizing” the local Indigenous population, hoping to facilitate the “Europeanizing of Māori” and their history (Simon and Smith, 2001, 3). The first mission school in New Zealand was established by Thomas Kendall at Rangihoua in 1816. Other schools soon followed, and during that period Māori embraced literacy and were avid readers of the Bible (McRae, 1997). Many of those who had attended mission schools returned to their villages and established kura (schools) in their own communities (Barrington and Beaglehole, 1974). Mission schools were eventually replaced by a Native Schooling system introduced by the Native Schools Act in 1867. According to James Belich the official policy toward Māori during this period (1814–1860) “was to convert them into Brown Britons” (cited in Simon and Smith, 1998, ix). By the 1860s, violent British colonial invasions in the Waikato region and wide-spread raupatu (land confiscations) emptied out mission schools around the country and left the government with very low educational expectations for Māori (not that they held high expectations at the time). In an 1862 report, Māori were viewed as better suited to “manual” rather than “mental labor” (Taylor Report 1862), and while the Education Act 1877 made provision for the first national curriculum, Section 81 (4) of the Act specified that “if history was taught, only English history was to be transmitted.” This remained the norm for history teaching up until 1904 when a new primary schools syllabus added New Zealand history content that was often ignored by teachers anyway (Manning, 2017, 121).

The myths we lived by

From the 1880s, newly appointed Native School teachers were expected to be “familiar with the discovery of New Zealand” and “the history of the land wars” which many taught as a triumphant and romantic account inconsistent with Māori histories of the same conflicts (Barrington & Beaglehole, 7; Manning, 121). This settler myth of peaceful settlement endured for so long it was alarmingly regurgitated by National prime-minister John Key in the early 2000s. The erasure, retelling, and mis-education of Māori and New Zealand history impacted all New Zealanders since the 19th century who were led to believe a range of myths about Māori history and the country’s colonial legacy. One longstanding myth described Māori navigation to Aotearoa as accidental, claiming Māori ancestors drifted haplessly and made landfall emaciated and starving. This was challenged decades later by scholars like Ranginui Walker who noted how the maritime achievements of Polynesian peoples in the Pacific had been “denigrated and romanticized” for too long (Walker, 25–26). A number of studies in the second half of the 20th century clearly demonstrated that traditional double hulled vessels were not only expertly sailed by Polynesian seafarers but that these skilled navigators traveled back and forth across the Pacific in multiple voyages.

Māori were also said to have arrived in one great fleet, a view popularized by Stephenson Percy Smith at the end of the 19th century. In one school text from 1960 it was suggested that Kupe discovered New Zealand about A.D. 950 and was followed by later explorers like Toi and a major migration about 1350 (Anderson, 52). The great fleet myth survived for some time until it was disproved by David Simmons extensive research in the 1960s and widely rejected by historians (King, 2004, 45). Yet another myth claimed that Māori were not the indigenous peoples of New Zealand at all and were in-fact responsible for the genocide of an earlier group, Moriori. This narrative was published in school journals in the early 20th century by Percy Smith and Elsdon Best and made its way into a 1934 school reader, *The Coming of the Māori to Ao-tea-roa*, published by A. W. Reed. It was later refuted by numerous scholars including H. D. Skinner, Roger Duff, and Michael King. King writes that “despite this overwhelming volume and weight of testimony some late 19th and early 20th century scholars convinced themselves and a gullible New Zealand public that Moriori were not Polynesian” (King, 2004, 55–56).

The undermining of Māori indigeneity and history has taken various mis-educated forms, and perhaps none more subtle than the reduction of the Māori past to prehistory. A range of history texts, including Keith Sinclair’s mid-20th century book, *A Destiny Apart* (1986), chaptered pre-European contact experiences as “Prehistory”, a precursor to the more important story of the nation. Māori have strongly rejected that idea as have most New Zealand historians today (King, 2001, p. 7). This mis-education of basic New Zealand history was notable in recent debates regarding the TUIA250 celebrations in 2015 (<https://mch.govt.nz/tuia250>),

a commemoration to the country’s “discovery”, that found its’ date in the arrivals of European explorers James Cook and Abel Tasman, unsurprisingly at the expense of earlier Māori navigators and discoverers.

The reduction of the Māori past to prehistory reflected the underlying tenets of a discipline grounded in Western historical methods and concepts. The professional History that arrived in New Zealand during the 19th century carried with it specific standards developed by Leopold Von Ranke and other historians between 1824 and 1871. Legitimate history, according to these standards must be based in verifiable objective empirical sources that rejected Indigenous oral histories as untrustworthy. This focus on narrow empirical evidence remained dominant in history teaching for the entire 20th century, despite arguments from scholars such as Jan Vansina, who argued for the viability of oral traditions as history (Vansina, 1985). Despite his optimism, Vansina maintained that oral histories should still be verified by Western historical methodology. But for Māori historians and scholars, like Ruka Broughton, tribal oral history and traditions were robust and contained “much that can be regarded as factual whether biological history” or genealogical (Broughton, 1979, 6).

Māori consistently challenged the displacement of their past throughout the 20th and early 21st centuries, with iwi and Māori activists, leaders, and historians opposing the insidious nature of this colonial mis-education (Mahuika, 2009). Writing on this issue to his friend Apirana Ngata in 1931, Māori leader Te Rangihira (Peter Buck), for instance, insisted:

Kua mutu te wā ki a Te Peehi ma, kua riro ma tāua, ma te Māori, tāua kōrero / The time for Best is over, we as Māori should take responsibility for researching our world for ourselves. It is left to us to straighten up what has been written by our Pākehā pioneers.

Cited in Sorrenson (1987).

Increasingly, Māori and non-Māori scholars challenged not only the content of popularized colonizer histories, but the underlying tenets of the discipline that delineated the field in explicitly non-Māori ways. Like Ngata and Buck, Hirini Moko Mead, several decades later in 1977, pointed out how Pākehā had for too long been “reaching into Māori culture and pulling out the features with which they can identify, taking hold of quite generous portions which they then try to fit into a Pākehā cultural world” (Mead, 1977). Māori organizations, like the Māori Women’s Welfare League, also challenged Government policy regarding the place of te reo and the teaching of Māori history in schools during the 20th century (Harris, 2004, 44). This activism, connected to protests of the 1960s and 1970s, disrupted the idea of New Zealand’s world leading race-relations mythology and reframed discussions around significant histories such as the Treaty of Waitangi and the 19th century Land Wars.

In reclaiming the past, Māori were keen to correct historical myths that perpetuated colonizer-centric stories, like the idea that Māori simply ceded sovereignty to the Crown and welcomed their own assimilation (Jackson, 1998, 73). This also meant challenging the power and place of Pākehā historians, like Michael King, who had set themselves up as experts on Māori history much the same as Elsdon Best and Percy Smith had decades earlier (Mahuika, 2011). This ownership of the past remained an ongoing discussion, with tribal scholars like Keri Kaa arguing that “for years we have provided academic ethnic fodder for research and researchers. Perhaps it is time we set things straight by getting down to the enormous task of writing about ourselves” (cited in King, 1999, 184). This led to questions about who can do Māori history? On this issue of ownership in the late nineteen eighties, Ngai Tahu leader, Sir Tipene O’Regan argued that “the past belongs to all New Zealanders, but first it is ours” (O’Regan, 1987). For Māori and iwi people, it was always a matter of ethics. Māori have pointed out that non-Indigenous peoples can do this work, but not by themselves; and would need to position themselves as non-Māori and be accountable to local communities (Mahuika, 2015). For many Māori, non-Indigenous researchers who built careers off the back of native peoples did more damage than good, despite self-serving arguments that their work rescued Native history from extinction. This question of ownership and access remains an ethical problem, evident in the critiques of Pākehā historian Paul Moon by Māori scholars today who have pointed out his Eurocentric mis-interpretations of their history and lack of appropriate Indigenous research ethics (Tau, 2009; Karere, 2018).

In 1992, Māori formed a national collective only for Māori and iwi historians called Te Pouhere Kōrero. It serves as a space for Māori to discuss the past away from Pākehā dominated forums like the New Zealand Historical Association (NZHA). For the last thirty years, several historians within this cohort have produced important work about the practice and nature of Māori history. These included important insights about the nature, form, ethics and practice of Māori and iwi histories. One of the ongoing issues has been the reduction of Māori history to overly-simplistic generalizations of Māori people. By the end of the 20th century, Māori scholars had adamantly argued that their histories should not be seen through a singular homogenous frame but are better understood from tribal perspectives. Tuhoe scholar, John Rangihau famously asserted, for instance, that “[m]y being Māori is absolutely dependent on my history as a Tuhoe person There are so many aspects about every tribal person. Each tribe has its own history. And it is not a history that can be shared among others.” (Rangihau, 1992, 190). This was reiterated by Tipene O Regan, who argued that the “psychological base of a Māori view of the past is both personal and tribal. It is intimately related to one’s notion of self” (O’Regan, 142).

Māori historians have consistently argued that their past should not be taught as merely colonial history, ignoring hundreds of years of nuanced historical experiences beyond the binaries of the colonized and the colonizer. Tribal scholars, for instance, have debunked the notion that 19th century Māori can be defined as either loyalists or rebels. Loyalist or “Kūpapa” were terms imposed on Māori historical subjects by non-Māori historians, effectively locking them into colonial nation-making binaries. In his biography of Rapata Wahawaha (Soutar, 2000), Ngāti Porou historian Monty Soutar convincingly showed that Wahawaha was by no means a loyalist and had been wrongly identified as Kūpapa. Likewise, in a recent study (2020), Denize Ewe also showed

that Ngāti Tipa leader, Waata Kukutai was inappropriately considered a loyalist Kūpapa as well, when like Wahawaha, Kukutai made decisions for the benefit of his people, not the Crown. This reclaiming by Māori historians disrupts longstanding myths that portrayed Māori resistors as violent rebels, blood thirsty warriors, and in more recent times as “wreckers and haters” or “terrorists” while colonial invaders were cast as the nation’s discoverers, settlers, pioneers, leaders, and citizens.

In challenging the mis-education of history in Aotearoa, Māori have tirelessly asserted the value and crucial importance of local Indigenous knowledge or “mātauranga Māori” (Ruru and Nikora, 2021). Mātauranga Māori, according to Rawiri Te Maire Tau “is simply the epistemology of Māori—what it is that gives point and meaning to Māori knowledge”. Tau questioned whether the Western dominated discipline of history is the right place for that knowledge, as it has often “twisted” mātauranga beyond anything our experts ever anticipated (Tau, 2001, 67–68). This is a common theme for Māori activists and scholars, with explicit concerns about the so-called rigors of empirical science which allowed Māori history and identity “to become the plaything of historiographers” (O’Regan, 141).

In more recent years, Māori have argued that those who research and teach history in Aotearoa must develop a stronger understanding of the way Māori conceptualize and practice the past. Māori, for instance, see viable historical sources as much more than rigidly empirical written documents. Objectivity in research is also not the driving goal for Māori historians or researchers who highly value the nuance and ethics in subjectivity. Like oral historians across the world, Māori have argued for the value and validity of oral sources, and indeed multi-sensory sources that are used to story the past (Mahuika, 2009, 2017). For Māori, genealogy or whakapapa is a key component in the way they conceptualize and structure history. Thus, while mātauranga Māori is seen by some as the appropriate place for history, whakapapa is seen by many as “the skeletal structure to Māori epistemology” (Te Maire Tau, 67–68). When non-Māori researchers arrived in Aotearoa, they gathered genealogical data, much of it through the Native Land Court system, and this became the basis of a number of written tribal histories. W. E. Gudgeon, a Native Land Court Judge and part time historian, for example, advocated arranging tribal histories and genealogies into a single history of Māori (Anderson, 52), while Sir Apirana Ngata experimented with the use of Western genealogical methods in the teaching of East Coast histories (Mahuika and Mahuika, 2020).

Like other Indigenous peoples, Māori also see time in a different way to the normative linear approaches introduced and normalized in schools and Western history (Marker, 2011). Māori histories are not simply linear, but can be circular, and understood through different conceptions of wā (time) and maramataka (lunar calendars). Some have argued that “Māori culture” is more “event time” driven rather than clock time oriented (Lo and Houkamau, 2012, 109). Māori have also widely rejected the argument made by those who suggest good objective history should avoid a presentist outlook—and not be impacted by present day perspectives and ideas (Williams, 2014). For Māori, however, the past is regularly seen as part of the present and collapsed as the narrator “walks backward into the future” (Rangiwai, 2021) and carries with them their ancestors’ stories. History is not a foreign country for Māori. It is a living practice deeply connected to the now.

Māori have also been outspoken about the importance of te reo Māori (the Māori language) in teaching and researching their past. In the late nineties, Monty Soutar highlighted the crucial place of language proficiency in undertaking tribal histories and the appropriate analysis of Māori historical sources (Soutar, 1996). Māori historians have been clear that New Zealand historians cannot rely on English to define and make sense of Māori and iwi histories, and that educators must grow their knowledge of te reo Māori to correctly pronounce and interpret the country’s past (Mahuika, 2015). English, as many other Native scholars across the world have argued, is a deeply problematic medium to teach Indigenous histories (Battiste, 2008, 504).

In challenging the colonial mis-education of their past, Māori have continued to illustrate how they see, teach and practice history. This includes writing about Māori history concepts (Tamua, 2015), sources and ethics (Mahuika, 2015). While these are perhaps more the interests of researchers and historians, it has been vitally important for Māori to challenge the mis-education of New Zealand’s past taught to the general public and generations of school goers. Māori have been explicitly outspoken in repeating the view that New Zealand was not settled peacefully. For Māori, settlers were invaders or at the least un-settlers, and history here should not revolve around their story of nation-building that has relegated Māori history to myths, legends, and prehistory. In reclaiming the past from colonizing educators, Māori experts have been adamant that the first law in New Zealand was Māori law not European law (Mikaere, 2005). Similarly, the first oral historians in New Zealand were not 20th century European journalists but Māori historians (Mahuika, 2017). And perhaps most importantly, the Treaty of Waitangi and its colonial past is not the focal point of iwi histories that are more interested in the storied experiences of their own ancestors, lands, rivers, and oceans.

Māori historians have been forthright in their assertions that there is no New Zealand history without Māori, and that the New Zealand narrative is only a very small chapter in a much longer and still ongoing Indigenous story (Mahuika, 2015). Unlike dominant Pākehā histories that focused on inevitable national progression, a Paradise Reforged (Belich, 2001), and a Frontier of Dreams (Dalley and McClean, 2005), Māori historians have produced much different narratives that emphasize an ongoing struggle without end (Walker, 1990), protest (Harris, 2004), and their position as the first and still native peoples or tangata whenua (Anderson, 2014).

The history curriculum reset 2023

Since the introduction of a national syllabus in 1904, Māori and iwi histories have been excluded in favor of both British and New Zealand content. History was optional in the syllabus until 1915, and for much of the 20th century the focus remained on English and settler colonial perspectives. The syllabus was revisited again in 1928 and influenced by a special committee formed in 1924.

The 1928 syllabus devoted more space to New Zealand topics but did not guarantee the incorporation of Māori perspectives (Manning, 2017). When Māori were included in textbooks, their histories reflected many of the colonial myths that Māori had sought to critique and correct for generations. From 1944, history as a subject fell under the newly introduced and compulsory social studies curriculum that added yet another layer through which Māori history would need to traverse to be seen and valued. Despite a further curriculum update in the late eighties, scholars note that New Zealand history was largely ignored by educators who preferred teaching the much less controversial 16th- and 17th-century Tudor England topic right through to 2010 (Manning, 2017). When Labor Prime Minister Jacinda Ardern announced plans for an overhaul of the New Zealand History curriculum (yrs 1–10) in mid-September of 2019, there was considerable skepticism from Māori (Loader et al., 2019).

The reset had been driven by a 2014 petition for the compulsory inclusion of the 19th century New Zealand Wars and increasing calls for New Zealanders to better understand their own colonial history. While Māori had been arguing for this for a century, there was little support from Pākehā, with “risk averse bureaucrats” and politicians too conservative or afraid to push for meaningful change despite the major shifts in bicultural education in the mid-eighties (Manning, 2017). When Māori had called for inclusion decades earlier, Pākehā Historians bemoaned the political correctness of it all, and complained that such a move would erode the autonomy of school boards to teach what they wanted. Following the 2019 announcement, Pākehā Historians like Michael Bassett complained that the curriculum advisory group was made up of “a collection of Māori radicals” with “no serious Pakeha historian in sight” (Bassett, 2021). In truth, the majority of that team were non-Māori. This gate-keeping of history education in Aotearoa New Zealand has long been dominated by “a number of high-profile academics,” none of them Māori (Sheehan, 680). And despite the energy and work around the yr 1–10 junior history curriculum, that unabashed gate-keeping is still evident in the current senior history writing group (yrs 11–13) which is still devoid of Māori historians despite calls from Te Pouhere Kōrero to Minster Hipkins and New Zealand History Association president Michael Belgrave to include Māori experts.

The struggle to have Māori history taught in New Zealand schools is as much a fight within the education system as it has been within the field of history globally. Māori historians share this similar struggle with indigenous peoples in Canada, Australia, Central, North and South America, and many other parts of the Indigenous world. In the United States, Native scholars have recently asserted that you cannot teach US history without Native Americans and have insisted that when “teachers embed Native American history more fully in the American story, students are challenged to think in new ways about larger themes in American history such as nation building, economic empowerment, citizenship and multiculturalism” (Sleeper-Smith et al., 2015). Similar work in Canada, led by First Nations scholars like Marie Battiste are also pushing for the inclusion and development of their history in local curricula.

Since the 2014 petition, there have been small advances in the inclusion of Māori history and a desire to address and decolonize the nations unresolved trauma. In 2018, for instance, the New Zealand History Teachers Association decided to change their constitution to reflect a more explicit decolonial focus and supported calls for inclusion of the New Zealand Wars in schools. The 2014 petition, and years of struggle, also led to the first Rā maumahara (commemoration day) hosted by Te Tai Tokerau iwi at Kororāreka in March 2018. It took another year for the government to officially announce that inclusion in the school curriculum. The 2022 History curriculum reset, then, has a long backstory of struggle and protest, renewed in recent petitions and largely embraced by a population more aware of the need to finally address the mis-education of their own past and not leave it simply to Māori.

Teaching Māori and iwi histories—a struggle without end

Over the past two centuries, Māori histories were deliberately excluded or misrepresented in various iterations of the history curriculum in New Zealand schools. From early mission schools (1814–1860s) to the advent of the Native School system (1867–1969), boarding schools and public schools (1877–). At all levels, History curricula and teaching favored powerfully embedded English and colonial-centric New Zealand nation-making perspectives and agendas. Māori struggled through more than a century to be in the conversation today, and to put right generations of racist mis-education about their past. The struggle was never just a matter of returning Māori history to Māori peoples, but ensuring the native history of these lands, oceans, and peoples are taught correctly to all New Zealanders today. It is a history far deeper than New Zealand nationalism and is still ongoing. European experiences and nation-state history is an only very small part of a much longer narrative that explicitly tells all those in Aotearoa how their local areas were named, and what it means to belong here—what it means to truly be native.

Like Māori, all New Zealanders were mis-educated across the 20th and early 21st centuries in ways that made it much harder for Māori to claim their historical knowledge as valid and reliable. That mis-education also proved a significant barrier for Indigenous people who became disconnected from their culture, language and history because they were unable to see themselves beyond the stereotypes and myths taught in schools. This led to generations of depression, poor health, resentment, anger, and unresolved trauma.

There is still significant concern about a new curriculum for 2022 and whether it will simply progress the state objective to assimilate Māori history into the well-funded and ever-present overarching power narrative of national becoming and progress. Despite the inclusion of Māori perspectives and content, the curriculum is still wedded to the idea of nationhood and is still controlled by a government that continues to assimilate local Indigenous peoples within their own historical articulation of one people. The struggle to re-educate the general population and fight for the right to define themselves, therefore continues for Māori and now for all New Zealanders. It is, much as Ranginui Walker once observed in his famous history, *Ka Whawhai Tonu Matou*, a struggle seemingly without end.

Introduction

The paper engages narrative storytelling, a process that privilege Aboriginal knowledges and worldviews while celebrating how Indigenous peoples create and share knowledge. My interpretation of narrative storytelling is influenced and shaped by the work of Jo-ann Archibald, who, when writing about Coyote the Trickster posits that the Trickster learns lessons “the hard way.” Archibald writes: “The Trickster stories remind us about the good power of interconnections within family, community, nation, culture and land” (Archibald, 2008, p. i). Archibald adds: “If we become disconnected, we lose the ability to make meaning from Indigenous stories.”

Tensions emerge in my narrative storytelling due to my use of the language of the coloniser to create and share meaning. This is compounded with the loss of my Gumilaroi language with the use of dominant cultures’ academic and literary standards creating a type of conformity and hegemony, within which I risk the loss of my authentic Aboriginal voice.

Thinking Gumilaroi and writing in the colonisers language is both a constant, and at times debilitating challenge. Why do I write and for whom? I often feel as if I’m losing something or surrendering my voice when I write using a style that is entrenched in and privileges the dominant culture.

I find myself wondering, is this why Indigenous movie makers and those involved with the creative and performing arts are so successful at their craft? In these fields they are less bound, or at least enjoy a certain freedom, enabling them to tell their story unencumbered by western dictates and conventions.

The haunting lyrics of Aboriginal storyteller, songwriter and entertainer, Kev Carmody reflect this freedom in his seminal song “Can Not Buy Our Soul.” Carmody’s lyrics remind us that oppression and hegemony is ever present but that we must never sell our soul nor should we ever surrender to injustice.

For 200 years us blacks are beaten down here too long on the dole

My dignity I’m losing here and mentally I’m old

There’s a system here that nails us and we’re left out in the cold

They took our life and liberty friend but they couldn't buy our soul

Joe Hill died, Che Guevara fought and Pemulwuy lay down dead

If a person speaks out critically here you can get loaded down with lead

How long can the majority wait for their story to unfold

They took life and liberty friend but they could not buy our soul

The cleverman spoke precisely, humanity he said was done

It's creed of greed could not proceed if our struggle's to be won

For humanity's more important here than that constant quest for gold

You may take life and liberty friend but you cannot buy our soul

Jesus woke one morning, rode a donkey up through the gate

He could see quite clearly he was going to face his fate

And the powers that be, could see that he, could not be bought or sold

They took his life and liberty friend but they could not buy his soul. (2007)

Addressing the tension of writing across cultures and ontologies, Nunga academic Irene Watson pondered: "Lately I have reflected a lot on why and how I speak, and write and that is because I feel a pressure to perform. Why do I feel this pressure to perform, and in what context do I feel it? In this one. The pressure is to locate myself within a space where the muldarbi has been working for centuries in dismantling my Nunga being.¹ The risk of entering this space is to become assimilated by the muldarbi, the challenge is to survive and remain a Nunga" (Watson, 1998, p. 28).

Aboriginal educator, researcher and scholar, Dr. Nerida Blair also writes of this tension in her book, *Privileging Australian Indigenous Knowledge: Sweet Patatoes, Spiders, Waterlilies and Brick Walls* (Blair, 2015). Blair shares:

Much of our energy as Indigenous peoples has been trying to 'fit in' to the Western Eurocentric system or fight being 'fitted in' by Eurocentric scholarship (Kovach, 2009, p. 31) Wilson (2008, p. 127), Arbon (2008, p. 27). I liken this to one of those boxes a lot of young children had in schools, at home to learn shapes, colours and numbers. The box was rectangular. The box has a number of different shapes cut into it; triangle, circle, square. The child has

¹Muldarbi: Demon Spirit.

a corresponding shaped block to fit into the shape in the box. If we as Indigenous peoples are diamond shape you can eventually fit us into every shape in the box. At what cost? How much of our exterior shape is rubbed raw in an effort to make us 'fit'; hammering, twisting, manipulating? Another word for this is assimilation.

(Blair, 2015, p. xix).

Similarly, Arbon (2008) argues that:

Aboriginal existence continues in a desperate struggle as empire manifests locally through a colonialism that demands homogeneity in most all undertaken in Indigenous lives.

(Arbon, 2008, p. 134).

Like, Watson, Blair, Arbon and others, I choose to speak and write my truth, albeit through the medium of the language of the coloniser, because Aboriginal voices have been silenced for far too long. I also choose in this paper to use my own narrative style within the boundaries and constraints of writing through the medium of the coloniser. When Indigenous peoples share our stories they are often misinterpreted, relegated and subjugated to a place where meaning is viewed by settler societies and defined as mere folklore and mythology. Voices that are steeped in Aboriginal culture and experience must be liberated and asserted if real and sustainable change is to occur in education and other areas of Aboriginal need. Aboriginal voices are critical in that place where truth and truth making reside so that a more equitable and respectful world of diversity and difference is realised.

Through my narrative storytelling I invoke 5 decades of experience in visioning, policy writing, managing teams and structures, facilitating community-led processes, empowering community-engagement in what is referred to as Aboriginal education. The valued voices of others are present in this journey and they are celebrated and woven into my narrative storytelling.

A central theme of the paper is that education failure levels currently experienced by a significant number of Aboriginal learners, particularly at the schooling level of education, should be viewed essentially as a rejection by Aboriginal learners of the assimilationist imperatives embedded in Eurocentric education systems.

Addressing assimilation and hegemonic forces embedded in Eurocentric education, Battiste (2000) argues ... "that Aboriginal people have been subjugated by the military, political, and economic systems, but the most effective oppressive attack on First Nations cultures has been the education system." Battiste adds: "the subtle influence of cognitive imperialism, modern educational theory and practice ... destroyed or distorted the ways of life, histories, identities, cultures, and languages of Aboriginal people" (p. 193).

This rejection by Aboriginal learners of the assimilationist imperatives, rooted as they are in Eurocentric cultures and ontology, are especially evident among Aboriginal learners who are strongly connected to their culture, their traditions, know their country and secure in their identity. Understanding what the existential essence of connection to country means for Aboriginal people is complex but it should never simply be interpreted as involving geography. Aboriginal people's connection to country, including lands, waterways, seas and sky involves symbiotic principals of custodianship, law obligation and accountability, spirituality, and kinships forged over thousands of years. Country is the library where hundreds of generations of knowledge and Aboriginal wisdom resides.

It is argued that achievement levels will not improve at the schooling level of education for the vast numbers of Aboriginal learners until they see themselves and their people positively and affirmingly in the curriculum they engage. This will require systems and the teachers who work within them, to be trained, untrained and retrained to ensure that this concept of country, and all that it involves, informs curriculum content and a culturally affirming and rights based pedagogy.

Providing a more nuanced definition of this assertion, Professor Lester - Irabinna Rigney uses the term "Indigenist epistemologies" to identify and define what he calls "provocations." These provocations are: privileging Indigenous voices, upholding integrity of cultural knowledges to resist hegemony, and empowering self-determination (Rigney, 2001).

The provocations cited by Rigney and a rights-based Aboriginal education pedagogy, are viewed as pivotal to constructing a more culturally affirming and responsive pedagogy and epistemology of Aboriginal education.

This paper builds on and supports the work of others who are challenge the assimilationist and hegemonic forces of Eurocentric education systems and their persistent failure to accommodate Aboriginal cultural and education rights and aspirations. This failure to accommodate is compounded by the compulsory nature of schooling in Australia. The compulsory requirement attached to schooling in Australia has been something that I've grappled with over the years because if it is compulsory for Aboriginal kids to attend school then surely there is a duty of care and obligation for schooling to accommodate and pay respectful attention to the culture and life circumstance of the kids who are compelled to attend government and other schools.

Dedication

The paper is dedicated to the tireless efforts of Aboriginal education warriors, parents, community members and the non-Aboriginal supporters who stand with Aboriginal people against oppression and who demand that historical wrongs are righted and that current inequities are corrected.

Some of these young warriors are gifted and culturally grounded but many lack the experience to withstand the seductive and hegemonic forces of the systems they are employed within, including education. In this context, the young ones are all too often expected to comply with Eurocentric education objectives and are advised to focus primarily on student attendance and behavioral matters thereby leaving curriculum content, assessment methods and teaching methods and other matters to others. Of course, the young ones work with others to address all these matters but they also understand that they have a duty of care to ensure that systems respect and accommodate their cultures, experiences and worldview. Navigating this terrain involves walking a tense tight-rope between systemic expectations and community and cultural obligations.

Illustrating the tension inherent in this terrain, I was recently invited to meet with a group of young Aboriginal educators employed with the NSW Department of Education and some of them shared that they constantly struggle to guard against implied and often explicit assimilation and social reproduction imperatives. These are young people who simply want to serve their community, live life with dignity and to provide for their family and kin without having to constantly fight against the assimilationist and hegemonic forces of the education system they are employed within. Eurocentric and assimilationist systems can be seductive, especially for isolated Aboriginal employees and those disconnected from country, kin and community.

Ironically, as is the case with many Aboriginal people in similar positions based in majority cultures and systems, members of this group of Aboriginal people were employed in “designated” or “identified” positions meaning that their cultural background and experience, it is expected, would position them to provide an Aboriginal voice and advocacy across the scope of their identified duties. However, some of these young ones reported that they were increasingly expected to attend to duties in a way that totally ignores and confounds the purpose for which they were employed. To paraphrase Dr. Eber Hampton, past president of the First Nations University in Regina, Saskatchewan, Canada, many of these young ones were expected to employ “Anglo methods to satisfy Anglo education purposes” (Hampton, 1995).

The young ones reported that they are increasingly forced to withstand the pressures to embrace and conform to non-Aboriginal assimilationist objectives, often resulting in burn-out or what I refer to as spiritual fatigue (Morgan, 2020). The young ones reported that they have no one to turn to for cultural and professional advice and support within the system, and if it does exist, it is often in the form of non-Aboriginal senior staff with limited knowledge of the young ones culture, community and country.

The young ones were advised to never surrender to or to be silent in the face of injustice. That they should strive to honor those on whose shoulders they stand; because to surrender, or to be silent, simply empowers the system.

This workplace tension has been there for many years and it has never been adequately addressed, forcing many of the young ones to surrender or seek employment in more culturally safe working environments. Of course, they have other obligations beyond their connection to culture, kin and country including rents or house mortgage and rental payments, car payments, and other living expenses so employment is critical to meeting these obligations, but at what a cost?

Culturally grounded Aboriginal people are better equipped to understand and therefore better able to function in this space compared to Aboriginal people whose identity is simply defined and informed by heritage.

“Heritage Aboriginal people” are those who I argue have little understanding of their country, kinship structures and obligations, they lack knowledge of language and other lessons derived from timeless song-lines, oral traditions and cultures that have sustained Aboriginal people for countless generations.

Heritage Aboriginal people merely connect through often ill defined or ambiguous heritage and are often unable to identify, precisely, the Aboriginal nation they reportedly draw their heritage from. Heritage Aboriginal people have rarely sat on country to engage with the old ones so that a more profound level of understanding is developed of critical matters that would define and inform their identity. Conflating heritage with genuine community, kinship and country based Aboriginality is highly problematic and insulting.

Ethnic fraud

Heritage Aboriginal people are different from culturally grounded Aboriginal people but there is another rapidly increasing group who fraudulently claim Aboriginality for the purpose of a perceived or real benefit, a benefit that is designed to address Aboriginal disadvantage and marginalization. This form of “ethnic fraud” is of considerable concern within Aboriginal communities and recently led to two NSW Local Aboriginal Land Councils (LALCs) submitting a formal complaint and request for an investigation by the NSW Independent Commission Against Corruption (ICAC) of perceived practices of ethnic fraud involving staff and students at one of Australia’s most prestigious higher education institution, Sydney University. (See “The Australian”, Thursday, November 25, 2021.)

While ethnic fraud might be considered, by some, to be extraneous to the right of Aboriginal people to access a rights-based education, ethnic fraud, left unchallenged, distorts and belittles genuine attempts of Aboriginal people to overcome long denied access to services and programs that are generally enjoyed by mainstream Australians. If left unchallenged, ethnic fraud also provides the opportunity for individuals who have used ethnic fraud to gain academic qualifications, and other advantages, to obtain positions where they can influence and shape public, institutional and corporate policy.

The Australian Government Productivity Commission

The report of the Australian Government Productivity Commission “Overcoming Indigenous Disadvantage: Key Indicators 2020” was released on December 3, 2020 (SCRGSP, 2020). The report measures the wellbeing of Aboriginal and Torres Strait Islander people and it is illuminating to note some of the statistics relative to Aboriginal and Torres Strait Islander education. The Productivity Commission reports:

This comprehensive report card measures where things have improved (or not) against 52 indicators across a range of areas including governance, leadership and culture, early childhood, education, economic participation, health, home environment and safe and supportive communities. The report includes case studies on governance, with a specific focus on identifying arrangements that support shared decision-making between Aboriginal and Torres Strait Islander people and Australian governments.

(Australian Productivity Commission, 2020).

Reading, writing and numeracy performance for Aboriginal and Torres Strait Islander students was reported thus:

Results for this indicator have fluctuated over time with no clear trend. Comparing 2008 and 2019, the proportion of Aboriginal and Torres Strait Islander students achieving national minimum standards increased for Years 3 and 5 for reading, and for Years 5 and 9 for numeracy. However, volatility in the data means conclusions drawn from comparisons should not be interpreted as consistent improvement over time.

(Australian Productivity Commission, 2020).

Addressing Year 1–10 attendance pattern data the report states:

In 2019, the overall attendance rate for Aboriginal and Torres Strait Islander students was 82 per cent, a decrease from 84 per cent in 2014.

The attendance rate for non-Indigenous students was 92 per cent in 2019.

The proportion of Aboriginal and Torres Strait Islander 20–24 years olds completing year 12 or equivalent or above increased from 45 per cent in 2008 to 66 per cent in 2018–19. For non-Indigenous people, the proportion remained relatively unchanged (90 per cent in 2017–18).

(Australian Productivity Commission, 2020).

In relation to Year 12 attainment, it is reported that:

The proportion of Aboriginal and Torres Strait Islander 20–24-year olds completing year 12 or equivalent or above increased from 45% in 2008 to 66% in 2018–19. For non-Indigenous people, the proportion remained relatively unchanged (90% in 2017–18) (Australian Productivity Commission, 2020).

These findings are not surprising when viewed through an Aboriginal rights based lens and reflects the ongoing failure of Euro-centric systems of schooling to effectively engage Aboriginal students in learning.

In light of the findings of Productivity Commission, and numerous other factors, it is advocated that education for Aboriginal learners must be seen as a right, provided in a culturally safe and responsive learning environment, utilizing a pedagogy that emanates from and is defined by and privileges the rights and freedoms of Aboriginal peoples expressed and recognized in instruments such as the UN Declaration on the Rights of Indigenous Peoples (UN, 2007) and asserted in the Coolangatta Statement.²

This paper does not offer any easy fix or instant remedies except to stress that the existing “guest paradigm” (Morgan, 2019) of assimilation and social reproduction model of Aboriginal education is flawed. The non-Aboriginal – Aboriginal power relationship operates creating a “partnership” in which Aboriginal people have all the need but systems retain and control all the resources. This “partnership” has generated irrelevant, and in many cases alienating curricula, ill-informed teaching methods and assessment procedures, poor parent and carer engagement processes and a host of other failings.

The positioning of Aboriginal learners as alienated guests in the Eurocentric education domain must end if the learning experiences and outcomes of Aboriginal learners are to improve.

²The Coolangatta Statement (WIPCE, 2006) was initiated during the 1993 World Indigenous People’s Conference on Education (WIPCE) and ratified by the 1996 WIPCE conference held in Hilo, Hawaii in 1999. The Coolangatta Statement was one of the documents that informed the education component of the UN Declaration on the Rights of Indigenous Peoples (UNDRIP).

Moving from Aboriginal Education self-determination to education as sovereign right

Aboriginal sovereignty is not recognized in the Australian Constitution or Australian law although calls are being made for constitutional amendments that would give effect to the recognition of a form of Aboriginal sovereignty including an Aboriginal and Torres Strait Islander voice to parliament. These matters and others are contained in the Uluru Statement from the Heart that emanated from the First Nations Constitutional Convention held in Central Australia in 2017. ([First Nations Constitutional Convention, 2017](#)).

Of course, the fact that Aboriginal sovereignty is not legally recognized in Australian law does not necessarily negate or invalidate its authenticity. The recognition of Aboriginal and Torres Strait Islander sovereignty is an enabler for treaty making, truth telling and sociopolitical change. Aboriginal children who are linked to culture and country intuitively know and are reminded that they belong to the oldest continuous culture on the planet and this sovereign reality must be part of their schooling journey.

Aboriginal sovereignty involves more than a claim to Western notions of prior-existence or land ownership; at its core Aboriginal sovereignty declares and defines the symbiotic and custodial relationship that Aboriginal people have with the land, rather than over it, and this relationship continues today and will persist into the future.

Hopefully a model of Aboriginal rights based education will be part of the commitment of the newly elected Albanese federal government to the Uluru Statement from the Heart. The new Australian Prime Minister, in claiming victory in the May 2022 election declared: “On behalf of the Australian Labor Party, I commit to the Uluru Statement from the Heart in full.” (See: <https://ulurustatement.org/the-statement/>).

Elements of a aboriginal rights-based education model

Discussing a rights-based education for Aboriginal students, Professor Rigney in his paper titled “Aboriginal Child as Knowledge Producer” ([Rigney, 2020](#)) offers what he terms “provocations on the rights of the knowledge producing Aboriginal child.” These provocations include:

1. The right to Indigenous subjectivity and languages
2. The right to produce knowledge for the dimensions of sovereignty, equality, democracy,
3. Solidarity, and freedom
4. The right to produce knowledge that privilege voice, integrity of Indigenous epistemologies, and intelligences, to resist hegemony and to strengthen self-determination
5. The right to global literacies, numeracies, and enriching ideas of humanity
6. The right to have rights and dignity as a human being
7. The right to belong, become, and be different
8. The right to produce digital, relational, existential, creative, embodied, scientific, political, and economic knowledge to move fluently across cultures without compromising those of self
9. The right to ecological sustainability where all things are interconnected
10. The right to love, peace, and treaty free from racism and colonialism
11. The right to not inherit a dead planet (see [Rigney, 2020](#)).

These “provocations”, and others, must form the basis for a new rights based and informed Aboriginal education policy and pedagogy.

Rigney’s work and the work of others, offer a fundamental lesson advocating that education for Aboriginal peoples will be better and more effectively addressed when Aboriginal people are directly engaged with and control its nature, scope and purpose. This “pedagogy of engagement” is a clear manifestation of a rights informed theory and praxis of “Aboriginal education.”

Instruments of possible change and transformation

Various instruments have been drafted to protect and advance the rights and freedom of Indigenous peoples including the WIPCE initiated Coolangatta Statement, that was used as a key document to inform the drafting of the education section of the United Nations Declaration on the Rights of Indigenous Peoples ([UN, 2007](#)). UNDRIP took over 20 years to negotiate and was finally adopted by the UN General Assembly in September 2007. Australia, the USA, Canada and New Zealand were the only member states that refused to initially sign and ratify the Declaration citing that, in their view, the instrument was “unfair and unworkable” particularly in respect to Article 26, which states that “Indigenous people have a right to own and control lands they traditionally used.”

Australia finally ratified and endorsed the declaration in 2009. It is important to understand however, that UNDRIP is not legally binding and has no recognition in international law. Its validity and efficacy is left to member states to decide how, and in what form, Indigenous rights and freedoms, including self-determination and the right to education, are acknowledged, respected and accommodated.

UNDRIP addresses the principle of self-determination at article 3 and assimilation at article 8 while education is specifically addressed at article 14.

With respect to the principle of self-determination, Article 3 reads:

Indigenous peoples have the right of self-determination. By virtue of that right they freely determine their political status and freely pursue their economic, social and cultural development.

Assimilation and the destruction of Indigenous culture are addressed at Article 8 which reads.

1. Indigenous peoples and individuals have the right not to be subjected to forced assimilation or destruction of their culture.
2. States shall provide effective mechanisms for prevention of, and redress for:
 - a. Any action which has the aim or effect of depriving them of their integrity as distinct peoples, or of their cultural values or ethnic identities;
 - b. Any action which has the aim or effect of dispossessing them of their lands, territories or resources;
 - c. Any form of forced population transfer which has the aim or effect of violating or undermining any of their rights;
 - d. Any form of forced assimilation or integration;
 - e. Any form of propaganda designed to promote or incite racial or ethnic discrimination directed against them.

Article 14 addresses the right of Indigenous peoples to education and states:

1. Indigenous peoples have the right to establish and control their educational systems and institutions providing education in their own languages, in a manner appropriate to their cultural methods of teaching and learning.
2. Indigenous individuals, particularly children, have the right to all levels and forms of education of the State without discrimination.
3. States shall, in conjunction with indigenous peoples, take effective measures, in order for indigenous individuals, particularly children, including those living outside their communities, to have access, when possible, to an education in their own culture and provided in their own language.

As previously argued, the effectiveness of these types of instruments are only as good as the respect and adherence they engender from nation states and dominant cultures. Sadly, history is riddled with examples of how nation states and dominant cultures have dishonoured and completely ignored such instruments as well as treaties.

A rights based education for Aboriginal people is a concept that many policy makers and non-Aboriginal education theorist struggle to comprehend. Perhaps it is because the despair and powerlessness that are born of invasion, dispossession and forced assimilation are absent from their lived experience; a virulent form of white privilege and an all too pervasive presence of wide-spread cognitive dissonance.

Eurocentric education as a tool of assimilation and oppression

The invasion of Aboriginal lands in Australia and the ancestral lands of Indigenous peoples around the globe was brutal, genocidal and relentless. With Darwinism and imperialism as their compass and conquest and domination as their social and political rationale, invading colonial forces used whatever means they considered necessary to usurp Aboriginal lands and subjugate its people. In Australia, massacres, poisoned waterholes and infected blankets were commonly used as weapons of oppression and as a means to aid in the spread of colonialism. The objective, though rarely stated, was clearly one of genocide.

Education was a tool weaponized by colonizing forces and was used as a mean to pacify and disconnect Aboriginal people from country and strip them of their cultural beliefs, rituals, customs, traditions and language. Whether it was Mission schools and the Stolen Generation in Australia, Indian Residential schools in Canada, the Indian schools in the US, the Native Schools in Aotearoa or similar experiences of other Indigenous peoples in other countries, each institution was established and operated clearly with a singular objective – forced assimilation. This is best captured in a statement made to American reformers in 1892 by Richard Pratt, head of the Carlisle Indian School when he argued: “Kill the Indian ... and save the man” (Pratt, 1892).

Aboriginal Education as social reproduction

The Council of Australian Government’s (COAG) National Education Agreement states that an agreed goal of schooling is that:

... all Australian school students acquire the knowledge and skills to participate effectively in society and employment in a globalised economy. (SCRCSP, 2010).

Tensions arise from this goal for Aboriginal students and their parents and communities when issues of racism, poverty, social inequalities and other marginalizing factors are understood as being present in the education journey of Aboriginal students.

Existing Aboriginal education interpretations are primarily structured so that they are fused onto white, Eurocentric knowledge systems that are fundamentally mired in and privileges what French sociologist and cultural theorist Pierre Bourdieu refers to as “education as social reproduction.” In a Bourdieuan view, education system, and more importantly, the curriculum that reproduces the dominant paradigm of inequalities ensures the continuation of conformity and disempowerment of socioeconomically and politically marginalized groups (Bourdieu and Passeron, 1977).

A balanced and synergized pedagogical model incorporating predominantly Aboriginal and a selection of aspects of non-Aboriginal knowledge from the majority culture domain, absent notions of social reproductions, is critical to providing Aboriginal learners the opportunity to develop the knowledge and skills necessary for living “a good life.”³

Unfortunately, there are no visible signs that this will happen anytime in the foreseeable future especially in light of what appears to be a shift to a corporate model of education administration in NSW and perhaps across Australia.

Global Indigenous Education sites of struggles

Indigenous peoples around the world have steadfastly held to their sovereign rights and freedoms, including the right to determine the nature and scope of the education systems that Indigenous people access and participate in. But colonial and settler forces have also held tenaciously to their power and privilege to control “Aboriginal education.” A brief and cursory analysis of “Aboriginal education” experiences in Australia, exhibits a journey of denied potential and what noted Maori scholar, Graham Hingangaroa Smith (2015) refers to as “sites of struggle.” Sites of struggle are manifest in the rejection of current assimilationist education in Australia and in most other global Indigenous contexts.

Canada

In Canada, the principle of Aboriginal Self Determination is manifest in the public policy on Indian education “Indian Control of Indian Education.” The policy, developed in 1972 by the National Indian Brotherhood (now the Assembly of First Nations), was a direct repudiation of the Canadian government’s White Paper on Indian Issues that included plans to abolish the Indian Act and promoted the notion that there should be no special status for Canadian First Nations peoples.

Discussing Indian rejection of the White Paper, Barman, Hebert and McCaskill (eds.) in *Indian Education in Canada: The Legacy* (1986) explain:

Indian reaction to the White Paper was overwhelmingly negative, Indian groups coalesced in opposition, the proposal being seen as a mechanism for the federal government to escape from its historical responsibility for Indian affairs, including the obligation to right past injustices in such areas as land claims and treaties.

In his book; “*The Unjust Society: The Tragedy of Canada’s Indians*” the late celebrated Indian leader Dr. Harold Cardinal, wrote:

The history of Canada is a shameful chronicle of the white man’s disinterest, his deliberate trampling of Indian rights and his repeated betrayal of our trust. Generations of Indians have grown up behind a buckskin curtain of indifference, ignorance and, all too often, plain bigotry. Now, at a time when our fellow Canadians consider the promise of a Just Society, once more the Indians are betrayed by a programme which offers nothing better than cultural genocide. (Cardinal, 1969, cited in Petten, 2017)

Cardinal described the Canadian Trudeau liberal government’s plan for Indian affairs as nothing more than a “thinly disguised program of extermination through assimilation.”

In his paper, titled “*Toward a Redefinition of Indian Education*” Hampton writes of Indian education experiences that are reflected in other Indigenous people’s experiences around the globe. This history and current realities indicate that the erasure of systemic education failure for Aboriginal peoples will only occur when Aboriginal people are in the position to shape the educational journey of Aboriginal learners. Aboriginal learners need to see themselves in the curriculum they engage and teachers must be trained, untrained and retrained to ensure that this is central to the learning journey of Aboriginal learners.

A rights-based system of education parallels what past president of the First Nations University in Saskatchewan, Dr. Eber Hampton describes as “*Schooling for Self Determination*” (Hampton, 1995).

Hampton contends that the term “Indian education” has five interpretative meanings, (1) Traditional Indian education, (2) Schooling for Self Determination, (3) Schooling for assimilation, (4) Education by Indians, and (5) Indian Education: *Sui Generis*.

³The concept of living “a good life” was shared by noted Yup’ik anthropologist and educator the late Dr. Oscar Kawagley during a private conversation during the 2010 American Education Research Association conference held in San Diego, California, USA. Dr. Kawagley was responding to the question: what is the main purpose of Indigenous life?.

Hampton's interpretative meaning of, "schooling for assimilation" feature in this paper. I argue that the assimilation of Aboriginal peoples was and remains the main objective of "Aboriginal education" in Australia.

Discussing Indian "Schooling for Self Determination", in his five "interpretative meanings" of Native education, Hampton advances that:

The second phase of Native education was the establishment of schools for Native children. Although schools as institutions were non-Native in origin and character, there have been vast differences in the goals, methods, and outcomes that it is possible to distinguish two kinds of schooling for Native: schooling for self-determination and schooling for assimilation.

Hampton (1995) further adds:

Although neglected in standard histories of Native education, there have been many examples of highly successful Native oriented schools. For example, schools established and controlled by the Chickasaw, Choctaw, and Cherokee nations, as well as Russian mission schools for the Yup'ik people, characterised by the use of Native languages, positive attitudes toward Native cultures, good school-community relations, and emphasise on self-determination rather than assimilation. These schools had high success rates in literacy and education attainment.

(Oleska and Dauenhauer, 1982).

Hampton shares, that these school were unfortunately closed by the unilateral actions of government.

Discussing "Schooling for Assimilation" Hampton characterizes this experience for Indian learners in the following manner:

Historically and in most contemporary situations, the education of Indians is carried out by Anglos using Anglo methods to satisfy Anglo purposes (American Indian Policy Review Commission, 1976). In contrast to schooling for self-determination, these schools for assimilation have been characterised by high failure rates in literacy and educational attainment, having assimilation rather than self-determination as goals, poor school – community relations, negative attitudes toward Native cultures, and prohibition or non-use of Native languages.

(Oleska and Dauenhauer, 1982).

Five decades after the introduction of the policy of Indian Control of Indian Education in Canada, evidence flowing from the seminal work of the Royal Commission on Aboriginal Peoples (1991–1996); and the Truth and Reconciliation Commission (2008–2015), Indian communities are beginning to slowly reap the benefits of their vision and determination. Education facilities of education excellence, as define by Indian people, such as the First Nations University (FNU) in Saskatchewan, the First Nations House of Learning (FNHL) at the University of British Columbia (UBC), The Nicola Valley Institute of Technology (NVIT), Old Sun Community College, Siksika First Nation, in Alberta and numerous other Indian controlled education institutions herald the true promise of academic success and cultural affirmation for Canadian First Nations peoples.

In Canada, as in other global Indigenous contexts, schooling has always been a site of struggle and trauma and we need to look no further than the tragedy of Residential Schools for evidence of the assimilation objective of colonizing and settler societies. What served as internment camps and masqueraded as schools, were in fact sources of pain and trauma that have scarred the lives of Indian learners and their families for generations. The recent discovery of 215 unmarked graves on the site of the Kamloops Indian Residential School (KIRS) in the Canadian province of British Columbia (BC) is distressing not only in terms of the secrecy that surrounded the circumstances of the burials but also the scale of the number of children who died in isolation and forcibly disconnected from their family and community (see Austen, 2021).

The tragic discovery of another 751 unmarked graves in a cemetery near the former Marieval Indian Residential School, north of the Saskatchewan provincial capital of Regina deepens the tragedy and signals that many more discoveries are likely to be made.

The families and loved ones of these children, some reportedly as young as 4, were denied the right to farewell their children with honor and within the traditions and protocols that govern how such ceremonies are conducted. No amount of financial compensation or apology can ever ease the painful and shameful history of the evil crimes that were committed against Indigenous peoples in the name of colonization and the settler society that have evolved.

United States of America

Indigenous peoples around the globe have suffered and seek freedom from the impact of colonialism. American Indian Nations have always asserted their right to culturally sustainable education, resolutely rejecting the assimilationist and social reproduction objectives embedded in Eurocentric education. The American Indian rejection of Eurocentric education is graphically captured in the classic statement made by an Indian leader as reported by Benjamin Franklin in 1794. Commenting upon the irrelevance and threat of Eurocentric education the Indian leader declared:

But you, who are wise, must know that different Nations have different Conceptions of things: and you will therefore not take it amiss, if our ideas of this kind of Education happen not to be the same as yours. We have had some Experience of it; Several of our young people were formally brought up at the College of the Northern Provinces; they were instructed in your Sciences; but, when they came back to us, they were bad Runners, ignorant of every means of living in the Woods, unable to bear either Cold or Hunger, knew neither how to build a Cabin, take a Deer, or kill an Enemy, spoke our language imperfectly, were therefore neither fit for Hunters, Warriors, nor Counsellors, they were totally good for nothing. We are however not the less oblig'd by your kind Offer, tho' we decline accepting it; and, to show our grateful Sense of it, if the Gentlemen of Virginia will send us a Dozen of their Sons, we will take great care of their Education, instruct them in all we know, and make Men of them.

This eloquent commentary has survived the test of time and its currency is as valid today as it was in 1794.

In more contemporary times, Native Americans continue to reject Eurocentric systems of education by asserting what is tantamount to an expression of sovereignty. This assertion of sovereignty can be found in the establishment and growth of Indian Tribal Colleges, the first of which was the Navajo Community College established in 1968. Reporting on the Tribal College movement, Ernest L. Boyer in his foreword to *Tribal Colleges-Shaping the Future of Native America*, (1989) made the following observation.

For many decades American Indian reservations have been demoralized by the seemingly permanent condition of extreme poverty. In some tribal communities, unemployment reaches 80 percent. The disease of alcoholism has taken a severe toll on Indians since its introduction into their culture, and today requires the most serious immediate attention. Health care is of the most critical concern. Infant mortality rates on some of the reservations are at shocking levels-as high as double the national average. The tragedy of early death from illness or suicide has touched all members of these families-oriented communities. These crises require urgent attention, and tribal colleges are working to provide the leadership, programs, and resources to meet the challenges.

(Boyer, 1989, p. xii).

Many of the circumstances Boyer comments upon are reflected in the Aboriginal experience throughout Australia. Arguing that American society can learn a great deal from Indian peoples Boyer further adds:

We believe that a good place to start learning from American Indians is the Tribal College, where we can learn about survival, about hope and determination in the face of extreme adversity, about renewal of community, about reclaiming the individual and the society from dependencies of all sorts, and about creatively connecting education to the larger world. Clearly American society has a great deal to gain by supporting the tribal college movement and learning from the first Americans.

(Boyer, 1989, p. xiv).

The Tribal Colleges are at once a rejection of the Eurocentric education systems and a beacon to the incredible resilience of Indigenous people across the world.

Aotearoa (New Zealand)

Closer to Australian shores, the failure of Eurocentric education systems to deliver meaningful and culturally affirming and academically empowering education experiences and outcomes for Maori led the Waitangi Tribunal in 1986 to assert:

The education system in New Zealand is operating unsuccessfully because too many Maori children are not reaching an acceptable standard of education. For some reason they do not or cannot take full advantage of it. Their language is not adequately protected and scholastic achievements full far short of what they should be. The promises of the Treaty of Waitangi of equality in education as well as in all other human rights are undeniable. Judged by the system's own standards Maori children are not being successfully taught, and for that reason alone, quite from a duty to protect the Maori language, the education system is being operated in breach of the Treaty.

But change is underway in Aotearoa with New Zealand Stats (2020) reporting that data from the 2018 NZ census showed: "...that in both secondary and tertiary studies, younger Māori and Pacific peoples are achieving outcomes closer to the national average than their counterparts in older age groups."

New Zealand Stats added: "In the 2018 Census, 80.6% of Māori and 83.0% of Pacific 15- to 24-year-olds had at least a level 1 qualification or equivalent (such as School Certificate), compared with 85.8% of 15- to 24-year-olds nationally."

While New Zealand Stats, Susan Hollows, senior manager census data delivery, observed: "There has been a focus over recent decades on improving cultural understanding and teaching approaches within New Zealand's education sector, which may have had an effect on the numbers of students achieving formal qualifications" (See New Zealand Stats 2018).

Unquestionably Maori are determined to control their educational destiny; a determination matched only by their tenacious and highly successful effort to save their language from extinction. The development of the innovative and creative language re-

vitalization program Te Kohanga Reo language immersion, that are tied to Maori education objectives, commenced in 1982 and is recognized and celebrated across the world as best practice, especially by Indigenous peoples involved with language protection and revitalization. The destruction of Indigenous languages was, and in certain circumstances remains, a fate common to many Indigenous peoples impacted by invading colonial forces and settler societies.

Some attempts are being made to save and revitalize Aboriginal languages in NSW and this is acknowledged and applauded but most of these efforts are school based and therefore susceptible to government rules and regulations, thereby relegating the voice of Aboriginal people as, at best, incidental or functionally inconsequential.

Even with this perfunctory examination of the international Indigenous education experience, there are clear signs that systemic education failure is manifest at alarming levels in multiple Indigenous contexts. The data also illustrates that success is possible when education systems are designed and controlled by Indigenous peoples. In the Canadian, New Zealand and US context, a rights-based education is reflected in their respective negotiated treaties. No such treaty exists in Australia.

Connecting the eurocentric education and aboriginal incarceration dots

Aboriginal adult and juvenile detention rates are at ever increasing and alarming levels in Australia, the extent of which is evidenced in an article published in the Guardian newspaper in 2019 that reported that 100% of juveniles in youth detention in the Northern Territory (NT) were Aboriginal.

The pain and trauma of incarceration and the ever increasing incidents of death in custody led to the establishment of The Royal Commission into Aboriginal Deaths in Custody (RCIADIC) in 1987. The Royal Commission delivered its final report in 1991 after examining the circumstances of 99 Aboriginal deaths in custody. At Volume 2 - Chapter 16 (1991) headed "Schooling" the RCIADIC reported:

The failure of schooling to provide a meaningful and useful experience for many Aboriginal people interacts with, and is a reflection of, their failure to achieve desired levels of participation in Australian society generally, and to command a level of services in respect of education, health and social justice which is commensurate with the rest of the Australian population. In many of the cases investigated, in hearings conducted into underlying issues, and in numerous submissions, this Commission has heard of the inextricable links between the formal education system, child welfare practices, juvenile justice, health and employment opportunity as factors contributing to the disproportionate representation of Aboriginal people in police and custodial facilities.

(RCIADIC, 1991).

The report of the Royal Commission included 339 recommendations each aimed at reducing Aboriginal incarceration rates, deaths in custody and other associated matters, but some thirty years after the tabling of the Royal Commission report very few of the recommendations have been operationalized by any Australian state or territory and to compound matters, a reported 474 extra number of Aboriginal deaths in custody have occurred since the tabling of the Commission's final report.

Aboriginal deaths in custody are traumatic for the families and loved ones and I was impacted by this when I read a 2020 coroner's report dealing with an Aboriginal death in custody case. Reading such a report is challenging under any circumstance but it is made even more so when the person the report relates to is a relative, in this case, a nephew. My nephew was not the first of our extended family who became yet another statistic in the ongoing crisis of Aboriginal deaths in custody. Therefore, I continue to struggle to understand a world within which the lives of Aboriginal men and women are so little valued by the authorities who seemingly act with callous indifference and impunity to the findings of the 1991 Royal Commission into Aboriginal Deaths in Custody.

My nephew was a special young man, proud of his Gumilaroi identity and of being the father of 4 loving children. He struggled with the education system but was, and will always be, a much-loved member of our family, the grandson of my eldest sister Mary.

Like so many Aboriginal people, the nephew felt alienated from the world into which he was born and was failed by the Eurocentric education system he was compelled to attend. He sought refuge in illicit substances to ease the pain of meaninglessness, alienation and historical trauma. The treatment of Aboriginal people at the hands of authorities continues to torment families and unfortunately lead some of our people into life choices that often end in tragedy. But no matter what the circumstances, the people who are driven to such despair are human and deserve better than to take their last breath alone and in custody.

Meaninglessness, alienation and loss of culture and purpose (MAL) & Aboriginal Education

Meaninglessness, alienation and the loss of culture and purpose emerged as a concept from a project commissioned by an Aboriginal Medical Service (AMS) in NSW. The project was to examine why Aboriginal men were not engaging with AMS clinical services and programs and to recommend possible new approaches.

Focus group consultations with Aboriginal men were conducted during the project and the men reported a sense of what the project team identified as meaninglessness, alienation and a loss of culture and purpose (MAL). The concept of MAL is informed

by and aligns with Viktor Frankl's theory of logotherapy (Frankl, 1938). The men had a strong belief that they were losing their culture, their role as men and their Aboriginal identity.

The men were considered to be suffering from what celebrated psychiatrist, philosopher and author of "Man's Search for Meaning" (1938), Dr. Viktor Frankl, calls an "existential vacuum." Writing about the mental health of some of his patients Frankl shares the reported "feeling of the total and ultimate meaninglessness of their lives." His patients, he argued, suffered a:

... lack of awareness of a meaning worth living for. They are haunted by the experience of their inner emptiness, a void within themselves; they are caught in that situation which I have called the "Existential Vacuum."

(Frankl, 1938, p. 111).

Inspired by Frankl's work I contend that an increasing number of Aboriginal peoples also suffer from what I refer to as "Spiritual Fatigue" (2020), a debilitating consequence of being forced to live and withstand trauma while either constantly struggling for human rights and freedoms or being forced to constantly defend them. There is no room for celebration and meaning in this paradigm - it is simply a choice between struggle or defense.

Aboriginal learners carry this existential vacuum and spiritual fatigue into classrooms and unless school curriculum, teaching methods and assessments policies and practices recognize and accommodate this reality the learning experience of Aboriginal learners, will continue to be one of failure, for both learner and teacher.

Although there is, as yet, no empirical evidence to support it, I am firmly convinced that MAL and spiritual fatigue create an "existential vacuum" for Aboriginal children and is present in the education journey of many Aboriginal school learners, especially those who are culturally grounded, connected to country, kinship systems and the obligations and responsibilities that stem from such relationships. Though untested, it is believed that MAL and spiritual fatigue form an "existential vacuum" which may also be present as a determinant in the alarming rates of Aboriginal youth incarceration and the distressing rates of Aboriginal youth alienation and suicide.

I contend that meaning and purpose were present in traditional Aboriginal knowledge settings and manifested in rites of passage such as initiation ceremonies for both Aboriginal boys and girls.

As Aboriginal people we must take greater control of the education in which our children are enrolled if the debilitating experience of education failure, incarceration rates and youth suicide and other life limitations are to be effectively addressed. A rights-based education pedagogy incorporating the provocations identified by Professor Rigney above, and other matters, must be the basis upon which greater Aboriginal control of education is exercised.

Positive signs of the promise and transformation

Two exceptional Aboriginal education leaders, Fiona Kelly and Tammy Anderson are principals of schools with a high proportion of Aboriginal students and they are developing and applying an Aboriginal informed and aligned pedagogy that, if the system does not interfere, will undoubtedly result in improved outcomes for Aboriginal and other learners enrolled in their schools. These improved learning experiences and outcomes will take time.

Both these exceptional education leaders are tethered in their culture and community and this groundedness has helped them create learning environments where teachers are valued and where positive learning achievements for students are beginning to take hold. Community engagement and involvement is a strong and celebrated feature of the learning environment created and present in each of these schools.

Added to this is a growing list of non-Aboriginal teachers who are also striving to create culturally affirming and responsive learning environments for Aboriginal learners. One example of this is the work of a newly appointed teacher with one of the schools that I work with as a critical friend. The school is small with a majority of Aboriginal student enrolments and is located in a rural and isolated region of NSW. These are the types of schools that first year out or new teachers are usually assigned, as was the case with this teacher at the beginning of 2021.

The teacher is an Australian who had been working as an academic in overseas universities. I initially met the teacher during an orientation program I was invited to attend and participate in. I was intrigued as to why the teacher had decided to move away from university teaching and be involved with teaching Aboriginal kids. After getting to know him I witnessed a profound level of commitment to social justice and equity and given his academic background I advised that he keep a journal of his teaching experience and of his engagement with the community.

The teacher took this advice onboard and is in the process of developing and recording what he refers to as "Emergent Discourses", a process that he uses to more effectively engage the students he shares the learning journey with. The teacher's work is exciting and a synopsis of one of his journal texts is provided to illustrate the nature and potential of his work.

The teacher describes the philosophical underpinnings of his work in the following manner.

Donald Winnicott, in *The Maturation Process and the Facilitating Environment* (1965), postulated a “potential space” between the significant carers and the child, in which the carers “held” the child and thus fostered her development in a safe and constructive context. In this space, the “good enough” carers knew somewhere in themselves that healthy development was affective as well as cognitive, that the child needed to be stimulated but also held and nurtured, and that they themselves needed to be present in that space just enough, and not too much, so as not to stifle the child’s spontaneity and creativity. This “negative capability” is a necessary quality, in carers of children at home as well as in other contexts, such as in school, to foster the capacity to learn on an autonomous basis. This assumption that schooling should foster the autonomy of the learner, even as it provides a safe and stimulating environment to nurture growth, is at the centre of my teaching philosophy, and implies the involvement not only of the teacher in the classroom, but also in other significant social contexts of which the learner is a part: the school outside the classroom, the family, and other community groups.

The social context is central to learning because it is through discourse with others that our actions, emotions, and ideas are socially validated. A child will feel included in a social context in which he can recognize his culture: ways of being, acting, and expressing himself. A person continually redefines her identity in response to social contexts, and so a continued sense of inclusion, caring, and belief in the person’s capabilities is important for the development of a strong validation of the self, including a belief in one’s own capacities. If the aim of mass schooling is to prepare children for a fulfilling life beyond school, then providing a vibrant and inclusive social context at school, in association with the local community, in which children feel held and secure, and in which their cognitive and affective needs are recognized and met, is of the highest importance. As for teacher qualities, along with negative capability, a nuanced sense of children’s affective needs, so that even the restless children can be included wherever possible, needs to be developed. Academic excellence is built upon a professional and caring relationship with the teacher, in which the teacher communicates to the learner that the teacher not only has high expectations of the learner and believes that the learner can meet them, but also that the teacher has her in mind, is thinking about the next steps in the learning process, and is thinking about her educative well-being generally. In this context, a person can continually construct and re-construct meaning from the teaching materials, discussion with classmates, past experience, and inner dialogues from past mentors, as they progress through the schooling experience. Moreover, a child who is developing their autonomy in a secure and validating context that is inclusive and supportive of academic achievement will bring these values to impact on the future of his society (teacher, personal communication).

Of course, the teacher’s work is at an embryonic stage of development but it shows exciting possibilities and promise. The teacher has reached out to parents and community members to better understand the concept of what is essentially a rights - based Aboriginal education pedagogy demonstrating that it is possible to affirm students culturally while engaging in other school-based learning. The ex-Principal of the school where the teacher is based, shared with me after a visit he made to the school and community that the teacher has his students “eating out of his hand.”

This is further evidence of the supportive role that non-Aboriginal people can play in Aboriginal education especially when they not only acknowledge and value the culture and identity of the students but that they also view this as a vital, valued and respected aspect of knowledge creation to enhance Aboriginal student learning experiences and outcomes.

Culturally grounded education warriors

The late 1970s and especially the seminal years of the 1980s provide the foundations and impetus for the emergence of a burgeoning number of Aboriginal thinkers; education warriors who have strong and well-established connection with community, culture and country who build on the work of earlier generations to inform and define their advocacy for educational justice and change. Culturally grounded warriors are strongly steeped in their culture and identity and are challenging and reforming systemic Aboriginal education failure. The individual and collective success of these warriors, and others, will undoubtedly lay the foundations for future educational change and transformation for generations to come.

In early 1980, the National Aboriginal Education Committee (NAEC) developed its 1000 by 1990 strategy (1982). Underpinning the strategy was the belief that having more Aboriginal teachers in classrooms would improve Aboriginal student learning outcomes. There are now, reportedly, more than 1000 Aboriginal teachers in the classrooms in NSW but improved Aboriginal student outcomes, with some marginal exceptions, remain largely aspirational.

Acknowledged as “the first of its kind,” the NSW Aboriginal Education policy was developed and released in 1982. The policy was largely the result of the tireless advocacy and work of the NSW Aboriginal Education Consultative Group (NSWAECG). The policy addressed many of the matters raised in this paper but 40 years after the release of the policy Aboriginal students are still being failed by the Eurocentric education system even though it is acknowledged that the little progress that is being made occurs at torturous and glacial pace for both student and parents.

Final words

Performance data emanating from the Closing the Gap (CTG) national agenda reports illustrate that after more than a decade since the introduction of the CTG, despite the strategy being underpinned through the allocation of a significant level of support funding, the evidence points to a situation where little meaningful progress is being made against identified CTG targets, including education.

Aboriginal people have always viewed education as a means of overcoming poverty, alienation and oppression, but education has never been viewed as a site, nor a process to surrender Aboriginal identity and culture.

The education experiences and outcomes for the majority of Aboriginal learners remain basically devoid of culturally affirming and responsive content and dominant culture Aboriginal education policies and programs, including instruction and assessment methods, with some minor exceptions, remain primarily aligned to pernicious assimilation objectives. These assimilation objectives are destructive when considered individually but their potency grows exponentially when considered collectively, especially when they are infused by racism and notions of deficit, whiteness and white fragility.

Continuing systemic Aboriginal education failure is evidence of an urgent need to develop a model of a rights-based education, one that is based on the principles contained in the UN Declaration on the Rights of Indigenous Peoples and the Coolangatta Statement. The provocations outlined by Rigney align with the voices of Aboriginal parents and communities and must inform and shape the development of this rights-based model of Aboriginal education.

Many years ago I was asked the question; "What do Aboriginal People want from Education?" I responded by saying:

Knowledge and skills to live life in safety and with dignity. To embrace, through language and knowledge systems, the teachings embedded in Country. To heed the lessons derived from timeless song-lines, oral traditions and cultures. To know, appreciate and celebrate the interconnected symmetry of all creation and the teachings that have sustained Aboriginal peoples since the beginning of time.

I remained firmly connected to this view because, as I see things, these values and principles were embedded in traditional Aboriginal knowledge systems and form the basis of a more empowering rights-based curriculum and pedagogy. Such a model will positively engage Aboriginal students affording them opportunities to achieve progressive learning experiences and outcomes while staying culturally grounded and connected to country and community.

The more I ponder the question of culturally affirming and intellectually enriching education for Aboriginal learners, the more I am convinced that the fullness of its promise will only be realized when a new pedagogy of engagement is designed and developed by Aboriginal people and their allies.

Cultural affirmation and survival are fundamental to the education journey of Aboriginal students but this journey should not be interpreted as a total rejection of the knowledge and lessons that resides in the non-Indigenous world. Rather it is an argument that cultural affirmation and survival should be viewed and embraced as foundational and upon which academic achievement should be built.

At its core, Aboriginal education should be viewed both as a means of cultural survival and an expression of a long denied right to exist and celebrate life as culturally distinct peoples.

It would be easy for Aboriginal people to simply surrender to the assimilationist and social reproduction imperatives embedded in Eurocentric education but history and experience clearly shows that even in the face of overwhelming odds, there has been one constant, the survival of Aboriginal peoples as culturally distinct, adaptive and resilient people. Surrender is not an option.

Perhaps the scars of history are too great and the degree of spiritual fatigue is too immense making the struggle for Aboriginal education reform arduous and elusive and possibly the best that can be hoped for is a benign form of assimilation and an accommodation of difference wrapped up in a not too subtle veil of hegemonic conformity.

To withstand hegemonic conformity and the debilitating experience of education failure, crippling juvenile incarceration and devastating youth suicide rates, and other life limitations, we must, as Aboriginal people take greater control of the education in which our children are enrolled. A rights-based education pedagogy incorporating the provocations identified by Professor Rigney above, and other matters, must be the basis upon which greater Aboriginal control of education is exercised.

Introduction

The topic of Indigenous education is critically important in the 21st century. Alaska has a large Indigenous population and the Alaska Native regional corporations are the state's number one employer. The 2020 US Census data shows that the Alaska Native/American Indian population makes up 21.9% of the overall population of Alaska. This is the highest Indigenous demographic in the entire United States.¹ The Alaska Native population is also a very young population, with 28,620 Pre-K-12 AN/AI enrollment in 2020–21, which is 22% of the entire PreK-12 demographic; the highest in the nation.² The University of Alaska system, which includes three separately accredited universities (University of Alaska Anchorage, University of Alaska Fairbanks, and University of Alaska Southeast), Alaska Native students make up the highest “minority” population in their undergraduate programs, averaging 10–17% of the overall student body.

This article provides a brief overview of the colonial history of Alaska, with a specific focus on Western education, and recent initiatives that illustrate the amount of resources that the Alaska Native corporations and partner non-profits, as well as other tribal entities invest into educating our young population.³

Overview of the geography and diversity of Alaska's Indigenous peoples

Alaska is a subcontinent of North America and encompasses over 570,00 square miles (1,717,856 km), has over 33,000 miles (53,108.352 km) of coastline and is in the Arctic and sub-Arctic regions of our planet. Alaska has six major geographic zones (North Slope, Interior, Aleutian Islands, Southwest, Southeast, and Southcentral). Each of these broad geographic zones include a wide array of flora and fauna and unique ecosystems, and geographic wonders. With over 17 mountain ranges, more than 3 million lakes, and major rivers such as the Yukon, Kuskokwim, Kobuk, Tanana, Susitna, and Copper Rivers—in addition to hundreds more, the diverse landscape of Alaska is matched only by the diversity of the Indigenous peoples who have inhabited it for over 20,000 years.

¹The total American Indian/Alaska Native (AI/AN) alone or in combination population is 160,287. The Census allows citizens to self identify as AI/AN alone, or AI/AN in combination with one or more races. (National Congress of American Indians Policy Research Center, Research Policy Update: A First Look at the 2020 Census American Indian/Alaska Native Redistricting Data, August 13, 2021).

²State of Alaska Department of Education & Early Development Statistics & Reports (<https://education.alaska.gov/data-center>).

³The Alaska Native Corporations are mandated by Congress to provide economic benefit to their shareholders. The corporations have succeeded this arena, however it is important to note that ANSCA did not mandate the funding of post-secondary education or cultural preservation, but the corporations have invested heavily in education and cultural programs.

The Indigenous peoples of Alaska live in all parts of Alaska and developed unique lifeways that reflect the environment they live in. There are over 20 different Alaska Native languages, most of which are still spoken, although they are considered endangered due to colonial practices, including boarding schools.

Alaska Native Language Map. <https://www.uaf.edu/anla/collections/map/anlmap.png>.

Colonial periods

The name of Alaska is derived from the Unangam Tunuu (Aleut) word *Alax̂sxâx̂*. The Aleutian Islands were the first part of Alaska that experienced colonial invasion beginning in the mid-18th century from the Russian Imperial Government. The global commodity during this period of history was fur, and Alaska had abundant fur animals, including the sea otter. The Russian Fur hunting companies arrived in droves once they discovered sea otters, and they enslaved the Unangax̂ (Aleut) and Suqpiq (Alutiiq) peoples so they could obtain fur. Russia claimed this region in 1754 and expanded their empire into southeastern Alaska and parts of the interior. Other European explorers (Cook, La Perouse, Arteaga and Bodega y Quadra, etc.) began to map out Alaskan coastal areas, claim them for their respective countries, and re-name sites. The United States began to grow by leaps and bounds in the 19th century and Russia was bankrupt by the end of the Crimean War, and the two nations negotiated the Treaty of Cession.⁴ In 1867 the Russian Imperial government ceded the right to trade in the Alaskan territories to the United States and the American colonial period began.

The American colonial period was marked by continued resource exploitation (Fur, gold, coal, salmon, timber, whale oil, etc.) and the Indigenous peoples were subject to new forms of colonization, which included a strong Christian Missionary presence (Williams, 2009), establishment of boarding schools, which forcibly removed children from their homes and families in order to facilitate their “americanization” and assimilation into the United States. Additionally, terrible epidemic diseases were introduced, beginning in the Russian era and continuing to the mid-20th century (smallpox, influenza, STD’s, tuberculosis, etc.) which had

⁴Major expansion of the continental United States occurred in the 19th century with the following purchases: Louisiana Purchase in 1803, Florida Treaty in 1819, Oregon Treaty in 1846, Texas Annexation in 1845, Treaty of Guadalupe/Hidalgo in 1848.

resulted in devastating loss of life and effects on the primarily hunting and fishing based economies. The population of Alaska Native people by 1950 was a little over 33,000 (alaskool.org) and most lived in over 200 villages across the entire region.

Traditional education

Education and knowledge have historically been highly valued by the indigenous peoples of Alaska, and the education of children and youth was integrated into life through oral storytelling, cultural values and behaviors, and daily practices. For example, in the Yup'ik tradition, the goal of this education was *Yuyyaraq*, the way of the human being, as described by [Napoleon \(1996\)](#). Education determined how individuals should interact with each other, their environment, the spirit world, and outlined protocols for all situations that a person would experience in their lives. Technical skills were taught in an experiential manner through apprenticeships in which a young person would observe and emulate an expert. Some skills taught were gender specific to create a functioning household and community ([Drabek, 2012](#)).

Westernized education 1867–1971

Non-Indigenous education was first introduced during the Russian colonial period and the first schools were established by the Russian Orthodoxy in the early 1800s. These schools were primarily in the coastal areas where the Russian American Company had control. The Alaska Native people who were enslaved by the Russian Fur hunters during the most brutal period (1754–1819) converted to Russian Orthodoxy and learned to read and speak Russian. The Russian Orthodox Priests attempted to protect the Indigenous people from the horrible treatment of the Russian Fur Companies. The kindness perhaps made conversion a protection against the more evil actions of the companies. After 1819, the American colonies came under the control of the Russian Navy and a more humane and structured approach was adopted. Slavery disappeared along with the more brutal aspects of conquest. Education was very important and there are examples of Indigenous students furthering their education in Russia. Specialized training such as navigation, map making were viewed as critical to making Alaska a viable and sustainable Russian colony.

In 1867 the Russians sold their outposts and the territory they claimed they owned to the United States under the Treaty of Cession. The Americans had a very different approach to colonization than the Russians. The government allied itself with various Christian denominations to convert all Alaska Natives to Christianity and to assimilate them. Education was a colonial tool and this led to the establishment of boarding schools for Indigenous youth all over the US and Canada, and Australia.

The western schools attempted to abolish traditional knowledge systems, including language(s). In the western school environment, children were forbidden to speak their Native languages and were punished for expressing any elements of their culture. Children were instructed about the necessity to become like white people as the essential element of their success. In addition to formalization of education, in some parts of Alaska, separate schools were created to educate White and Native children, predominantly in the Southeast. "Through a combination of laws and informal practice, segregated schools even within small communities became the norm. By 1929–30, segregated schools existed in at least 19 communities—white schools and native schools in the same tiny villages. In most of the communities, the native school stopped at the eighth grade while the white school went through grade 12," ([Cotton, 1984](#)).

By the 1960s 50% of the Alaska Native population had no more than a 6th grade education. 21% completed 7th and/or 8th grades, 14% went into 9–12th grade, but only 8% of that group graduated with a high school diploma. 2% attended a college, but less than 1% completed four or more years of college ([Arnold et al., 1968:17](#)). There were no high schools in most of the 200 villages in Alaska. Western education came in the form of Bureau of Indian Affairs (BIA) schools, state run boarding schools, which removed children from their rural villages to larger urban areas (Kodiak, Nome, Anchorage, Fairbanks) from 6th to 12th grade. The state also created regional boarding schools in Nome and Kodiak. These were disastrous and destructive to the young Indigenous students who were forced to leave their homes. This changed due to student activism and a major lawsuit. Often called the "Molly Hootch" case, *Tobeluk vs. Lind* became a landmark in education litigation and changed middle and high school education throughout the entire state for Indigenous students. 27 high school students in rural Alaska sued the State Commissioner of Education because they were forced to leave their home communities and attend boarding schools far from their homes. In 1976, the case of *Tobeluk vs. Lind* was settled by providing the establishment of high schools in 126 villages. Anna Tobeluk and the other 26 students' lawsuit revolutionized the delivery of secondary education in rural Alaska.

Modern American period: 1959–present

Alaska became the 49th state in the union in 1958/59 primarily due to the discovery of the massive oil fields in the North slope. The newly formed State of Alaska and the US Federal government began doing land selections and did not include Alaska Native people. The lands of the Indigenous peoples were being claimed by the State of Alaska and Federal Government. Alaska Native people in over 200 villages throughout the entire region were faced with losing their ancestral lands—access to their hunting and fishing and gathering areas. Additionally, the newly formed State of Alaska and Federal governments initiated major projects that would have detrimental effects on numerous Alaska Native communities. These included the Rampart Dam project, which proposed to create

a recreation lake larger than Lake Erie by damming the Yukon river and flooding the Rampart flats—which is a high yield subsistence area and home to several Dene/Athabaskan villages. The U.S. Defense Department created an Atomic Energy Commission that was planning on detonating atomic bombs in the coastal Arctic region of Alaska near several Inupiaq villages. Both of these projects would have destroyed hunting and fishing areas, as well as villages. No Alaska Native people were consulted and this led to what is now called the Land Claims movement, or Native Solidarity Movement (Williams, 2009:202–216). This led to a period of intense political activism, and the establishment of the *Tundra Times* newspaper in 1962. The *Tundra Times* became a vital conduit of information that was shared throughout all the various cultural groups and villages in Alaska and brought many groups together to fight and organize in order to protect their lands.

Formation of Native Association

The formation of Native Associations in the 1960s was a way in which each broad region could begin to patent their lands, and initiate their own land claims. This was a highly effective vehicle and each Association was roughly formed around pre-existing culture areas. These early associations began to patent land so they could protect their land base. In 1966 they formed an umbrella organization called the Alaska Federation of Natives. This became the political and lobbying arm and led to a land freeze. The State could not select any lands until there was a land settlement.

1971 Alaska Native Claims Settlement Act

On December 17th, 1971 President Richard Nixon signed the Alaska Native Claims Settlement Act (P.L.92-203). This was the largest land settlement in the history of the US Congress and represented sweeping new changes to previous treaties and agreements with American Indians. ANCSA had both a land settlement and an agreed upon sum of lands lost—so it included a land settlement of 44 million acres and over \$900 million land settlement for lands lost. The other unique feature of ANCSA was the establishment of 12 regional corporations and almost 200 village corporations. It was a social engineering approach designed to create a capitalist economy and a more western-based economic structure.

The Native associations formed in the 1960s were empowered to enroll shareholders, locate office space, elect boards of directors, and create a sustainable economic base. ANCSA, Section 7(a) identified these associations. “For purposes of this Act, the State of Alaska shall be divided by the Secretary within 1 year after the date of enactment at this Act into twelve geographic regions, with each region composed as far as practicable of Natives having a common heritage and sharing common interests....”

The Alaska Native Corporations and their respective regions. Courtesy of ANCSA Regional Association.

Within a 2 year period, the various corporations created enrollment mechanisms for their constituencies, and became incorporated. Each of the main regional corporations, and the village corporations had unique pre-existing histories and cultural practices. Also, each of the geographic areas had various resources that could be developed (timber in the rainforests of Southeast Alaska; the oil and gas in the North Slope and Cook Inlet area; mining such as zinc and copper, fisheries, etc.) in order to make profits and pay dividends to their shareholders. Each region also had shareholder enrollments that varied from a little over 1000 to almost 17,000; additionally the villages in each region varied from a handful to over 56.

Native sovereignty and Western education

Many of the architects of ANSCA were among the few Alaska Native people who had the opportunity to achieve Western higher education degrees, and/or were in military service in World War II and the Korean conflict (The military provided an avenue for providing knowledge on western practices, as did higher education). Early leaders such as Eben Hopson of the Arctic Slope region focused on the importance of education. He had an activist approach in reclaiming Inupiat control of the Arctic Slope area, and was one of the founders of the Arctic Slope Native Association, which later became the Arctic Slope Regional Corporation after the 1971 Alaska Native Claims Settlement Act. He identified traditional education vs. what he termed “coercive assimilationist educational era” in his Mayor’s address on December 19, 1975 (<http://ebenhopson.com/eben-hopson-on-inupiat-education/>). He and other leaders in the early 1970s focused on gaining more power and control in the arena of education, which was squarely in the hands of state run boarding schools.

The newly formed Alaska corporations, and the broader Native community felt that education and/or training beyond the secondary level was key to building a foundation for a solid financial livelihood, community stability and capacity for positive societal impact. Put simply, they recognized Native sovereignty in this time-period required Western education. The leadership also recognized that the western educational system could be a tool that could promote a more robust Indigenous community.

By the mid to late 1980s, the number of Alaska Native students graduating from high school began to increase and put post-secondary options in their sights. At the same time, with the creation and growing success of the Alaska Native corporations, a new suite of professional positions began to open. Suddenly, highly skilled professional positions were in demand—from accountants to attorneys, human relations specialists to C-suite executives, along with a wide variety of technical positions in industries as varied as forestry and oil. Locked out of professional fields and trades for so long, Alaska Native corporate board leaders believed first and foremost that those positions should be held by Alaska Native people—and if they did not have the training to hold those roles that it would pay for them to receive education.

Starting as early as 1977, each of the 12 regional corporations established entities to support activities to preserve its Alaska Native cultural heritage and/or provide higher education support for Alaska Native students. The corporations each provided significant financial resources and operational support to these newly formed nonprofit entities, in the form of endowments or annual cash donations.

Known colloquially as the “Alaska Native education foundations”, the 12 entities were organized differently, at separate times, and remain highly fluid. Some are private foundations, while others are nonprofit organizations, still others are organized as programs that are administered by the corporate offices. While the structures are different, remarkably, the overall purposes and missions of the organizations are similar. Most entities adopted missions to specifically provide scholarship funding and other educational support for students to pursue post-secondary credentials and degrees, and to promote and preserve the Alaska Native cultural heritage of their respective region.

Establishment of Foundations⁵

Arctic Education Foundation (1977)

Sealaska Heritage Institute (1980)

The CIRI Foundation (1982)

The Ahtna Heritage Foundation (1988) -Scholarship program now operated by corporation

⁵When data was unavailable from the entity, authors relied on listings available on public charities at [propublica.org/nonprofits/](https://projects.propublica.org/nonprofits/). In some cases, dates may reflect the state of IRS determination, and not the entity’s creation by founders.

Aleut Foundation (1996)
 The Koniag Education Foundation (1993)
 Robert Aqqaq Luk Newlin Sr. Memorial Trust (2014)
 The Beringia Settlement Trust (2018)—(formerly the Bering Straits Foundation—1991)—scholarship program now operated by Bering Straits Native Corporation
 Bristol Bay Native Corporation Education Foundation (1992)
 Calista Education and Culture, Inc. (2014, formerly Calista Heritage Foundation, 1980)
 The Chugach Heritage Foundation (1985)
 Doyon Foundation (1989)

Since inception, each organization has taken on specific programs and activities in response to community needs. The first private foundation was established by Arctic Slope Regional Corporation in 1977. The Arctic Education Foundation was created to prepare Iñupiaq students to enter the professional workforce in any job, particularly those required in the North Slope region ([Arctic Education Foundation, n.d.](#)). Sealaska Heritage Institute was created specifically to focus on perpetuating Tlingit, Haida and Tsimshian cultures of Southeast Alaska, with an additional focus on scholarships and Western education ([Sealaska Heritage Institute, n.d.](#)). The CIRI Foundation, based in Alaska's largest city of Anchorage, adopted a two-fold mission to promote individual self-development and economic self-sufficiency through education and to maintain pride in Alaska Native culture ([The CIRI Foundation, n.d.](#)).

As the organizations have matured, they have expanded to offer a variety of programs. The foundations have an impressive array of language and cultural materials, sponsor major dance festivals, and other types of educational initiatives, including publications. For example, the Chugach Heritage Foundation runs a very successful culture camp for youth and elders in Prince Williams Sound, hosts an annual Russian New Year celebration and maintains a robust scholarship program for students seeking college and university degrees, as well as vocational certificates. Calista Heritage Foundation was established in 1980 to fund scholarships for Calista Corporation shareholders and descendants. In 2014, it merged with the Calista Elders Council to create Calista Education and Culture, a nonprofit organization ([Calista Education and Culture, Inc., n.d.](#)). The organization is now active in cultural heritage work, including impressive language and cultural documentation of Yup'ik, Cup'ik and Dene/Athabascan ways of life, and continues its scholarship work to benefit students seeking college and vocational education. Similarly, Doyon Foundation has worked extensively in preservation and revitalization of the Dene/Athabascan languages and Iñupiaq, in addition to scholarships for students ([Doyon Foundation, n.d.](#)).

Who is served—eligibility

Most of the entities created by the Alaska Native Corporations initially limited their eligibility to serve a specific group of people—Alaska Native shareholders of each of the corporations. In order to become a shareholder of an Alaska Native Corporation, individuals had to meet a requirement of one-fourth blood quantum of Alaska Indian, Eskimo or Aleut blood, and were born on or before 11:59 p.m. on December 18, 1971. As a result, original shareholders are now 50 years old. The US Congress passed major amendments to ANSCA, which allowed corporations to amend their articles of incorporation to expand shareholder eligibility and allow for the enrollment of shareholder descendants and the gifting of shares to subsequent generations. It was up to each corporation to decide how and when to enroll descendants and offer services to this large, and ever growing, group. Similarly, the education entities also have been tasked with determining eligibility. Some entities have opted to serve descendants, and some still require students to become shareholders before they become eligible. Most entities require some tangible tie to an original shareholder, such as proving a student is a direct lineal descendant.

ANSCA Education Consortium

In the year 2000, the education entities began to meet regularly and formed a loose-knit association to be able to share information and ideas across the regions. The ANSCA Education Consortium (AEC) exists with a purpose of Alaska Native Education and Cultural advocacy and operates under the values of sharing for success, unity and the potential of our Alaska Native people. Led by annually elected co-chairs, the group operates under the mission that every Alaska Native person wishing to pursue postsecondary education should have the means to obtain it. Originally, its membership included the 12 Education nonprofit, foundation and programs created by 12 regional corporations. The Consortium now also includes scholarship entities created by village corporations and those organizations/entities that are invested in Alaska Native student success. In addition to the education and career-development of Alaska Natives, members of the ANSCA Education Consortium also focus on language revitalization, culture and tradition, early education, teacher training, and preservation and perpetuation of Alaska Native art forms.

Impact

To date, a comprehensive evaluation of the overall historical impact of the AEC organizations has not been completed, nor has one that more narrowly focuses on their significant contributions to supporting scholarships of Alaska Native students. This is an under-researched area. However, a number of professional reports offer a glimpse of their impact, and a larger scale report is planned.

According to the ANCSA Regional Association's website "Between 1977 and 1993, each of the twelve regional corporations chose to provide the initial financial investment to create separate non-profit foundations to support the advancement of the educational endeavors of their shareholders and descendants. To date, the twelve education foundations have awarded more than 54,000 individual scholarships to Alaska Native shareholders and descendants, totaling more than \$100 million for Alaska Native people to pursue various educational endeavors." ([ANCSA Regional Association, n.d.](#)) In all likelihood, the number of scholarships awarded and individual students impacted is under-reported as the independent nature, long lifespan, and capacity of the entities has impacted the ability to collect data from each. The private foundations report significant contributions on their tax filings with the IRS each year, for both scholarships, grants and related operating costs. In 2019, AEC organizations designated as private foundations by the IRS reported significant charitable disbursements totaling more than \$15.3 M ([Propublica, 2021](#)).

On websites and in correspondence, the AEC organizations offer a glimpse into their investments over time. The Arctic Education Foundation reports it has awarded \$39.2 M in scholarships since 1977. The CIRI Foundation reports that since 1982 it has contributed more than \$39.6 million for post-secondary scholarships (totaling 17,859 awards), and an additional \$3.7 million for its cultural heritage and education program ([Morris, 2021](#)). Sealaska Heritage Institute and Sealaska Corporation indicate that they have awarded approximately 11,000 scholarships totaling \$20 million in their 40-year history ([Sealaska Heritage Institute n.d.](#)). Since 1991, Bering Straits Native Corporation says it provided more than \$4 million in funding to support the postsecondary educational goals of BSNC shareholders and descendants ([Bering Straits Native Corporation, 2021](#)). Calista Education and Culture similarly reports it paid 2706 scholarships worth \$5.85 million to its shareholders and descendants ([Bavilla, 2021](#)). The Chugach Heritage Foundation indicates it has paid \$10.6 million to 2200 scholarship recipients in its history. Koniag Education Foundation reports that it has awarded over \$7 million in scholarships to Alutiiq students via 3000 individual scholarship awards ([Kreger, 2021](#)).

Case study: Bristol Bay Native Corporation education foundation

After more than a decade of providing scholarships to students via its corporate philanthropy, the Bristol Bay Native Corporation Education Foundation (BBNCEF) was created by Bristol Bay Native Corporation (BBNC) in 1992 as a private foundation with the mission to support BBNC shareholders with higher education and vocational scholarships ([McDowell Group, 2019](#)). In 2019, BBNCEF launched a comprehensive evaluation of its scholarship programs that serve as an illustrative snapshot of the overall impact of AEC investments. It was a significant undertaking that included unearthing board meeting minutes, notes, scholarship files starting in the early 1980s, and collating them for the first time in an electronic database. The evaluation was conducted by the McDowell Group (now called McKinley Research), a respected Juneau, Alaska-based research group. The evaluation found that the Bristol Bay Native Corporation began awarding scholarships as early as 1984, 8 years prior to formally creating its private foundation (McDowell Group, August 2019). From 1984 to 2019, BBNCEF had awarded 3787 scholarships worth nearly \$6.4 million to its shareholders for both higher education and short-term vocational training.

The same evaluation examined outcomes for 942 individual recipients who were tracked in the National Student Clearinghouse Database (77.8% of the total number of identified recipients). The report showed that scholarship recipients enrolled on average for 12 semesters and would often attend more than one institution in multiple states. The research indicated that 39.3% of BBNCEF scholarship recipients had graduated with a degree and were not currently enrolled, 12.6% were currently enrolled, 9.4 had previously graduated and had re-enrolled, and 38.6% had no degree and were not currently enrolled.

By adding both graduate categories together, the study showed that 48.7% of Alaska Native students who had received a scholarship had achieved a post-secondary credential. When put against the backdrop of overall postsecondary attainment for Alaska Native students, it represents the significance of both the funding and importance of the connectivity to their regional corporation, community and cultural identity. For BBNCEF, it is also important to note that the vast majority of Alaska Native students who apply for scholarship funding were awarded during this time period— in some years, it's 100%. Students are not cherry picked for outcomes but represent all eligible students seeking to complete secondary education.

In addition, according to the NSC data, many recipients were awarded more than one degree or credential. Forty three percent of degrees awarded were Bachelors degrees, 25% were Associate, 13% Advanced.

Of the major fields—the most common were business, management, marketing, and related support services (16%), health professions and related programs (11%), liberal arts and sciences, general studies and humanities (11%), and education (10%). Most student recipients attended post-secondary school in Alaska, followed by Washington State and Colorado. Scholarship recipients attended the University of Alaska Anchorage (54%) and University of Alaska Fairbanks (48%), followed by University of Alaska Southeast (9%) and Fort Lewis College (7%).

As a result of the evaluation, BBNCEF has altered some of its offerings to become more student-centric to address needs identified by the data as well as key respondents in a series of qualitative interviews with regional leaders, elders and students. BBNCEF recently increased its award levels for vocational scholarships interested in pursuing career focused vocational training such as welding, mechanics, commercial driving, and aviation. BBNCEF has also opened an emergency aid scholarship as a way to encourage students to stay enrolled. Funds are available to pay for emergencies such as travel to home communities, vehicle fixes, child care, or medical procedures.

Increasingly, BBNCEF is understanding that a strong sense of cultural identity, established early, contributes to academic success. In addition, it recognizes that cultural wisdom and knowledge is a complete and intact knowledge system that is as significant and worthy as Western knowledge systems. Therefore, BBNCEF has opened a cultural heritage portfolio to offer grants to communities interested in teaching native languages, dance, crafts, tools and a variety of other critical skills. Most grants fund activities that support activities that develop self identity and awareness for students Pre-K to grades 12, in a variety of settings from traditional village-based cultural camps to web-based classes for young adults.

A coalition of funders

The focus on providing educational support for higher education for Alaska Native students has been shared by organizations across the State of Alaska. Many village corporations also created scholarship programs to serve Alaska Native village corporation shareholder students and descendants. Other entities, such as regional economic development corporations, regional nonprofit associations, and other businesses, also offer scholarship support to Alaska Native students from their respective regions. This article does not explore the significant impacts of those partner funding entities, particularly village corporations, and would be a rich area for further data collection and research.

Challenges and opportunities—looking ahead

While funding exists for Alaska Native students to achieve a post-secondary degree or certification, significant challenges exist. A large number of Alaska Native students choose to attend one of the three University of Alaska Universities (University of Alaska Anchorage; University of Alaska Fairbanks; University of Alaska Southeast), and affiliated community campuses. Additionally there is one tribal college, Ilisagvik in Utqiagvik, Alaska Pacific University (Anchorage), Outer Coast College (Sitka), and Alaska Christian College (Kenai). Each of the universities have established various Alaska Native student support centers, as well as academic degree programs in Alaska Native and Indigenous studies. There are student centered programs that provide advisement, guidance, and programming to ensure the students feel a sense of belonging. As previously mentioned, the non-profit organizations provide tuition support for language and arts courses, as well as involvement in establishing new curricular programs.

Within the University of Alaska system academic and student supports exist, but they have been chronically underfunded by the university and have not kept pace with the growing Alaska Native student population. The University has historically also not supported the retention and development of Alaska Native faculty or staff. As a result, Alaska Native faculty make up 3% of the overall faculty, yet Alaska Native people are 20% of the state's overall population. In recent years, the numbers of Alaska Native faculty has actually decreased.

<i>Alaska Native faculty demographics</i>			
	2019	2020	2021
UAA	21	11	10
UAF	18	15	12
UAS	4	4	3

<i>Alaska Native undergraduate graduation rates</i>	
UAA	10% Alaska Native graduation rate within a 6–10 year window ⁶
UAF	9.7% Alaska Native graduation rate within a 6–10 year window ⁷

These facts are disturbing and require attention of the Alaska Native community to address. The Alaska Native Studies Council, an active group of Alaska Native Faculty and Faculty that teach in Alaska Native studies met with community members and the University administration. This led to what is called the Alaska Native Success Initiative or ANSI. The UA board of Regents endorsed recommendations of the ANSI, which included rigorous recruitment and retention of Alaska Native Faculty. This was passed in June of 2021. It is too soon to say if this will yield any changes.

Conclusion

Alaska Native people are strong, resilient and practical people who have always valued, and continue to value, the importance of education and knowledge. These communities and leaders created a unique social infrastructure in Alaska Native corporations in order to protect their Native way of life and create a basis for a capitalistic economy. By utilizing the profits of the corporations, leaders subsequently formed nonprofit organizations to further focus on missions of providing financial support for students for attending Western education institutions and protecting cultural knowledge. Despite suffering significant physical and emotional abuse and racism in Western education environments historically and in more recent times, Alaska Native leaders continue to see value in learning and providing opportunities for young people to be exposed to worldly knowledge and how skills can create better communities.

While the entities continue to grow and evolve, the next stage of work is to truly document and understand the significant impact of funneling millions of dollars of investment into Alaska's greatest resource—its people. The impact and support of the Alaska Native regional corporations is undeniable, although significantly under researched and largely unrecognized outside the State of Alaska. The existence of a coalition of entities focused on the tasks of providing higher education scholarship support for indigenous students and supporting cultural heritage efforts is likely unique. It may be impossible to document historical investments in education, but systems could be put into place now to gather data on an ongoing basis and utilize that information in order to become greater advocates for Alaska Native people at the local, state, and federal levels.

The Alaska Native corporations and AEC may seek to leverage their respective political and economic clout to improve the K-12 educational system in Alaska, and also for the University of Alaska system. The amount of dollars that the Corporations and their non-profits have invested in education is significant, and yielded thousands of graduates. How can the investments that the Corporations and foundations have leverage to insure more success? Perhaps in a shared 5–10 year plan to increase high school and college graduation rates. High School graduation rates for Alaska Native/Indigenous students remain lower than the non-Indigenous students. If they were able to exert pressure on the State Department of Education, allow tribal compacting of schools, and use their clout to pressure the University system with an approach that incorporates benchmarks and goals, and repercussions if the institutions do not reach these goals. Each of the individual foundations have distinct profiles. This is a great strength, but is also challenging when identifying a metric for evaluation on the effectiveness of their educational programs, and/or support for education via scholarships or having a shared approach in dealing with the State Educational System. However, it must be pointed out that one of the strengths of the 12 Alaska Native corporations and their non-profits is distinct approaches and unique profiles and connection to their specific land base and language and cultural practices.

What will Alaska Native education preK-12 and post secondary look like in the next 50 years? 2021 was the 50th anniversary of the Alaska Native Claims Settlement Act. 2071 will be the 100th anniversary—what will the corporations and their associated non-profits look like? What will a decolonized education look like in Alaska? How do we get to a decolonized educational system?

The need to improve educational opportunities at K-12 and higher education level is a topic of broad discussions within the Alaska Native community. We highlight possible pathways forward:

- (1) Educational institutions in Alaska would benefit from incorporating Alaska Native worldviews, cultures, histories and languages broadly into curriculum content, not limited to posters or special programs. The results would be a more effective, rich and place-based educational system for everybody, not just Indigenous students. The Alaska State Board of Education needs to officially adopt the Alaska Standards for Culturally Responsive schools developed by the University of Alaska Fairbanks in concert with Alaska Native educational leaders and statewide groups such as the Alaska Federation of Natives. These are comprehensive and serve as a blueprint for making successful changes (<https://uaf.edu/ankn/publications/guides/alaska-standards-for-cult/>).
- (2) Higher education institutions should provide free or reduced tuition for Indigenous/Alaska Native/Native American Students. If Alaska Native students could attend universities with free or reduced tuition, it would allow the current funds that the Alaska Native Foundations and non-profits spend on higher education be re-directed on establishing think-tanks and publishing curriculum that incorporate Alaska Native worldview, languages, cultures. The funds could also be directed toward the Pre-K-12 institutions, which are in great need of being infused with Indigenous Alaska Native history, language, culture, and science. Content standards need to be further developed and implemented.
- (3) Tribal Compacting: The Alaska Federation of Natives is advocating for tribal compacting of education. If this moves forward it is a step in the right direction of supporting an Alaska Native-centric educational system in the PreK-12 and higher education by allowing tribes and regional associations greater input into their local school districts. Joel Isaak (Dena'ina) is the Project Coordinator for the State of Alaska's Tribal Compacting program, which is in development and ready to be launched (<https://education.alaska.gov/compacting>). The State of Alaska awarded the Alaska Federation of Natives a \$1 million dollar grant to develop and design how tribal compacting will be instituted.⁸ Under the award, the Alaska Federation of Natives plans to:
 - Identify relevant federal and state laws and regulations;
 - Compile relevant material related to educating Alaska Native students;
 - Engage with Alaska Native leaders and subject matter experts on educational compacting options;
 - Design of a comprehensive path forward;
 - Design seminars for educators and administrators on the why and what of compacting;

⁸The award period ended in July 2022 and was not available by the time this article was complete.

- Participate in discussions with the State of Alaska and various committees of the Alaska State Legislature to respond to questions on the final pathway report.
- (4) The State of Alaska should establish a College of Alaska Native Studies, which could create more opportunities for Alaska Native students. Similar to a tribal college, but with a specific focus on the current needs of Alaska Native communities, such as creating more preK-12 teachers, and more teachers of Alaska Native languages, and include Native Nation building as well.

Alaska Native people and communities are resilient. Through concerted efforts in the area of education we have collectively moved in a positive direction. We still have a ways to go and are confident that we will see more local and tribal control of education in the 2020s via the Tribal compacting initiative. There is optimism in the leadership of the younger Alaska Native community, who are agile thinkers and highly strategic. The cadre of Alaska Native university faculty, staff and students are a resource and voice that must be listened to. The Alaska Native Claims Settlement Act has had a positive impact on education and their continued involvement and financial support is necessary as we move forward.

Weaving Together Mind, Body and Spirit: Envisioning Pathways to Trauma-informed Classrooms from Indigenous Perspectives.

Sandra Styres, Ryan Neeppin and Julie Blair.

Opening the circle with our “fallen feathers”¹

Who will sing for us? Who will dance for us?

Who will remind us of our relationship to the earth?

Who will Tell our Stories?²

The subject of trauma-informed classrooms from Indigenous³ perspectives in Canada, which is the focus of this chapter, began with community. Linda Tuhiwai Smith (2012) defines community as a multi-faceted construct that encompasses the “physical, political, social psychological, historical, linguistic, economic, cultural, and spiritual spaces” (p. 128) of community. An Elder from the urban Indigenous community in Tkaronto⁴ approached two of the authors with concerns about his children who are enrolled in classrooms within one of Tkaronto’s largest school boards. His concerns centered around several key issues: (a) literacy achievement rates for Indigenous learners in K-12⁵ classrooms; (b) affordable access to literacy tutoring having implications across diverse subject areas; and (c) low high school graduation rates for Indigenous learners. These conversations resulted in a literacy pilot study⁶ that collected baseline information at Kapapamahchakwew,⁷ an Indigenous-centric school in Tkaronto.

¹Tanya Talaga’s Seven Fallen Feathers.

²King, T., 2003, The Truth About Stories, p. 151.

³In the context of this chapter Indigenous refers to First Nations, Métis and Inuit peoples across Canada. According to Statistics Canada (2021) there are more than 630 First Nation communities in Canada, which represent more than 50 Nations and 50 Indigenous languages. More than half of all Indigenous peoples across Canada live in urban city centers with Ontario having the highest Indigenous population of any other province in Canada. Ontario is home to 23% of all Indigenous peoples in Canada. In Ontario there are 133 First Nations communities representing 7 overarching cultural and linguistic groups. Urban centers in Ontario with considerably high Indigenous populations are: Thunder Bay, Sudbury, Sault Ste. Marie, Timmins, Ottawa, and Toronto. <https://www.rcaanc-cimac.gc.ca/eng/1100100013791/1535470872302>

<https://www.sac-isc.gc.ca/eng/1603371542837/1603371807037>

⁴Tkaronto is the Mohawk word for Toronto. It means “where there are trees in the water.” (John Steckley, cited in Court, P. (2004). How Toronto Got Its Names. Sightlines XLIV(7). United States Institute for Theater Technology, Inc. © 2004, vol. XLIV, Number 7. Retrieved from <https://web.archive.org/web/20080720102358/http://www.usitt.org/sightlines/v44/n07/stories/Toronto.html>). Tkaronto is the capital city of Ontario, Canada. The extensive territories that encompass Tkaronto and the vast lands surrounding it have a long and tangled (hi)story that carries the storied foot prints of the Wendat, Haudenosaunee and Anishinaabek nations. Tkaronto has a treaty with the Mississaugas of the Credit River First Nation, and is part of the Dish With One Spoon Treaty which is a First Nation to First Nation agreement to share the hunting grounds of this territory in peaceful co-existence. The treaty was made between the Haudenosaunee League of the original Five Nations (Mohawk, Onondaga, Oneida, Cayuga, Seneca) their allies and a confederacy of Anishinaabek and allied nations after decades of inter-tribal strife.

⁵In Canada, elementary public schools have classrooms that begin in kindergarten (ages 4–5) and continue through to grade 12 (ages 17–18).

⁶The overarching aim of the pilot study was to provide baseline information in grades 1–3 at Kapapamahchakwew - Wandering Spirit school to support the development of a tutoring literacy program for Indigenous learners that would have implications across a wide range of subject areas. Utilizing OISE’s Master of Teaching student teachers as tutors and mentors, our aim was to increase Indigenous student success, achievement and well-being in K-12 classrooms.

⁷Kapapamahchakwew - Wandering Spirit School is an Indigenous-centric school in the Toronto District School Board. It was established in 1977 by Pauline Shirt and Vern Harper who were looking for a culturally safe and Indigenous identity focused school for their own child. In 1983, the school was recognized by the Toronto District Board as a Cultural Survival/Native Way program instead of an alternative school. In 1989, the program was renamed First Nations School of Toronto (FNST). Then in 2018/2019, the school returned to its original roots and after a renaming ceremony, is now called Kapapamahchakwew - Wandering Spirit School. The school is home to diverse urban Indigenous students from K-12 and is an ethically safe place where Indigenous children are taught in culturally relevant ways and Indigenous philosophies are centered. (<https://www.tdsb.on.ca/Community/Indigenous-Education/Schools/Kapapamahchakwew-Wandering-Spirit-School>).

One of the outcomes of this pilot study was that the community and researchers recognized that there was an undeniable need for training on Indigenous trauma-informed practices of care. This led us to develop a graduate course designed for both student teachers and educators⁸ entitled *Weaving Together Mind, Body and Spirit: Envisioning Pathways to Trauma-informed Classrooms from Indigenous Perspectives* (the course).

It is well documented that many Indigenous students remain underserved by mainstream models of education and continue to struggle in K-12 classrooms (Battiste, 2013; Cote-Meek, 2014; Cote-Meek and Moeke-Pickering, 2020; Moore, 2017; Tomlins-Jahnke et al., 2019; Styres, 2017, 2020; Styres and Neepin, forthcoming; Styres et al., 2020). The history of violence against Indigenous peoples perpetuated by the residential schools,⁹ the sixties scoop¹⁰, the millennial scoop,¹¹ missing and murdered Indigenous women and girls,¹² numerous and continuing social injustices and Indigenous rights violations, along with the ongoing discoveries of mass/unmarked graves in Canada at former residential schools¹³ have left a legacy of extensive inter-generational and compounded trauma with Indigenous peoples. Chief Willie Sellars said in an interview regarding the unmarked graves uncovered at the former St. Joseph's Mission Residential School located on T'exelc territory in British Columbia, that "the horrors that occurred inside walls of the [residential schools] are still very real for those who lived them. And the legacy of these atrocities is still readily apparent in the numerous ways that intergenerational trauma manifests in First Nation communities" (Fenton et al., 2022, n.p.).

Tanya Talaga (2017) recounts the story of seven Indigenous high school students from remote northern First Nations communities who died and/or went missing over a period of 11 years while at school in Thunder Bay. These children were forced to move hundreds of kilometers from their families and communities to attend high schools in Thunder Bay because there were no adequate high schools in their communities. Stan Beardy, former Grand Chief of the Nishnawbe Aski Nation, said that "going to high school is the right of every Canadian child. But these children have been treated differently, their needs forgotten in a country that prides itself on having one of the best education systems in the world" (cited in Talaga, pp. 20–21). One of those seven students who died while attending high school in Thunder Bay was Kyle Morriseau, grandson of the late world-renowned artist Norval Morriseau and son of artist Christian Morriseau who created the painting entitled *Seven Fallen Feathers*, which is also the title of Talaga's book. Christian, after the inquest into the seven deaths was complete, felt mired in his grief not only over his own son's death but the death of all seven youths. Out from that grief the image of the youths as seven individual but interconnected fallen feathers was gifted to him by the Great Spirit (pp. 300–301). The painting represents the ways the hearts and spirits of those fallen feathers are placed in the hands of their ancestors "who wait for them on the other side" (p. 301).

⁸In the context of this chapter, student teachers refers to students within the Ontario Institute for Studies in Education's (OISE), Master of Teaching program. The understanding of educator relates to students within the discipline and/or profession of education in its broadest context. Education occurs across a variety of informal and formal contexts. The course *Weaving Together Mind, Body and Spirit: Envisioning Pathways to Trauma-informed Classrooms from Indigenous Perspectives* includes students from a wide range of backgrounds, cultural traditions and spiritual beliefs. In addition, students in the course are positioned within different educational/employment backgrounds and trajectories as well as academic/professional programming and streams (i.e. MEd, MA, MT & PhD). As such, unless otherwise specified, when referring to all of the students within the course, we will be referring to them by the collective term "students".

⁹Over 150,000 children were forcefully and violently removed from their families by various policing agencies, clergy and Indian agents, and sent to residential schools. Many times these children would be sent to residential schools at great distances from their home communities in order to discourage run aways and familial visits. These children were isolated from the influence of their homes, families, traditions, language, and cultures. The 2015 Truth and Reconciliation Commission Report documents stories of neglect, disease, malnutrition, and many other horrendous abuses. Residential schools were a leg-islated and institutionalized agenda of mass assimilation and cultural genocide. In 1920, amendments to the 1876 Indian Act made it legally mandatory for every Indigenous child to attend residential school. Parents who refused faced heavy legal penalties and were denied legal representation. There are an estimated 80,000 former residential school survivors living today. The residential school era lasted for 160 years. The last residential school in Canada closed in 1996.

¹⁰Patrick Johnston (1981, 1983) coined the term "sixties scoop" in a 1983 report on Indigenous child welfare commissioned by the Canadian Council on Social Development. The sixties scoop, which overlapped with the residential school era, lasted from the mid-1950's into the 1980's. It was a period of time where policies and practices were enacted in Canada that gave Child Welfare Services the authority to remove children from their families in First Nations Communities and place them in non-Indigenous foster homes and adopt them out to white families. It is believed that approximately 20,000 children (some newly born) were forcibly and/or coercively taken during this period of time and adopted out in closed adoptions. Their Indigenous identity, history, and familial ties were purposefully kept from these children. The Canadian government's policies and practices purposefully ensured that there was no traceable connection between the children and their biological families. As well, their birth records were closed.

¹¹This "epilogue to the systematic removal of children in the sixties scoop" (Nelson, 2019, n.p.) has been called by critics of the system as the millennial scoop. Ridgen and Andrews (2019) reports that the forced removal of Indigenous children from their families continues to happen today in Canada, often with little to no evidence that they were at risk of abuse or neglect. Further, that the continued government-sanctioned apprehension of Indigenous children from their kinship ties is a human rights violation (n.p.). "Cindy Blackstock, Executive Director of the caring society, says she sees case after case of First Nations children in trouble being sent routinely into care because that's where the funding is instead of trying to help families deal with their problems" (The Canadian Press, 2011, n.p.).

¹²Colonial violence against Indigenous women and girls is not a new phenomenon but has its historical roots in colonization and the entrenchment of settler futurities; the dispossession of Indigenous peoples and lands; and the systemic cultural genocide of Indigenous peoples through the implementation and perpetuation of Indigenous residential schools and the forceful removal of Indigenous children from their families. After the release of the 2015 Truth and Reconciliation Report, then Justice Murray Sinclair, Chair for the Truth and Reconciliation Commission, stated at the release of the report that an inquiry "for murdered and missing aboriginal women is a must, and further, that the government has flat out rejected the idea for years" (Rabson, 2015, n.p.). For additional information please read the 2019 *Reclaiming Power and Place: The Final Report of the National Inquiry Into Missing and Murdered Indigenous Women and Girls* (2019) written by the National Inquiry into Missing and Murdered Indigenous Women and Girls (Canada).

Indigenous peoples, their children, and communities who have been and continue to be impacted by historical and contemporary traumas and violences are the fallen feathers that situate our work. The Canadian [Truth and Reconciliation Commission's \(TRC\) 2015](#) report identified 94 calls to action with education as a critical site for reconciliation, healing and well-being. Reconciliation requires that educators identify the implications of settler colonialism on their educational and classroom practices, actively engage decolonial approaches to those practices ([Styres, 2020](#)), and appropriately integrate Indigenous perspectives and trauma-informed practices of care into classrooms.

Drawing from multiple conversations with community, students, and the experiences of the course instructors, this chapter reflects on some of the ways we engage with trauma-informed practices of care. We also examine themes of culturally and spiritually safe care in relation to the diversity of Indigenous peoples across Canada and the ways educators are implicated in colonial relations of power and privilege. We conclude with insights and lessons learned, and a consideration of the ways we can move forward to create more inclusive trauma-informed practices in professional and educational environments across diverse contexts.

Trauma, development and classrooms

We have changed our fundamental question from

"What's wrong with you?" to "What happened to you?"¹⁴

Trauma can be understood as experiencing/witnessing one, multiple and/or repeated threatening or harmful events resulting in long-lasting impacts on one's entire being ([Guarino and Chagnon, 2018](#)). Generally, traumatic experiences can include: abuse, violence, accidents, natural disasters, war, and ongoing systemic racism/oppression where one has "a close personal encounter with violence or death" ([Herman, 1997](#), p. 82). Although traumatic events may end at a point in time, witnessing/experiencing one or multiple traumatic events has the potential to change a person's physical and psychological responses to future real or perceived threats, can negatively impact the "psychological structures of the self", and "the systems of attachment and meaning that link individual and community" ([Herman, 1997](#), p. 121). Not everyone who has experienced a traumatic event is impacted by it in exactly the same way. The support one receives immediately following a traumatic incident, personal, socio-cultural and environmental factors all influence the degree to which trauma impacts an individual ([DuBois and Mistretta, 2019](#); [Guarino and Chagnon, 2018](#); [Linklater, 2014](#); [Siegel, 2010](#); [Van der Kolk, 2015](#)).

Because the course we are writing about in this chapter focuses on trauma-informed classrooms for children and youth specifically, it is important to understand the impacts of childhood trauma. Repeated childhood trauma such as sexual, physical and emotional abuse and neglect is defined as psychic abuse or complex trauma, which can result in long-lasting "damage on the psyche" ([APA, 2015](#), n.p.) This can include Complex Post-traumatic Stress Disorder (cPTSD)¹⁵ symptoms of emotional dysregulation, relationship difficulties, and a "negative self-concept" ([Hershler and Lee-Evov, 2021](#), p. 24), that includes feelings of worthlessness, guilt and shame. The diagnostic criteria for cPTSD also includes "re-experiencing" trauma through intrusive thoughts or mental images, "avoiding" reminders of trauma and feelings of being under threat in the present, where one may feel a heightened sense of being on alert for potential threats in one's environment (p. 24). To cope with and manage these symptoms, trauma survivors may use strategies such as substance misuse, self-harm, and risk-taking behaviors that may lead to additional trauma, guilt and shame ([Maté, 2008](#)).

Indigenous understandings of trauma are holistic in nature and recognize the spiritual impacts of trauma, where trauma and its resultant symptoms have resulted in an imbalance of one's sense of self; a "a soul wound" and "an injury where blood does not flow" ([Duran and Firehammer, 2017](#), p. 107; [Duran et al., 1998](#), p. 341). Generally, Western medical understandings of mental health focus on diagnosis and treatment of an illness, where "Indigenous healing begins with the Spirit" and connecting with self, others and the environment with an aim to restore balance and connection within these relationships ([Linklater, 2014](#), p. 125). In addition to individual experiences of trauma, Indigenous peoples' have experienced communal trauma in the form of multiple historical and ongoing traumas in present day, in the form of colonial violence, ongoing racism and oppression ([Burrage et al., 2021](#), p. 2; [Duran and Firehammer, 2017](#), p. 107; [Linklater, 2014](#), p. 14). Repeated instances of trauma, which has been experienced by multiple generations of Indigenous families and communities can result in "historical" "intergenerational" and "multi-generational" trauma where trauma symptoms and ways of coping are passed down through generations and "institutional patterning" via "blood memory" (Younging cited in [Linklater, 2014](#), p. 15). Colonial violence, racism, and oppression perpetrated against Indigenous peoples has been ongoing and continues to present day. [Linklater \(2014\)](#) asserts that "a vast majority of Indigenous people have lived, or are living in trauma; in most cases this trauma is multigenerational" (p. 20).

¹⁴Bloom, cited in [Perry and Winfrey \(2021\)](#), p. 19.

¹⁵The diagnosis of cPTSD has been included in the 11th version of the World Health Organization's (WHO) International Classification of Diseases (ICD-11) as of 2018.

Perhaps most relevant to learning about colonial and multigenerational violence perpetrated against Indigenous communities, families and children in relation to trauma-informed classrooms is the residential school system in Canada. Burrage et al. (2021) note that themes of loss - of identity and culture, of connection to self and others, of family violence, of "difficulties with parenting", and of destructive behaviors are all linked to the "intergenerational effects of residential schools" (p. 11). Given the likelihood of intergenerational transmission of trauma symptoms in Indigenous families and communities, it is important for educators to understand how Indigenous peoples may be impacted by attending educational institutions, when schools were places where generations of their families and relatives experienced violence, abuse and neglect.

Research shows that traumatic memories are stored in the brain and body. Further, that symptoms arising following traumatic experiences can have long lasting impacts on one's perception of the world and of themselves (Burrage et al., 2021; Hershler and Lee-Evoy, 2021; Siegel, 2010; Van der Kolk, 2015). Van der Kolk (2015) notes that "[a]fter trauma, the world is experienced with a different nervous system. The survivor's energy now becomes focused on suppressing inner chaos, at the expense of spontaneous involvement in their lives" (p. 110). In order to conceptualize how the brain is impacted by trauma, we can think of the brain having three main areas: brainstem, limbic region and cortex (Persaud, 2021; Siegel, 2010). The brainstem controls automatic body functions - breathing, heartbeat, digestion - and is the first part of the brain to develop. Our limbic region is involved in emotion creation, memory, and evaluative functions. The cortex is responsible for executive functioning and nervous system regulation is the last part of the brain to develop (DuBois and Mistretta, 2019; Siegel, 2010; Siegel and Payne Bryson, 2011; Van der Kolk, 2015).

When we are faced with a threat our natural and very necessary survival responses (fight, flight, freeze, collapse) kick in automatically. The amygdala, located in the limbic region, senses danger and quickly sends a signal to the brainstem to initiate a survival response, which "allows us to act before we think" (Siegel and Payne Bryson, 2011, p. 93). When these survival responses are activated, the prefrontal cortex goes offline¹⁶ - one is literally unable to think, reason, or learn. In trauma survivors, these responses can become primed over time to engage at even the hint of a real or perceived threat (Siegel, 2010). The overactivation of these survival responses puts enormous strain on one's system over time, and can have significant impact on the overall health of trauma survivors. Felitti's 1995 Adverse Childhood Experiences Study (ACE)¹⁷ found that there is a co-relation between experiences of trauma and neglect in childhood with increased depression, suicidal ideation, and addiction (Van der Kolk, 2015). The ACE study also found that people with 6+ incidents of adverse experiences in childhood had a 15% higher likelihood of developing major health problems such as heart disease and cancer (p. 289).

In addition to the findings from the ACE Study, experiences of trauma in childhood impact secure attachment, sense of safety, and brain function (DuBois and Mistretta, 2019; OFIFC, 2016), and children who experience neglect, abuse and poverty are "more at risk for delays in social, emotional and behavioral areas" (DuBois and Mistretta, 2019, p. 14). Some signs of trauma responses in children include: anxiety, difficulty concentrating, impulsivity, aggression, perfectionism, defiance and withdrawal (Cole et al., 2013; Guarino and Chagnon, 2018). Adolescents who experience trauma responses have lower academic achievement, social withdrawal, and engage in self-harming behaviors to cope with unwanted emotional and physical sensations associated with traumatic memories and frequent activation of survival responses (Guarino and Chagnon, 2018). Essentially, trauma experienced in childhood disrupts healthy development across a variety of markers. Strength-based approaches to understanding child development include Bruce Perry's Six Core Strengths for Healthy Child Development¹⁸ and traditional Indigenous Life Cycle Teachings.¹⁹ Children's brain and social development progresses in a scaffolded manner, where developmental milestones are dependent on mastery of the previously acquired skills. Perry describes the six core strengths of child development that follow the sequence of child brain growth as: attachment, self-regulation, affiliation, attunement, tolerance, and respect, with each core strength building on the previous one (Cole et al., 2013). Indigenous understandings of developmental stages can be illustrated using the Life Cycle Teachings model (OFIFC, 2016, p. 5) to understand the different roles and responsibilities we have at different stages of our lives, the strengths of being in each life stage, and the function of specific relationships between members of different life stages²⁰ (see also Wabano Health Center, 2017).

The ACE study also showed that childhood trauma is more prevalent in society than previously thought and, given the historical and intergenerational traumas Indigenous peoples' have experienced, it is likely that Indigenous students will experience trauma symptoms in the classroom (Cole et al., 2013; OFIFC, 2016). Teachers who have experienced or witnessed trauma (in or outside the classroom) also experience symptoms associated with burnout vicarious trauma and compassion fatigue²¹ (DuBois and Mistretta, 2019; Guarino and Chagnon, 2018). The good news is that human brains have the capacity to change especially during childhood - we have the capacity to form new neural pathways via environmental influences. Experiences of trauma can change our

²⁰According to OFIFC's Trauma Informed Schools Report, "the lifecycle wheel teaches us that we come into this world with a number of gifts from creation including our clans, songs, colors, and our unique gifts. When we are born we have a responsibility at each of our life stages though out the lifecycle. With each of these stages of life it is the responsibility of the opposite stage directly across from them in the lifecycle to support them in fulfilling their responsibilities. We see that when one of the stages is not acknowledged in fulfilling their role that their growth may be stunted, such as if an infant is not able to provide joy to a family because the parents are impacted from trauma, they may not be able to enjoy their infant the infant may fail to thrive or return to the creator. We can notice this with each of the life stages. It is a natural process to move through each of these stages if they are supported and allowed to fulfill their responsibility. If there is no support, we return to these stages of the life cycle again and again to complete our responsibility/journey" (Ontario Federation of Indigenous Friendship Centers (OFIFC), 2016, p. 48).

²¹See DuBois and Mistretta (2019), Chapters 4 & 5, pages. 41-76 for additional information on burnout, vicarious trauma and compassion fatigue. Symptoms include but are not limited to anxiety, low energy, decreased ability to focus, emotional dysregulation, and absenteeism.

brains and so can “good experiences”, therefore supportive interventions in childhood can serve as protective factors that foster resiliency (Cole et al., 2013, p. 19). Since it is likely trauma will show up in the classroom, trauma-informed teachers need to be able to recognize what the flight, fight, freeze and collapse responses look like and to identify the coping strategies that children and youth engage in to cope with states of dysregulation associated with these survival responses (Cole et al., 2013). Educators need to be equipped with this knowledge to support students, create safer classroom spaces, and reduce the likelihood of responding in ways that cause additional harm (Guarino and Chagnon, 2018).

When trauma symptoms and survival responses arise in classrooms, educators may initially view these symptoms as disruptive/disengaged behaviors. When viewed through a trauma-informed lens we begin to understand that these may be survival responses - activated reactions to perceived or anticipated threats (Cole et al., 2013; Dubois and Mistretta, 2019). In trauma-informed classrooms we aim to shift perspectives, to cultivate curiosity and compassion where, instead of asking “What is wrong with you?”, we ask “What happened to you?”. This fosters an understanding that ultimately these trauma responses are highly attuned self-protective mechanisms (Bloom, cited in Perry and Winfrey, 2021, p. 19; OFIFC, 2016). This requires that educators embark on a journey of un-learning taken-for-granted biases and assumptions in order to re-learn trauma-informed care within their own classrooms. Using this trauma-informed lens offers an opportunity for educators to respond mindfully and to support students who are in the midst of a survival response or using unhealthy coping strategies to alleviate their emotional pain (Cole et al., 2013; Maté, 2008).

A journey of un-learning to re-learn²²

We make the road by walking²³

Without a doubt our communities are still trying to heal from having survived historical and ongoing colonial traumas and continued attacks on our lands, rights, nations, communities, families and kinships. Styres (2017) tells us that every journey “is an expression of movement from one place to another by making a conscious and deliberate decision to move into unfamiliar territory while maintaining an observing and reflective frame of mind ... and that ... every journey begins with a single movement forward” (pp. 8, 178). As already said, the course was born out of working with settler student teachers who, as part of a research project,²⁴ were completing their teaching practicum placements in primary classrooms in Kapapamahchakwew. Our children are still shouldering the burden of these various traumas which undoubtedly manifest in classrooms and schools and it became very clear to us that student teachers are ill prepared to complete their practicum placements at Kapapamahchakwew. The student teachers themselves stated they did not feel equipped to understand the historical and ongoing trauma or the lived realities of Indigenous peoples. They expressed the need for relevant training to work with learners who have and are currently experiencing trauma and for the need to create culturally safe places of learning that do not continue to perpetuate harm. Our course was developed in response to these conversations.

The importance of Indigenous students seeing themselves and their ways of knowing and being reflected in educational spaces (schools, curriculum, classroom practices) is well-documented in Indigenous scholarship. Often, educators believe that being trauma-informed means avoiding difficult topics and conversations. This is a position that serves educators to the detriment of Indigenous students. Indigenous students need and want to learn about their histories and to be able to safely discuss their current lived realities. Instead of avoidance, educators should focus on how to teach difficult topics in culturally safe trauma-informed ways. It is far more harmful for Indigenous students to have their histories, current lived realities, and ways of knowing and being erased in schools and the curriculum – these erasures, regardless of intentions, are acts of violence (Styres, 2020). Educators often find teaching and learning about Canada’s colonial relationship with Indigenous nations disruptive and uncomfortable because they become enmeshed in relations of power, privilege, and complicity. This leads to entangled cycles of resistances – both their own and their students. One way that educators can move past these resistances and begin teaching Indigenous content is through a journey of un-learning to re-learn. This un-learning to re-learn is often messy and uncomfortable involving a critical examination of Canada’s colonial history with Indigenous peoples and how they, as educators and responsible citizens, are implicated in the ongoing oppression and dispossession of Indigenous peoples (Styres and Neepin, forthcoming).

Students in our course are often surprised to find that it is only after learning about trauma, its impacts on brain development, and how it is embodied, that they begin learning about Canada’s colonial history. Students tell us that much of what they learn in

²²You will note the use of hyphenation which is our stylistic way for emphasizing the prefix un- and re-. Un-as a verb refers to a shift, a turning-around, a change in the direction of an action, positionality or state of being. Re- as a verb means again, afresh, and anew – the repeating or redoing of an action or process.

²³Horton and Freire (1990), pp. 6, 7.

²⁴The research was a pilot study entitled Tutoring for Indigenous Children and Youth in Toronto. The pilot research sought to gain base-line information that would determine where primary students in their literacy achievement rates, what interventions were currently in place, how and in what ways are they/are they not working to increase literacies, what does the community see as key priorities in increasing literacies. There were four very clear outcomes from this study: (1) the need for an Indigenous focused trauma-informed graduate education course; (2) ethics of relationality are key in any literacy project with the schools/children/families; (3) the need for a literacy program that encompasses the unique needs of the diverse urban Indigenous learners in Tkaronto; and (4) the need for the development and implement of Indigenous focused readers and diagnostic tools. The data from the pilot study as resulted in the development of a larger research project focused on literacy development.

this second part of the course is new to them - it is not a history they learned in their own educational journeys. Students in the course report undergoing the uncomfortable journey of un-learning to re-learn in class discussions/assignments. With a significant portion of the course focused on colonial history and its traumatic effects on Indigenous peoples, midway through the course it becomes clear that many students begin struggling with the course content and become entangled in and overwhelmed by their discomfort. Due to their privileged positionality as settler educators,²⁵ this discomfort alarms them and they begin forming counter-resistances against their un-learning to re-learn journeys. Anecdotally, many students read the course title and believe they are going to take a course where they can process their own experiences with trauma. Students have stated expectations about learning “Indigenous healing methods” or “ceremonies”. When they realize the course is not group therapy, a personal wellness journey, or participation in “healing” ceremonies, there is a shift in attitudes and expectations that lead to additional forms of resistance stemming from predetermined unmet expectations. Many students bring into the learning environment their preconceived performative notions about the ways Indigenous instructors should act and how they should look. Students are often surprised and disappointed that the course does not include beads, feathers, medicines and ceremonies (King, 2003, pp. 61–68). Educators in general, have very specific ideas of how Indigenous peoples are supposed to portray themselves and be characterized by others. This is evidenced by a recent case of a teacher in California who dressed up in a home-made paper headdress as an “Indian” and performed “ancient legends,” dances and chants in her classroom (Salcedo, 2021). Similarly, educators have very specific expectations of how Elders are supposed to “perform” for them when invited into their classrooms. Students in our class also hold very specific expectations of how we were supposed to “perform” as Indigenous instructors – essentially, we were not the “Indian [they] had in mind” (King, 2003, p. 31).

Our course is a tightly woven tapestry of resistances and counter-resistances. The introduction of this course into a colonial institution along with our mindful pedagogical approaches to the provocative course content are the first resistances. Zinga and Styres (2018) tell us that:

Decolonizing and anti-oppressive pedagogies are, by their very nature, resisting mainstream approaches to teaching and learning, as well as challenging taken-for-granted assumptions embedded in the status quo. Resistance implies a very particular resistance to colonial and oppressive structures, whereas counter-resistance implies resistance to learning about or being taught decolonizing and anti-oppressive pedagogy. In the classroom, these pedagogies challenge the networks and relations of power and privilege that are systemically embedded in academia (p. 3).

Teaching a course that flips the narrative concerning Canada’s historical and contemporary relationships with Indigenous people is resistance that pushes back against the dominant colonial institutional, political and social (hi)story. Our instructor team and pedagogical choice of privileging Indigenous scholarship strengthens that resistance. The course is co-taught by two Indigenous instructors that continuously engage with and resist the imposed hierarchies of the academy (and by extension the students) and make the deliberate choice to team-teach collaboratively and model the “ethics of relationality” (Styres and Kempf, 2022) which initiates other resistances in the course. Immediately students begin to counter-resist our pedagogies and course content. They become increasingly uncomfortable with the un-learning/re-learning work that is required to move forward. As instructors we respond by deliberately creating safe and supportive spaces for students to work through their counter-resistances. For example, as students begin learning about Canada’s colonial history and ongoing relationships with Indigenous peoples, they write critical reflection papers based on course readings. We prompt students to critically examine their “mainstream taken-for-granted assumptions” (Zinga and Styres, 2018, p. 4), to sit with their discomfort, and to engage in deeper and more meaningful ways. The aim is to get students to begin thinking critically about what they are learning, to describe what they are feeling, to name those emotions and what they are attached to (i.e. guilt, shame, defensive) which, if unexamined, can lead to “settler moves to innocence” (Tuck and Yang, 2012, p. 1). As instructors, we too, much like Zinga and Styres (2018) experience an unwillingness from students to critically engage as they are “frantically trying to reinstate the illusion of the meritocracy, which provides them with a level of comfort not found in critical reflection” (p. 7). Students are required to participate in small weekly reading groups where each group member presents a deeply thoughtful reflection on their assigned readings. The students are also expected to keep a journal so they can reflect on the tensions, challenges, and pivotal learning moments each week. While the weekly reflections are focused on analyzing their experiences with the readings, the journal serves to document the students’ learning journey throughout the course. Together these weekly exercises scaffold students’ experiences in preparation for their final paper. Students are immediately resistant to and actively complain about the amount work there is in the course, while simultaneously saying that what they are learning is new and shocking information. In order to do the work of un-learning to re-learn, critical reflection is crucial and documenting this process is key because it demonstrates those pivotal moments where the students’ thinking was challenged, critically engaged, emotively processed, and eventually changed. This type of reflective thinking and writing is intense because it is not merely surface-level regurgitation of what was read but rather critically engaging with what is being read and learned.

Educators have told us they are fearful of making mistakes when it comes to teaching Indigenous content. They are afraid of saying or doing the wrong thing and they are afraid of being accused of cultural appropriation. Quite often educators look for ways to “tick the check-box” of teaching Indigenous content by inviting in Indigenous Elders into their classrooms for a one-off

²⁵To date, a large majority of the students registered in our course identify as white-settler: student teachers, teachers in K-12 classrooms, and educational practitioners.

visit to teach their class. The problem with this is the expectation placed upon the Elder to do the heavy lifting of teaching their learners – essentially doing their job for them. Asking Elders to come into the classroom/school to “perform” ceremonies, to drum and sing, or worse, to perform a rain dance is inappropriate and disrespectful. It is an extractive, exploitive and voyeuristic practice because Elders are literally being asked to perform “being Indian” for the class. Our Elders are very precious to our communities and are exceedingly busy doing the important work of healing and language retention/revitalization efforts. We do, however, encourage educators to cultivate meaningful relationships with local Indigenous community members/organizations. Instead of one-time invitations, this relationship must be ongoing and reciprocal. This could include inviting parents, grandparents, aunts and uncles, as well as local artists, musicians and community leaders into schools (Styres and Neepin, forthcoming) – it is also critical that schools obtain funding to pay honouraria to the community members for their valuable time. Educators must actively participate and co-learn along with their learners from the community member. Another aspect of the co-learning method of teaching and learning is for educators to bring Indigenous-authored teaching resources into their classrooms (Styres and Neepin, forthcoming). This method is ongoing and emergent promoting a continuing journey of un-learning to re-learn.

Due to the students’ own long-held and reinforced hierarchical assumptions, expressions of resistances were also found in the ways expected of us to “perform” Indigeneity in our roles as instructors. There were three simultaneous performance roles being unconsciously enacted by students in our classes (Karpman, 2016).²⁶ One instructor was often seen by students as the “rescuer” and represented the safe place for students to land. The other instructor was cast in the role of “perpetrator” and represented the difficult content and challenging work. Students would often shift in and out of the “victim” role whenever they perceived they were being victimized by learning about the traumas Indigenous peoples have and continue to endure. What the students were counter-resisting continuously throughout their performance as “victim” was that they (as a collective) could not settle their expectations - the feel-good part they craved without the painful stories - with the difficult, unsettling, and often uncomfortable journey of un-learning to re-learn.

Students clearly went through various cycles of resistances and it was somewhere within these cycles where the authentic learning occurred. It was through iterative circularity (Styres, 2017) that began with the introduction of the course into an educational institute and our pedagogical approach to the course content as the initial resistance to colonialism. The students’ engagement with the content triggered a counter-resistance which, in turn, we as instructors also continuously mindfully and purposely resisted through engagement with our pedagogical approaches to the course content. To help guide students through this, we held space and offered support as they strived to work through these difficult challenges. It is at this point, when the students look back at their learning journeys and are continuing to do the difficult work of engaging with course content, that re-learning through critical self-reflexivity becomes a reality. The (new) tapestry that we have been weaving in this course created opportunities for us to bring light into the shadow places. The very things that created resistances and counter-resistances are the same things that support interventions, mindfulness, purposefulness, and being present while also speaking back to institutional violence, oppression, and colonialism through education.

Closing the circle with feathers of hope

Of course, you don’t have to pay attention to any of these stories ...

Do with it what you will. Cry over it, get angry.

Make it a topic of discussion group. Forget it.

But don’t say in the years to come that you would have lived your life differently if only you had heard this story. You’ve heard it now.²⁷

Our story returns full circle to community by drawing upon some of the insights gained concerning the critical ways a graduate course could have implications for the overall health and well-being of Indigenous learners within K-12 classrooms. Instructors aimed to both model a trauma-informed classroom while also teaching students ways to incorporate trauma-informed interventions into their future practices. This approach facilitated both experiential and theoretical knowledge transmission.

²⁶Karpman’s Drama Triangle (KDT), is based on theatrical roles that contribute to a good drama and in the context of this work, provides a framework for understanding ways resistances showed up in our classroom. KDT was developed by Stephan Karpman in order to be able to understand different roles that people enact, and patterns we can find ourselves in everyday interactions with others. The main roles in Karpman’s Triangle are the perpetrator, the victim, the rescuer and the neglectful or innocent bystander. (Hughes, 2021). Each actor in the triangle may be in a re-enactment of a situation they’ve experienced in the past and each of these roles serves a conscious or unconscious purpose for the people occupying them (Hughes, 2021). People can shift between roles, or be pushed into different roles by each actor in a scenario.

²⁷King, T., 2003, *The Truth About Stories*, pp. 60, 119.

The trauma-informed interventions taught in this course included gaining an understanding of what trauma and survival responses are generally, how trauma impacts Indigenous people specifically, and culturally appropriate ways to teach Indigenous content using a co-learning/-facilitation model. Cole et al. (2013), tell us that trauma-informed teaching practices include: assisting students with emotional regulation skills-building, setting high academic standards for all students, creating safety (including recognizing and responding to bullying and harassment), behavior management and limit setting, using strengths-based approaches while cultivating a sense of agency by creating opportunities for students to have choices.

As we know that survival responses are activated when one's sense of safety feels threatened, maintaining consistency in class structure and building a connected classroom community are ways of creating safety in classrooms to support students' nervous system and emotional regulation (Cole et al., 2013). Course instructors sought to teach about and demonstrate consistency, emotional regulation, open communication and accessibility in supporting learners, especially learners who have survived traumatic events. As a means to establish consistency and safety amongst our community of learners each class began with a sharing circle and agenda review, followed by small group reading conferences, an emotional regulation exercise, course content, experiential exercises, and ended with a sharing circle. Sharing circles were aimed at creating community, highlighting out common humanity, and were guided by prompts to promote emotional awareness and to name key learning themes at the end of class. To promote wellness and create connections students engaged in experiential exercises that included: creating personal wellness plans; arts-based strengths exploration; Indigenous education and wellness tools; online sharing forums and reflections on healthy endings; and ceremonies that mark transitions in student's own cultural backgrounds, families, or personal practices.

As Indigenous instructors teaching about Indigenous trauma to a class of mostly non-Indigenous students, we were aware that we ourselves were susceptible to experiencing vicarious trauma and compassion fatigue in the classroom. Due to the interconnected nature of Indigenous community relationships, the topics we taught also impacted our lives personally. To support one another and our own emotional well-being, we held weekly pre-brief and debrief sessions. During these sessions we also discussed how best to support students who appeared to be distressed by course content or who were dealing with challenges in their personal lives. These sessions supported our capacity to be intentional about providing tools to support students' wellness as they learned about multiple traumas Indigenous peoples' have been subjected to. Students were invited to participate in grounding exercises prior to each class as a way to ground themselves during lectures and discussions. Remaining attuned to the needs of others while remaining emotionally regulated is a skill that educators can cultivate through grounding²⁸ and mindfulness techniques.²⁹ Learning ways to stay grounded is an essential skill for educators in trauma-informed classrooms and professional practices because educators need to be emotionally regulated in order to co-regulate with students in dysregulated states of hyper- or hypo-arousal³⁰ (Hershler, 2021; Siegel and Payne Bryson, 2011).³¹

We want to conclude with the following insights and stories that we have drawn from weaving together a tapestry of mind, body and spirit which is trimmed in feathers of hope. These insights and learnings from the course go beyond the "walls" of our classroom spaces and reflection papers into the practices of educators and other helping professionals. Many students reported at the end of the course that they underwent a significant un-learning and re-learning journey. Further, that they had gathered many knowledges and strategies to take with them and integrate into their own professional practices and lives more widely. Some students named their past resistances to acknowledging their own complicity in Canada's colonial history and the continued and ongoing oppression of Indigenous peoples and communities. These same students engaged in the deeply emotional work of critical self-reflection and shared their ongoing learning with their own students and colleagues. Practicing educators and student teachers shared that they took what they learned and created lesson plans and professional development sessions based on course readings/content and taught them to their own students or shared them with colleagues.

One story of hope and healing is from a student in our course who self-identified as a white-settler educator and who had worked in Indigenous community schools for a majority of their career. In addition to weekly critical reading reflections and journaling, they expressed their thoughts and feelings about what they were un-learning to re-learn through art. The student worked on a "living" painting that continuously emerged and evolved as they added to it. In the end, the painting showcased the student's own healing and knowledge journey. The student gifted us as the instructors with the painting before moving away to resume their work as secondary school teacher in an Indigenous community. This story is similar to another settler-educator who also dedicated their decades-long career to working within northern and remote Indigenous communities. This educator also wanted to share what they were learning in the course with her colleagues and was working on their graduate degree to become principal. This student started a book club utilizing core course texts and materials as discussion points. Another settler-educator who told us about their transformative experience with the course worked at an east Tkaronto middle school with a large population of urban Indigenous students. They said that much of the course content was new and very shocking and they had to work through un-learning what they

²⁸Grounding strategies are outward focusing practices that involve a variety of physical, mental or soothing techniques that can be practiced at any time during triggered states when the thinking part of the brain is offline (Peckham, 2021).

²⁹See Nicholson et al. (2020). Chapter 3: Building a Culturally Responsive Self-Care Toolbox. (pp. 99–138).

³⁰Hershler (2021), p. 26, notes that fight, flight and freeze are the survival responses often seen in states of hyperarousal, and examples of hyperarousal include: anxiety, fear, anger, physical tension and urges to flee, yell or fight. Hershler also notes that the collapse survival response is often seen in states of hypoarousal and signs of hypoarousal include: feeling sad, lonely, shame, numb, disconnected and tired, and an urge to "sleep or hide".

³¹Human beings are wired for connection through mirror neurons in the brain and, when we engage with someone in survival response mode, we may feel a similar response rise within us. This means that our own ability to think clearly may become diminished in the moment (Katz et al., 2018; Siegel, 2010; Siegel and Payne Bryson, 2011). This also means that, using the same process of relating through mirror neurons, when we are within our "window of tolerance" (Siegel, 2010, p. 138) in an emotionally regulated state, and we connect with a student who is in a triggered state, we create the conditions for the student's nervous systems to re-regulate in response to ours (Siegel and Payne Bryson, 2011).

thought they knew, re-learning history, while untangling their own complicity as both a settler and teacher. They developed and implemented a series of professional development sessions based on their learning which featured readings and materials from the course. They felt very strongly that other teachers at her school, especially those with Indigenous students in their classes, ought to learn what they had in the course. This kind of knowledge transfer and sharing is another form of hope and healing. Finally, some students were so moved that they sought to move into “action” based on what they learned in the class and reported “wanting to do something tangible to make positive changes”. One student developed a relationship with an urban Indigenous agency in the city that supports under-housed and homeless Indigenous people in Tkaronto. The student learned that the agency required personal supplies so they coordinated a class donation drive to give to the agency.

These are a few examples of the feathers of hope and storied conversations that were woven into our tapestry informing the journey of un-learning to re-learn in our course. We see that Indigenous practices of trauma-informed care can disrupt and challenge the ways educational practitioners remain entrenched in colonial relations of power privilege that continue to perpetuate harm. A critical insight gained is that, Indigenous understandings of trauma-informed practices of care are an important step in addressing historical and contemporary socio-political issues for Indigenous learners and what it means to be Indigenous in K-12 classrooms across a wide-range of contexts.

Introduction

The theme of the 2022 American Educational Research Association's annual meeting "Cultivating Equitable Education Systems for the 21st Century" obviously suggests that current systems are inadequate and that new, more equitable, systems must be established in order to support the advancement of all students. As we endeavor to improve on last year's direction recognizing that "Education researchers are not merely scholars; we are also citizens of the places in which our scholarship is produced, disseminated, and implemented. Equity and justice in these places depend as much on our deep thinking as they do on what we do with what we know. Racism, xenophobia, transphobia, Islamophobia, anti-Semitism, homophobia, and other manifestations of hate continually poison these places,"¹ we must recognize that these issues, while easily recognizable in others, might be operating surreptitiously within our own efforts to effect educational change. In an effort to create materials that promote "new" Hawaiian language literacies that reflect Hawaiian ways of speaking and knowing, we are unaware of the degree to which those efforts are guided by English worldviews, thus obscuring Hawaiian worldviews and Hawaiian ways of speaking that would distinguish it from English, and shield it from linguistic colonization, a patently inequitable process.

Obviously, in order to survive, Hawaiian, along with numerous other endangered indigenous languages, must be able to accommodate a 21st century world that has been inundated with English. As such, it is not feasible (let alone possible) to utilize some idealized version of the language that is completely pure and unadulterated by foreign influence, to include that imposed upon Hawaiians by English over the past two and a half centuries. Even if such a version had been hermetically sealed over that span of time and then suddenly made available to a community shielded from the effects of colonization, it would not accommodate our current linguistic needs. Moreover, having no actual shared experiential contexts with our forbearers, it would be quite challenging for us to understand their version of the language as they interacted with each other in communicative contexts. Given the heavy influence from English, and the number of generations that have acquired it, either along with Hawaiian or monolingually, its complete erasure from an emergent Hawaiian would be virtually impossible. Vigorous "updating" would be unavoidable. These efforts have been successful insofar as the overall number of new speakers is concerned, i.e., the number seems to have grown slowly along with levels of fluency, however, the range of topics that can be verbalized is not equally distributed across the speech community. Moreover, the "ways of speaking" that are reflective of a separate worldview, and which are not affected by advancements in technology, are fading into oblivion. We are so far removed that we don't even know what we don't know.

It is not our purpose here to avoid any particular ways of thinking or knowing merely because they derive from an English worldview, and neither did our ancestors. We recognize the value of foreign technologies and aspire to utilize them to our advantage. In fact, we see much of Western education as the vehicle for reshaping the English worldview that has possessed the community, and we have decided to confront these issues through the creation of materials that support a Hawaiian worldview and which will provide models for the use of Hawaiian ways of speaking that differ from English and are, therefore, not readily available to the vast majority of current Hawaiian language speakers and learners. This does not apply only to nascent speakers, but also to those who have been utilizing the language for years and even those who teach (and write about) the language. As we believe, opening pathways to discovery is critical, because the more you know, the more you know you don't know. However, it is important to maximize the use of all that has been bequeathed to us, finding ways to repurpose this inheritance for current contexts.

An infusion of Hawaiian into Hawaiian language

In an effort to infuse more Hawaiian into Hawaiian, our late colleague and co-author, Dr. Sam L. No'eau Warner (henceforth No'eau), developed some 31 books designed to supplement a severe paucity of reading material written in Hawaiian and available to school children, as well as the broader community. These were illustrated, published, and distributed free of charge to all families in the Hawaiian Language Immersion Program. The project was funded by a federal grant, called I Mua Nō Ka 'Ulu, that No'eau had secured in order to offer well-written, well-illustrated, children's books to the Hawaiian learning community. These books were designed both to increase interest in reading Hawaiian and to correct a number of English calques that can be attributed to the prominence of English in the wider community. Such calques were, and are still, ubiquitous throughout this new Hawaiian language speaking community. The name of the project itself was Ka Lau 'Ulu.

No'eau's books represent a shift in thinking about immersion education in Hawai'i. The fact that these books were "real" in that they were hard-covered and not merely cut-and-pasted translations of English texts was not lost on the students. For one thing, English words did not bleed through the cut-and-pasted Hawaiian translations as seen in previous efforts to create curriculum materials, and for another, they were not dependent on the English ideas presented in the originals. That is, the Hawaiian was written in Hawaiian without relying on thoughts and expressions translated from English originals. Such translations clearly led to a stilted version of Hawaiian among second language learners. No'eau's books were both written in Hawaiian and designed to address certain grammatical issues that represented calques of English thought. Also, the recognition that these were "real" books was, and continues to be, of great psychological benefit, reinforcing the legitimacy of Hawaiian language immersion as a viable avenue for education, i.e., it is a "real" program and not just an English program that has been translated into Hawaiian.

In order to reach the children, and to correct the calques from English, No'eau felt that it was necessary to "go where the kids are at", as he would often describe it. This became a guiding philosophy that pervaded his efforts. He felt that Hawaiian would be relatively easy for them to learn if it was appropriately contextualized. It could perhaps be said that this subliminal nature of conveying Hawaiian to children would result in a natural form of learning language that does not generally occur in the second language classroom. That is, they would internalize these patterns despite the heavy influence from the ambient English in the community.

No'eau harbored concerns about the status quo of a community in which "someone who knows very little can easily impress someone who knows nothing". He would lament the fact that a person could merely string together a few Hawaiian street names and, to the novice learner, or to the uninitiated, pass as fluent. He wanted the community to achieve a state of full proficiency, wherein a tiny bit of knowledge was no longer worthy of remark. That is, it would be common knowledge possessed by all, not unlike the common ability to evacuate one's bowels. He devoted much effort to helping the families of immersion children, many of whom had little or no Hawaiian language background, who might otherwise place the responsibility for revitalizing the language on the next generation. No'eau recognized that, for revitalization to occur, it would be necessary for the whole family to be engaged in the effort, and not just the children. He endeavored to promote the intergenerational use of Hawaiian as normal, in an attempt to secure its future existence. He wrote:

Thus, for Hawaiian language regensis to successfully occur, there is a primary need for

the intergenerational use of the language among children who have learned Hawaiian in

the immersion schools and their parents.

Warner (1999, p. 315).

To this end, he worked to convince parents to learn as much as they could in order to bring real success to the cause. As such, he focused on families and the normal verbal interactions in which they were apt to engage. He did a lot of work outside the classroom and face to face with parents, creating opportunities to learn the language in real language use situations. He wanted them to gain a real understanding of Hawaiian and not one that is confined to a single domain, i.e., one marked by academic jargon.² Language cannot live in the classroom. Its speakers must be able to participate in a wide range of communicative events. After all, language revitalization is a community wide project, not one that is confined to a single context. And to reiterate, it should constitute a real gain, and not one that can only be appreciated by the easily impressed. That is, language revitalization goals can be deemed successful when a person's ability to speak Hawaiian is considered normal, and worthy of remark.

In sum, we intend for this work to offer some valuable improvements to the current body of literature written in or on Hawaiian. In this case, that includes the creation of illustrated books that are ostensibly meant for children, but are also of benefit to adults who aspire to know more than a little, and who wish to support the goals they have set for their children. It is important to imagine the trajectory that Hawaiian would have taken absent the overwhelming influence of English. This would help maintain a Hawaiian

²See Warner, 2001.

worldview while incorporating current ideas initially conceived in English. It would also lead to the creation of new ideas in Hawaiian.

Throughout this paper, we will present examples from No'eau's books that illustrate some of the common calques made by English speaking learners of Hawaiian. We imagine that this problem is found in many indigenous language revitalization situations throughout the world, particularly when second language learners are interacting and validating each other's calques. This paper is not intended to be critical with regard to the progress that has been made. It is meant, instead, to promote an unwavering desire to improve on the status quo, particularly under adverse circumstances, and to transcend the inclination to rest on one's laurels.

There is a lot more that can be said about the quantum leap that No'eau's books created in Hawaiian language education, but the focus of this paper is on the targeting of particular ways of speaking common to English that have come to transplant commonly used traditional Hawaiian expressions. In the present context, unless supported through education, these traditions will certainly fall into disuse and obscurity. We borrow on the idea that we should not speak one language in another, i.e., speak English in Hawaiian,³ but aspire instead to speak Hawaiian in Hawaiian. Although there is no unanimity of thought, even in the Hawaiian language speaking community, as to what constitutes real Hawaiian, it makes sense that No'eau would try to bolster those areas in which traditional forms of Hawaiian could be identified and used in order to promote a traditional way of expressing thought within a current context. This requires a different way of thinking, one that is foreign to that found in our current community. With regard to linguistic constructions, vigilance in this regard will yield a Hawaiian that is ultimately less dependent on English, but that will provide a model of language use that influences English. For now, the concern is that the closer the Hawaiian is to English, the more suspect it becomes. We aspire to maintain separation.

The linguistic calque: a sticking point for Ka Lau 'Ulu

The following are examples of No'eau's attempt to deal with the problem of speaking English in Hawaiian, which we refer to here as calquing. He chose to address the problem via his Ka Lau 'Ulu project wherein he used children's books to attack the problem. He recognized that English speaking learners of Hawaiian assume that the two languages handle ideas in the same way. This assumption of crosslinguistic equivalence is a well-known problem in language learning, and most people know (or are apprised of the fact) that, adherence to such an assumption⁴ will increase the possibility that meanings will be lost in translation. We view such loss as a sign of success in language revitalization. It perpetuates the difference in worldviews. The examples below are taken from a selection of No'eau's books:

'Okō'a ka palaoa, 'oko'a ke koholā

There are numerous examples of calquing in the Hawaiian language revitalization context. As stated above, this was one of the primary issues No'eau's books were meant to target. The following example, the title of which is shown above, is intended to help clarify one such issue. Among a number of ways of categorizing concepts, it is possible in Hawaiian to show either a relationship, or a lack thereof, between two ideas that are being compared. This example, as taken from one of No'eau's books will focus on the latter. In comparing the *palaoa* (sperm whale) with the *koholā* (humpback whale), No'eau targeted a common calque from English. He recognizes that English was set up to utilize a preposition to express this idea. That is, the *palaoa* could either be different from the *koholā*

from 4. (to express discrimination or distinction): *to be excluded from membership; to differ from one's father.*⁵

or there could exist a difference between the *palaoa* and the *koholā*.

between 6. distinguishing one from the other: *He couldn't see the difference between good and bad.*⁶

In both of these examples the meaning of one is dependent on its relationship to the other. There is some kind of connection without which there would be no point of comparison. These are common in English. In Hawaiian, however, as No'eau illustrates by way of his book, the two items are independent entities. We say: *'Okō'a ka palaoa, 'oko'a ke koholā* (the sperm whale is independent, the humpback whale is independent). As our colleague Margaret Maaka⁷ had pointed out, one does not depend on the other to derive its meaning. Just imagine the traditional Hawaiian speaker learning English and instead of saying that one differs from the other, says instead that one is independent and the other is independent. That would be both strange and amusing. Unfortunately, the linguistic power imbalance between English and Hawaiian always seems to favor the English, ultimately leading to the production of Hawaiian forms for "from" or "between".

'Okō'a ka palaoa, 'oko'a ke koholā represents a different way of understanding the world. It is no more or no less valid than the English understanding. The fact that emergent Hawaiian language speakers are saying that one differs from the other, or that there is

³An obituary article appeared in the New York Times (July 22, 1982) after the death of the well-known linguist Roman Jakobson in which a fellow linguist stated, "Jakobson is a peculiar man ... He speaks Russian fluently in six languages."

⁴Grace (1981), pointed out the existence of what he called the "postulate of intertranslatability", a belief that a phrase in one language can be accounted for by its corresponding translation in another language.

⁵1989. Webster's Encyclopedic Unabridged Dictionary of the English Language. Portland House. 1989.

⁶Ibid.

⁷Personal communication, 2009.

a difference between the two, reflects the ongoing dominance of English in the community—even in the Hawaiian speaking community. Current Hawaiian language speakers are intent on conveying their ideas to an interlocutor, even if those ideas are founded on English thoughts. Although there may be several Hawaiian ways to do so that are more in line with traditional Hawaiian thinking, they are either unaware of their existence, or couldn't be bothered to make the effort. It seems, in such cases, that the English message, by infiltrating the Hawaiian medium, acts as a sort of double agent pretending to be Hawaiian. In this case, the medium has been corrupted, and the message effectively altered. Moreover, this apparently “unnatural” construction in Hawaiian is obviously much more difficult to master, or “normalize”, than simply using the calque. After all, everyone knows the calque. We submit that, in a language revitalization context, fortifying the medium and its use should be the primary goal. Whether or not the medium is really the medium here perhaps extends Marshall McLuhan's theory⁸ in a new direction. We believe, instead, that it is worth putting in the effort to learn the Hawaiian way of speaking Hawaiian.

Pupuka 'o hope o ka pīkake!

There are a class of words in Hawaiian that indicate spatial relationships between nouns. These are called ha'iinoa honua and they represent a closed class, i.e., the class is constituted of a finite number of members, and does not accept new members. The normal pattern in which they appear is as follows: ma mua o (in front of), ma hope o (in back of/behind), ma luna o (on top of/above), ma lalo o (under/below), etc. In these cases, mua, hope, luna, and lalo are examples of ha'iinoa honua. The preposition “ma” preceding these phrases can be glossed as “in, at, on, etc.” Other prepositions such as “i” (in, at, on, to, etc.), “mai” (from), etc., also appear in this pattern. This represents the strong pattern in the current Hawaiian speaking community. But these words can also be used as nouns, and it seems that No'eau wanted to show examples of that, in parallel constructions, but with noun markers instead of prepositions. In the title above, for example, we see the subject marker 'o preceding the ha'iinoa honua (hope) indicating that it is being used as a subject. Thus, the phrase *Pupuka 'o hope o ka pīkake* can be glossed in English as *the backside of the peacock is ugly!*

No'eau noticed that young and nascent learners were following the strong English pattern when constructing this type of thought. They would say: *Pupuka ma hope o ka pīkake!* ([Something] is ugly in back of the peacock!) which is awkward in Hawaiian, or: *Pupuka ka hope o ka pīkake* (The backside of the peacock is ugly), which, despite yielding an intelligible translation in English, is also awkward in Hawaiian. He realized that these learners had not been exposed to the entire range of possible uses for these words. As such, this book is ostensibly designed to offer the common Hawaiian way of expressing the ha'iinoa honua as subjects simply by using the subject marker 'o, a marker that does not have a gloss in English. The use of 'o here as a subject marker is a sign of sophisticated language use not generally exhibited by second language learners. No'eau recognized that the language of wider currency in the community, i.e., English, would seep into areas where a pattern is less commonly used, and second language speakers would be inclined, at least subconsciously, to reproduce it.

Finally, the word *hope*, as indicated above, can refer to the buttocks. Although this might be considered inappropriate by some, particularly for younger children, we believe that such ideas of appropriateness are also imported from English and are not applicable to Hawaiian mores. The use of such terms and the raising of such topics are both appropriate in Hawaiian, even for children. Words relating to body parts and bodily functions were traditionally not censored in Hawaiian.⁹ We believe that English values have supplanted the traditional Hawaiian values with regard to the use of these words. Having said that, it is quite possible that their censorship has contributed substantially to the level of interest in, as well as the humorous nature of their use in No'eau's books.

Pakalaki

This book is ostensibly designed to normalize several “normal” Hawaiian language grammatical patterns for second language learners whose first language is English, and for whom these patterns are not acquired as part of their normal first language experience, i.e., via exposure to the ambient language of a speech community. The differences between first and second language speakers, with regard to how they handle particular speech situations, can present problems for the second language learner. In other words, the constructions required in the second language can be significantly, and unexpectedly more complex. Being constructed based on a different worldview, they are likely to be handled differently. Due to this inherent complexity, their introduction to the learner is often delayed until later in the learning process, wherein they are explained via a comparison to English. The inherent difference between the worldviews of each results in the solidification of English versions of Hawaiian in those contexts. That is, novel Hawaiian forms of speech would ultimately be constructed and understood via English ways of thinking and speaking.

No'eau saw an opportunity to bypass this dependence on an English thought-processes when divining meaning from Hawaiian texts. By utilizing context and repetition, he sought to reduce the powerful influence from English on our understanding of Hawaiian. He utilized several patterns common to Hawaiian speech. The three patterns of focus in Pakalaki are listed below:

1. Akā, he keu 'o ia a ka pakalaki!
However, he/she/it was extremely unlucky!

⁸see McLuhan, 1964.

⁹See Wong and Warner, 2019.

2. I ka manawa a Pakalaki i pā'ani ai ma kahi o ka 'ilio ...
When Pakalaki played near the dog ...
3. ua nahu 'ia maila kona wāwae e ka 'ilio nunui.
His/Her/Its foot was bitten by the large dog.

The first pattern (1) utilizes the words "keu ... a" in order to convey a superlative sense of the level of bad luck in this context. This was ostensibly designed to promote a Hawaiian way of expressing the superlative that might prevent the spread of English options not traditionally utilized, such as "Ua pakalaki loa, loa, loa, 'o ia!" (He/She/It was really, really, really unlucky!). There are a number of patterns that can express the superlative, many of which are idiomatic such as "keu a", with "keu" representing an excessiveness that transcends normal experience, and "a" is a type of preposition that assigns that excessiveness to a particular trait. This is not an uncommon phrase in Hawaiian. It is heard in a number of popular songs. However, because it is idiomatic, there is no appropriate English equivalent upon which to construct the Hawaiian. Learners would either have to learn to think in Hawaiian in order to produce it, or experience its use until it is internalized at the subconscious level. The amount of bad luck experienced by Pakalaki in this story is a great way to internalize this pattern.

The second pattern (2) contains both a relative clause to express time and a locative phrase that indicates proximity. The relative clause *ka manawa a Pakalaki i pā'ani ai* (the time that Pakalaki played) is one of the more difficult patterns for students to acquire because there are numerous permutations of the pattern with the choice of one or the other likely based on the grammatical context. This particular relative clause is built on the phrase *ka manawa* (the time) providing more information about the particular time in question, i.e., *a Pakalaki i pā'ani ai ma kahi o ka 'ilio* (when Pakalaki played near the dog). Due to its inherent complexity, teaching the various permutations of the Hawaiian relative clause has been the bane of many Hawaiian language teachers. We do not flesh out all the various permutations here, but suffice it to say that it is considerably less complex in English. In our opinion, the nature of its complexity suggests that it was likely less commonly used in Hawaiian than in English. As such, the motivation of English speakers learning Hawaiian as a second language is that they will be able to express their English thoughts in Hawaiian, as suggested by Grace's "postulate of intertranslatability" (see footnote 4). No'eau recognized that consistently using the pattern in appropriate contexts would be the model that learners would internalize when reading his books or hearing them read aloud. This would make sorting out the grammatical complexities moot.

Also in the second example, we find a prepositional phrase that locates where Pakalaki played, i.e., *ma kahi o ka 'ilio* (near the dog). The Hawaiian construction is comparatively more complex than its English counterpart. For one thing, it contains the contraction *kahi* which is made up of two words, *ka* (the) and *wahi* (place). Instead of a single word, i.e., "near", Hawaiian employs the phrase *ma kahi o* (at the place of). No'eau recognized that students were trying to say "near" by using the word "kokoke" yielding constructions such as "ua pā'ani 'o Pakalaki kokoke i ka 'ilio" which does not conform to normal grammatical structures in Hawaiian. In other words, there should be a preposition to introduce the phrase, e.g., *ma kahi kokoke i ka 'ilio* (at the place near the dog). Resorting to English constructions clearly leads to unusual expressions in Hawaiian. This particular example has taken hold of a large portion of the current Hawaiian speaking community, and No'eau tried to effect change by influencing speech through his books.

In example (3), No'eau utilizes another contraction *kona* or *ka + ona* (the + of him/her/it). As we can see, the word *ona* here is also a contraction, i.e., *o + ia* (of + he/she/it). One of the lessons to be taken from this contraction is that Hawaiian does not have gendered pronouns. This offers a major benefit to the speaker of Hawaiian, that is, there is no reason to disambiguate the referent by utilizing pronouns appropriate to the gender, and all the current confusion that an ever-increasing array of English pronominal identities has created is simplified. Hawaiian utilizes the word *ia* to denote the third person singular pronoun. This accounts for he/she/it/or any other identity that is not included therein. Whereas identification via gendered pronouns is not an issue for Hawaiian speakers, it might not have been No'eau's intention to utilize this contraction as a lesson. English speaking learners of Hawaiian do not seem to struggle when the Hawaiian system is less complex than that of English. It is only when the Hawaiian is more complex that English speaking learners tend to struggle.

Also, in example (3), No'eau utilizes a passive construction: *ua nahu 'ia maila kona wāwae* (its foot had been bitten). English speakers, and writers, are more inclined to use the active voice. Thus, the English-speaking learner of Hawaiian is likely to favor the active construction that points more directly at the agent, which appears as the subject in the initial position. That is, it is much more accusatory than the passive construction that is common in Hawaiian, and in which case the agent is relegated to the third position: *e ka 'ilio nunui* (by the large dog), constituting a less direct, and less accusatory way of indicating the agent¹⁰. This is much more reflective of a Hawaiian world view that recognizes the power of words to visit tangible harm upon others. The importance of avoiding such harm is a way for a community to maintain social harmony.¹¹

Of all of the English influenced ways of speaking that No'eau's books were designed to address by offering Hawaiian alternatives, there are many still constantly heard. The net result is that such English constructions, due to the current lack of counter evidence, i.e., traditional alternatives, become normalized, and ultimately entrenched in the psyche of the second language speaker. That is the power of old habits. Even when we are aware of the appropriate alternatives, we are unable to make the change. The habitual form has worked its way into the subconscious level, not unlike "I mean", "you know", and countless others, to the point that we are unaware that we are actually producing them, even as we speak Hawaiian. We believe that No'eau recognized this and tried to

¹⁰See Wong (2006).

¹¹See Pukui et al. (1972).

do something about it for new learners before the English forms became fossilized. The counter evidence memorialized in his books offers an opportunity to make such a change surreptitiously, i.e., without confrontation, without risking social discord or embarrassment, and without casting blame!

The continuation of Ka Lau 'Ulu

After publishing and distributing the first set of 31 books, No'eau fell victim to a stroke and passed away after a long battle. This represented a tremendous loss for the Hawaiian language community. Although many people recognized the adverse impact English was having on Hawaiian, No'eau was really the prime catalyst for change as evidenced by the popularity of his books. The mere exposure to Hawaiian alternatives for expressing contemporary thoughts, as presented in an attractive and understandable context, supports the continuing viability of Hawaiian ways of speaking within current contexts.

As it turns out, Kapā'anaokaōle Oliveira, one of the co-authors of this paper and one of No'eau's mentees, found another 21 books that No'eau had developed until near publication ready, but had not published. She took it upon herself to seek funding to have the books published and distributed in exactly the same way that No'eau had done with the first set. Again, all the books were well-received, and because they target grammatical issues that are primarily calques of English, they are valuable lessons for a program that is the primary vehicle for creating new Hawaiian language speakers. The following are a couple examples of this effort.

Aia 'o Māmā i ke kaula'i lolo

This book represents the repetitive pattern of question and response in a basic children's story. The younger brother repeatedly asks his older brother about the current location of a certain member of the family. The older brother responds in a way that is appropriate in Hawaiian but strange in terms of its English translation. Here is the first example:

E Kua'ana, aia lā i hea 'o Māmā? (Hey, older sibling of the same gender, where is Mommy?)
'O Māmā? Aia 'o Māmā i ke kaula'i lolo. (Mommy? Mommy is located at the laundry hanging.)
Mai ho'oluhi aku 'oe iā ia. (Don't you bother her.)

No'eau has taken the opportunity here to teach several lessons. The first involves the appropriate use of the dubitative marker *lā* which is not commonly used by second language learners, and has caused confusion with regard to its syntax. That is, many people think the syntax is as follows: *Aia i hea lā 'o Māmā?* The question seeks to ascertain the location of Māmā which, from an English perspective, would be the information that is unknown. However, this marker in Hawaiian is located after the predicate *aia* denoting the existence of a subject in space or time, and not after the prepositional phrase *i hea* (at where). Obviously, children do not need to know the reason for the grammatical order, they just need to hear it occurring in the normal position on a regular basis. We believe that this lesson, and its repetition in each scene, was designed to reinforce the normal use of this word.

There is another lesson that occurs in this first scene wherein the word *Kua'ana* or *older sibling of the same gender* is used as the appellation for the older brother, instead of the first name as we would expect in English. It is spelled with an upper case "K" because it is a name that is akin to a title. Moreover, it represents the inherent responsibility relationship an older sibling has with a younger sibling of the same gender. In English, by comparison, it is not uncommon for the younger brother to call an older brother by his first name. In many cultures, this might be considered disrespectful.

Another feature that was important for No'eau to reinforce was the appropriate response to a question about where someone is. If it is a location that is being sought, that is easy enough. One merely names the place in a prepositional phrase. However, Hawaiian can also mark an activity as a location, as is done here and throughout the story. This is clearly the primary lesson. When asked where Māmā is, the older brother says literally that *she is at the laundry hanging*. Again, this seems awkward from an English perspective, but not any more so than an English phrase does when translated into Hawaiian, e.g., *How old are you?* *Pehea kahiko'oe?* Hawaiian speakers, like those of some other cultures, are interested in how many years one has, not how "old" one is. Using the Hawaiian word for old, *kahiko*, in this question would make little or no sense. There are numerous other examples that illustrate the perils of direct translation. These can even be humorous, but when the learner tries to apply the range of meanings of a particular phrase in the first language cross-linguistically, it does not match up with the range of its phrasal counterparts in the second language. Unfortunately, this is something of which second language speakers of Hawaiian (as well as other languages) are generally unaware. Left to their own devices, they are liable to speak English in Hawaiian.

He aha ka inoa o ka holoholona e umō mai nei?

In this book, the flap technique is utilized wherein the first page asks a question about which animal makes the sound written on the next page. Upon opening the flap on that next page, the reader discovers the answer, both in the text and in picture form. Throughout the book, each animal makes a unique sound. The first up is the cow, and it is the one that makes the *umō* sound that is presented in the title. The first page asks: *He aha ka inoa o ka holoholona e umō mai nei?* (What is the name of the animal that is *umō*-ing?) Upon opening the flap, the answer appears along with the picture of a cow: *He pipi ka inoa o ka holoholona e umō mai nei!* (The animal that is *umō*-ing is a cow!).

Another lesson that should be noted here is that, unlike humans, cows are not considered to speak different languages. Nonetheless, the sounds they make are represented differently in various human languages. Instead of the common English representation,

"moo", the Hawaiian is employed. For language revitalization efforts throughout the world, various sounds are likely represented in ways unique to the language spoken in particular areas.

No'eau recognized that the expression "*O wai ka inoa o ... ?*" (Who is the name of ... ?) is the form most learners use for articulating this question, which is prevalent in inquiries about the personal name of a third party not involved in the conversation. One of the first lessons second language learners encounter in beginning level Hawaiian language classes is the direct question to an interlocutor "*O wai kou inoa?*" (Who is your name?).¹² Note that the word "wai" is translated as "who" when asking about a personal name. No'eau realized that, at a number of levels (e.g., spiritual, taxonomical, and grammatical), the word "inoa" does not translate perfectly to "name" in English. In this case, the type of animal has a taxonomical name and the particular animal itself might have a personal name. That is, the animal is referred to at a taxonomical level by the categorical name "pipi" (cow), but it might have a personal name such as "Lani Moo".¹³ Thus, a question about its name is constructed differently based on the type of name being sought. "*O wai ka inoa o ka pipi?*" would yield a response such as "*O Lani Moo kona inoa*" (Her name is Lani Moo). Instead, "*He aha ka inoa o ka holoholona?*" would yield "*He pipi ka inoa o ka holoholona.*"

The difference between taxonomical names and personal names has been leveled for many current speakers of Hawaiian. The interrogative "wai" (who) has displaced its colleague "aha" (what) to become the only avenue of interrogation when seeking either type of name. As such, No'eau made this problem the primary target of this book. Interestingly, the English gloss for "what" is, in fact, the appropriate English interrogative for seeking either the personal or taxonomical name, e.g., What is the name of the animal? Its name is Lani Moo. It is a cow. Interestingly, that being the case, one might expect that "*He aha ka inoa o ... ?*" would have been calqued before "*O wai ka inoa o ... ?*"

Next steps

No'eau has left a valuable legacy providing a map for future efforts to develop curriculum materials that effectively support the continued efforts to revitalize the Hawaiian language, and he did so in a way that maintains Hawaiian ways of speaking and knowing. As Fishman has stated, this is not an exercise in "backwards looking"¹⁴ which would leave us stuck in the past as we strive to maintain authenticity. Instead, this is about maintaining those ways of speaking and knowing that are constructed upon past models as we move forward into the future. This would necessitate the inclusion of technological changes in current curriculum materials and curriculum development. That is, this must necessarily apply both to subject matter and medium of delivery. As such, it is important, as No'eau has said, to go to "where the kids are at". In the current context, this means leaving a digital footprint on Hawaiian education.

No'eau's plan inspired Kapā'anaokalāokeola to expand access to the books by making them available online as audiobooks. While ebooks and audiobooks are commonplace in English 21st century early literacy, this marked a milestone for Hawaiian immersion education. For the first time, children could access Hawaiian audiobooks online. No longer was the breadth of distribution bounded by the limited quantity of physical books produced on grant funding; rather, the entire collection of 52 books was digitized and uploaded to www.noeau.org. Overnight, the books were available to anyone with internet connectivity. To catapult the movement further, a native speaker of Hawaiian was employed to read the texts aloud so that children would be able to mimic the voice of a native speaker of Hawaiian. This was a game changer because for many children, this was the first time that they were hearing the voice of a native speaker of Hawaiian.

While new technologies expand access, we still believe in the continued production of physical books that promote the tactile learning process. The model presented by No'eau clearly does this, and more funding should be sought and secured in order to produce a wider range of genres while also targeting the ever-present calques from English. No language revitalization effort can really be considered successful if it is primarily beholden to English for the language that is ultimately generated. As such, No'eau's model would be extremely valuable to other language revitalization efforts throughout the world, particularly those wherein a dominant language has hijacked native thought. It does not make sense merely to express thoughts from the dominant language by utilizing vocabulary and grammatical structures from the target language. Attention must be paid to world view as well, and a world view that is independent from English can be found in both the grammar and vocabulary of traditional Hawaiian. The goal of No'eau's work was NOT to speak English in Hawaiian. He did not see that as a worthwhile cause. One could simply speak English in English if that were the case. It was, instead, to speak Hawaiian in Hawaiian, maximizing the use of the knowledge that has been bequeathed to us by our ancestors. He left a valuable model. It is up to us to step in and continue the movement on *ke ala o ka no'eau*, i.e., *the path of wisdom*.

It is up to us to sense the *hō'ailona* that our *kūpuna* have bequeathed to us so that we too can add new *'ike* to our knowledge base for subsequent generations of *Kānaka*.

Oliveira (2014).

¹²It should be noted here that the authors consider asking an interlocutor (second person) his or her name without establishing a foundation to do so is somewhat presumptuous from a Hawaiian perspective. In this case, however, it is not the focus of analysis.

¹³Lani Moo was the name of the mascot representing Meadow Gold Dairies in Honolulu. She was a cow who had been suffering from cancer and was recently euthanized during the second week of April 2022.

Glossary

Native American, First Nations, Indigenous, Native, Aboriginal: terms used interchangeably to identify the first peoples of the land in what is now the United States and Canada.

Introduction

This article will first cover the context of Indigenous language change and shift in the United States and Canada to provide the basis for understanding the need for language revitalization efforts. The campaign to eradicate Indigenous languages and thereby, their cultures, knowledges and traditional educational practices explains the overarching context for language change. This campaign created contexts of language endangerment where few to no speakers are left in some Indigenous communities. By some estimates, 90% of Native American languages are vulnerable reaching a point with no child speakers (Moseley, 2010). This first half of the article will also address the basis of the need for Indigenous language revitalization in terms of the important relationship of language to identity, wellbeing, and sovereignty.

Recognizing language change, Native American and First Nations communities have been involved in many types of language maintenance and revitalization efforts (Hinton and Hale, 2013; McIvor, 2009; Reyhner and Lockard, 2009). In the second half of this article, we move toward highlighting some of the diverse efforts for Indigenous language revitalization in the United States and Canada. While the article will privilege research on language immersion programs, schools, and efforts, it will also include community-based approaches with less research publication. Throughout the article, we use terminology in line with current research and framing of language change with limited use of damage-oriented terms (Tuck, 2009) that designate “loss” or “death.” Instead we use terms and framing that honor Indigenous languages’ important connections to identity, heritage, and living communities. In this sense, it is more respectful to describe languages as “sleeping” and with a focus on revitalization and wellbeing and as part of Indigenous “futures” (Smith et al., 2018). Smith et al. (2018) provide an eloquent description of Indigenous futures when they state,

We can use the word future to describe a time that comes after now, a time that we will come to inevitably. We can also use the word futurity, a word that imbues the future with what we are doing now to bring about different futures. The authors in this book attend to what we are doing now to bring about the futures we can’t even fully imagine yet. (p. 23)

We also use the terms Indigenous and Native as synonymous with Native American and First Nations. First Nations is a common term used in Canada, while Native American is common in the United States. We utilize both the terms language revitalization and language reclamation throughout the article, drawing on conceptual frameworks that do not limit such efforts to language-as-code and proficiency driven focus, but instead those that are implemented and experienced in Indigenous communities as guided by community needs, values, and goals, and grounded in Indigenous ways of being (Leonard, 2012, 2017; McKenzie, 2020). Finally, as we approach Indigenous language revitalization we offer critical questions with regard to some existing literature and its framing

of language change among Indigenous communities. The research we review here is only a sample of the extensive literature base that we wish we could include. While a comprehensive review would be beyond the scope of this article, we think you will find that the examples below provide an illuminating overview of current and emerging work.

Context for language change

Lomawaima and McCarty (2006) provide a thorough overview of the historical context for the campaign to eradicate Indigenous languages. The authors critically evaluate the historical educational landscape for understanding US educational policies and practices, which were aimed at the assimilation of Native students into the dominant American society through the suppression of Native students linguistic and cultural heritage. Interestingly, while those policies shifted over time between more and less oppressive, Lomawaima and McCarty argue they never leave the “safety zone.” The safety zone is a theoretical understanding where the authors argue that efforts to integrate Native American cultural and linguistic practices in schools have been allowed or disallowed based on whether such practices were deemed “safe.” That is, they did not threaten the ultimate goal of assimilation to an English language American identity. During some historical periods certain educational policies and practices have been deemed safe by federal agents because they posed no threat to American identity or economic superiority, while at other times similar policies and practices were considered a threat to that identity or American dominance and were therefore perceived as unsafe. In the end, Native American sovereign expression of linguistic and cultural heritage is held hostage through the power dynamics of federal policies. Lomawaima and McCarty raise important questions on the role of schools for creating American citizens, while at the same time fore fronting Native American peoples’ desire to control and oversee the education of their own people—a desire that eventually materializes in language revitalization efforts, among others.

In terms of learning about the trends in Native American language policy, Warhol (2011) provides a concise overview of federal, state, and tribal policies to demonstrate the shift in language policy to protect Indigenous languages. Warhol begins with an historical account of language policies as they were enacted in government boarding schools and moves to a discussion of policies in support of bilingual education. However, those policies were not necessarily focused on Indigenous language revitalization due to an emphasis on English-only. She then examines the Native American Languages Act and additional legislation that has helped or hindered Indigenous communities’ efforts at language revitalization. She ends her overview with attention to specific state and tribal policies as they have supported teacher certification, curriculum development and dual-language and language immersion education.

Similarly to Lomawaima and McCarty, Hinton (2016) argues that the state of endangerment of Indigenous languages today in the US and Canada is the result of state government suppression. Through schooling, policies, and laws, Indigenous languages were forbidden and repressed. However, schooling practices, policies, and laws starting in the 1970s shifted toward supporting their revival and sustainability. She also discusses the role Native communities have played to revitalize their own languages through immersion schools and innovation in pedagogical techniques for educators who learned their Indigenous languages as second languages.

In a more focused study on the impact of the campaign to eradicate Indigenous languages on Native youth, Romero-Little et al. (2007) examine the personal and learning experiences of Native youth as a result of language shift. Romero-Little et al. conducted 230 interviews, hundreds of hours of observations, and collected responses on 600 questionnaires from youth and teachers to understand their perspectives and experiences in this federally funded study called the Native Language Shift and Retention Study. Overall, they found that students and teachers alike valued English language but not at the expense of their Native language. Teachers also had a different perception than the students themselves of how much students valued their Native language. While 85% of Native students rated their Indigenous language as “very important” to learn and speak, only 29% of educators believed that Native students felt it was “very important.” Grandparents also had a stronger desire for their grandchildren to learn their Native language than did parents. Further, youth reported feeling linguistic shame, which meant feeling judged as inferior in social and intellectual status if they have an accent or if they demonstrated in front of their peers that they could speak the language. These findings are important for their implications on educational policy and practice. Federal and state policies at the time prioritized adequate yearly progress, which was measured by standardized English-based tests. These policies ignore the value of Native languages and center English-based curriculum, often through direct instruction methods that were lacking in substance and critical thinking, in order to improve test scores.

In response to such findings, McCarty and Nicholas (2014) offer insight into the roles and responsibilities of schools in reclaiming Indigenous languages. They explain the difference between natural language change and language shift, the latter being when the social structures supporting intergenerational transmission of language break down as a result of colonial or dominant control and suppression of Native languages. In this chapter, the authors review school-based language reclamation efforts followed by a thorough review of the language contexts, colonial policies, and Indigenous counter-movements and reclamation efforts across the US and Canada. They ask if schools, originally a site of Indigenous language destruction, can become effective sites for language reclamation. They argue it is the responsibility of schools to reverse the damage that they created before going on to offer a comprehensive overview of well-established, school-based (and community-based) language reclamation and immersion programs in several Native communities across the US and Canada.

In an example that highlights a wider range of potential factors influencing language shift, Spolsky (2002), who conducted a study on Diné (Navajo) language shift in the early 1970s, returns to the question of the influences on language shift to firmly

hold schools accountable for creating that change. But, he argues, larger, complex social, economic, and political contexts and influences also account for language shift among Diné people. He provides an overview of the state of Diné language and the state of Diné life across religious, political, economic, and educational settings, and across personal ideological perspectives, noting that language shift must be examined under this fuller sociohistorical context to understand contemporary conditions and to determine how to intervene.

Indigenous language change

This next section provides an overview of research that attempts to understand the stage at which language shift is taking hold and a critique of the perspectives under which Native communities and their languages are portrayed and understood.

McIvor and McCarty (2016) share that census data report that 169 Native languages are still spoken by 370,000 people in the US, and 240,815 First Nations people in Canada report speaking an Indigenous language at a conversational level in Canadian census data. While Krauss's research is more dated (1996), he provides a more nuanced understanding of the state of Native languages in the US and Canada by categorizing languages based on the age of the remaining speakers. Krauss claims 210 Indigenous languages across the US and Canada were still being spoken at the time of his research. He categorizes them into Class A – those with child age speakers and older, Class B – those with parental age speakers and older, Class C – those with grandparent age speakers and older, Class D – those with only elderly age speakers, and Class E – those language communities with no speakers left. At the time of his research, Class A had the smallest number of speakers, followed by Class B. Class C and D had the largest number of speakers. Like Sallabank (2012), he predicted that by the 2000s, between 20% and 50% of the world's 7000 languages would be at Class B or weaker. Sallabank predicted half or more would not be spoken by the end of this century. In her chapter Sallabank examines reasons for loss of linguistic diversity and what language policies can do to intervene. She discusses definitions of "language death" and notes how it is problematic to identify and assess when a language reaches "death." More so, languages exist through people and to suggest a language has died is to suggest the people have died. She provides examples of the many revitalization efforts of "dead" languages suggesting such use of the term is inaccurate and insulting. She continues to address the causes and influences that contribute to language shift and endangerment and deliberates measurements of linguistic diversity and health of languages. She reflects on the importance of linguistic diversity for the world and ends the chapter with a comprehensive overview of policies and practices that support languages facing more pronounced shift. What is unique is her assertion of policy makers as inclusive of government officials, language planners, community members, activists, members of language revitalization movements, as well as linguists or researchers.

Understanding language shift is complex, and while many scholars like Krauss provide much needed insight into that shift, other scholars like Sallabank convey the importance of discussing such change within a more holistic framework and less of a deficit-based portrayal, for the health and wellbeing of Indigenous communities involved in research. Fitzgerald (2017) argues that any discussion and predictions of Indigenous language vitality must include efforts at language revitalization in an effort to understand language change and shift through a framework based on Indigenous resilience, rather than a solely deficit-oriented focus on language shift, alone. In her commentary and literature review, Fitzgerald provides a thorough overview of efforts made by linguists and language communities to respond to language change, shift, endangerment, and loss. She synthesizes research for two decades of work in education, language revitalization, Indigenous studies, and health and well-being to inform conceptions and theories of language vitality and resilience. Her review includes key aspects of national policies, definitions of "language," metrics of vitality and success in language revitalization, and understanding the benefits of language revitalization. She asserts that defining the success of language revitalization in a holistic way accounts for better outcomes in health and education and supports findings that language maintenance and revitalization have benefits, while also acknowledging the negative effects of language shift within Indigenous communities in the US and Canada.

Benally and Viri (2005) and Lee and McLaughlin (2001) provide focused studies on Diné language of the US. Lee and McLaughlin present an analysis of social, economic, political, religious, and educational conditions that shape language and culture shift, and efforts to reverse it, within the Navajo Nation. They explain the status of Diné language in relation to each of the eight stages of Fishman's Graded Intergenerational Disruption Scale (GIDS) (1991), providing commentary on the appropriateness of Fishman's model for conceptualizing and working to reverse language shift. Benally and Viri assert that the Diné language is at a crossroads, from which it can move toward further decline, or toward a strengthened state through revitalization. They suggest the direction the language moves depends on Diné people and stress the importance of understanding the colonial (and internalized) influences to oppress Diné language along with the natural changes in adaptation to maintain a living language. It is important to note that Benally and Viri also explore the presence of "Navajo English" among Diné people, which is a form of English that has been influenced by the structure, accent, and cultural context of Diné language and people. They recognize Navajo English as a resource for strengthening Diné language.

Focused on another regional context, in a case study on the Indigenous languages of Oklahoma, Chiocca (2020) draws on Fishman's GIDS scale noted earlier to offer a critique of non-Native linguists and anthropologists' stances and viewpoints on language revitalization, arguing that Native communities must decide for themselves what constitutes success within the context of the demographic linguistic landscape of their communities. She shares examples of Native communities' language renewal efforts within Oklahoma and discusses their comparative growth and achievements. Importantly, she points out that it is the diverse contexts of each community's sociolinguistic environment that is important for understanding their linguistic goals and measures of success.

Basis of need for Indigenous language revitalization

This section will examine the relationship of Indigenous languages to Indigenous identity, wellbeing, and sovereignty. We position these relationships as the basis of the need for language revitalization in Indigenous communities. Grounded in the earlier described assertions that language change and revitalization must be examined more holistically in relationship to each community's social, historical, political, and other conditions, this section highlights scholarship and revitalization efforts within Indigenous communities who demonstrate the value and significance of their languages to identity, wellbeing, and sovereignty as aspects of Indigenous lifeways.

As will be shown in a later section of this article, Indigenous language immersion programs and models provide the most effective means for Indigenous language revitalization, encompassing approaches that enhance the holistically positive effects on learners. [Hermes and Kawai'ae'a \(2014\)](#) highlight immersion models in Ojibwe, Māori, and Hawaiian contexts. They illustrate how the nature of each program is shaped around building connections to family and community and result in influencing a strong language learner identity. Learners' language identities are strengthened and supported through immersion programs' revitalization of cultural traditions and practices and through reinforcing connections between learners' identities, languages and homelands.

The topic of the relationship of language to Indigenous young adult identity is taken up by [Lee \(2009\)](#) in her research with Diné and Pueblo youth. Her research investigated how young adults negotiate messages they receive about the importance of their Indigenous language for cultural continuity against messages of the need for English for success in the dominant society. The young adults in her study provided counter-narratives that demonstrated their perspectives of language and its relationship to their identity. Their perspectives were conveyed across five themes: respect for their language, experiences with stigmatization and shame regarding their language competencies, feelings and experiences of marginalization, these experiences' impact on their sense of their Native identity, and expressions of agency and ways to intervene to strengthen language revitalization within themselves, their families, and communities. Overall, regardless of their language fluency levels, the youth's sense of their Indigenous identity was not diminished. However, most of the young adults in the study expressed strong desires to improve their language fluency because of their value for their language and to increase their cultural knowledge through the language.

Related to identity is the issue of Indigenous wellbeing and its important connections to Indigenous language. [McCarty \(2020\)](#) addressed Indigenous individual and collective wellbeing by examining several Indigenous educational and communal program features that result in education for language revitalization and reclamation (ELR2) while at the same time recovering Indigenous practices of mutuality, relationality, respect, and equality. These features and practices lend to an environment that strengthens individual and collective wellbeing. McCarty cites examples from across North America and the Pacific to demonstrate these communal responses for revitalization and reclamation, approaches that take place in and out of school. She emphasizes the holistic nature of each community's approach in ELR2 within their unique sociolinguistic contexts. She concludes with how ELR2 influences wellbeing and holds beneficial implications for Indigenous self-determination, sustainable diversity, and social justice.

Pathways on a Language Landscape: A Planning Guide for Native Language Revitalization (n.d.) is a publication that was produced from a two-year planning process, a collection of Native community perspectives, and a conference in 2016 which gathered over 200 language educators, activists, scholars, community members, and leaders to share their visions for language revitalization. The guide is a framework of planning practices to aid Native communities in developing Native-led language programs. While providing an historical overview of language change in Native communities and a critique of the role of settler colonialism as the root cause for language shift and endangerment, the guide positions Native identity, wellness, knowledge, survival, sovereignty and liberation as the primary purposes for language revitalization and reclamation. It demonstrates the integrated relationships between these elements. The language landscape guide then provides nine common language practices, goals and strategies for achieving each practice, and shares resources for supporting Native communities' language planning. The guide is meant to engage all members of the community as a way to realize community renewal and building Native nations.

With profound implications for wellbeing, one Canadian study on the relationship between language use, other cultural continuity factors (such as land claims, education, and healthcare), and Indigenous youth suicide, pointed out that language use alone held a significant relationship with a drop in youth suicide rates ([Hallett et al., 2007](#)). Those communities where at least half of the population held a conversational level of knowledge of their Native language correlated with a suicide rate in their community that dropped to zero. Such results demonstrate that the more the Native language is present in a community, suicide rates are less. This suggests a direct, important connection between Native languages and wellbeing.

The research cited up to this point provides a holistic view of the connections between Indigenous languages and a variety of social and environmental factors that impact Indigenous lifeways. However, most unique, and perhaps most important, is the connection between language and Native sovereignty. [Blum-Martinez \(2000\)](#) argued that Pueblo languages should not be treated in similar ways to languages like Spanish in bilingual programs in schools. Pueblo cultures, histories, and communal and political structures view their languages and how they are taught or transmitted as to be controlled by their peoples for their communities. They are exercising their sovereignty through decision making about where, when, and how their languages are taught to their community members, and by whom. Blum-Martinez's work illuminates the fact that educational sovereignty is an act of community building and change to reflect community needs, resources, and goals.

Similarly, [Wilson and Kamanā \(2006\)](#) and [McCarty and Lee \(2015\)](#) discuss the significance of sovereignty and the role of schools in modeling the values and knowledge of the Indigenous communities they serve. Wilson and Kamanā raise the issue of a ban on Hawaiian language education as an attack on Hawaiian people as a distinct people with rights to learn and strengthen their language. They describe how Hawaiian-medium education has benefits that outweigh English-medium education and that do

not hold back students' progress in English language. [McCarty and Lee \(2015\)](#) also assert that Indigenous language education, and Indigenous education in general, must be advanced by Indigenous peoples. Native American language and culture programs operate in and out of schools in every state and US territory. In every case, these initiatives are embedded in the cultural context of local communities, highlighting the significance of context and place for creating a socially, linguistically, and culturally responsive learning environment. Thus, Indigenous experiences with language and cultural renewal are not homogeneous; while similarities and parallels can be drawn, what is appropriate in one context cannot be simply transported or translated to another.

Additionally, [Wong \(2004\)](#) critiques the academy, specifically Western institutions of higher education, with attempting to control the space for Hawaiian language. He asserts this is space that is still occupied by English, and explains the struggles Hawaiian language advocates still face to attain a space free of constraints and limitations.

In the next section, we share specific Indigenous language immersion programs and other language learning models across the US and Canada. This is not a comprehensive list, but it is a diverse list. [Hinton and Meek \(2018\)](#) and [Hinton and Hale \(2013\)](#) provide a comprehensive overview of the language revitalization movement, immersion models, mentor-apprentice, and other unique language educational approaches across Indigenous North America. The Green Book ([Hinton and Hale, 2013](#)) in particular moves away from deficit-oriented portrayals of the state of Native languages by sharing the optimistic and encouraging models showing success, while acknowledging the complex and challenging work of language revitalization.

Indigenous language revitalization and Indigenous immersion programs

Planning for Indigenous language revitalization

In order to see their languages thrive into future generations, Indigenous peoples of North America are implementing a diverse array of language revitalization efforts. Key to finding the approaches that work best for each community and language is the process of Indigenous language revitalization planning. Any and all community members and stakeholders can contribute to the process of planning for language revitalization ([Hinton, 2013](#); [McCarty, 2018](#)) and through collective input and decision-making Indigenous communities increase their potential for success, as they define it ([Gessner and Parker, 2020](#)). Because it is inextricably intertwined with socio-political aspects of life in Indigenous communities ([McCarty, 2018](#)), and because it involves multiple societal domains and constituent groups within them ([Gessner and Parker, 2020](#)), planning for effective Indigenous language revitalization must be holistic and comprehensive and must go beyond the short term to encompass a "Life-span approach" ([McIvor and Anisman, 2018](#), p. 101).

[McCarty \(2018\)](#) shares examples of the variety of ways that revitalization planning can manifest. Ranging from one person choosing to revive a sleeping language (not spoken for many years) from textual resources (see [Greendeer and Weston, 2021](#)), to large regional movements for cultural and linguistic revival (such as in Hawai'i), language revitalization planning takes many forms. Recognizing the complexities involved in such planning, and summarizing important lessons from practitioner-language planners, McCarty shares seven principles to aid in community-based language planning (CBLP):

1. "cannot be done to one or for one by others" ([Dauenhauer and Dauenhauer 1998](#), p. 97);
2. There are many CBLP pathways and no single vision or formula for "success;"
3. Language planning is community planning. CBLP is holistic and systemic;
4. CBLP requires a long view of the revitalization process;
5. CBLP requires ideological clarification and commitment;
6. "There is no language for which nothing at all can be done" ([Fishman 1991](#), p. 12);
- and 7. "Language issues [are] always people issues" ([Warner 1999](#), p. 89). ([McCarty, 2018](#), p. 30)

[Hinton \(2013\)](#) further provides nine stages for language planning for revitalization: (1) The Introductory Stage; (2) Goal Setting; (3) Preplanning and Research; (4) Needs Assessment; (5) Policy Formulation; (6) Goal Reassessment, and Developing Strategies and Methods to Reach Your Goals; (7) Implementation; (8) Evaluation; and (9) Replanning.

Indigenous immersion education

Recognizing that previous language education methods, including other forms of bilingual education, were not leading to the outcomes that they desired for their children ([Hinton and Meek, 2018](#)), one important approach to revitalization that Indigenous communities have turned to has been immersion education. Implemented in a multitude of ways, Indigenous immersion education is commonly understood as schooling in which the majority of instruction is carried out in the Indigenous language, often rooted in Indigenous ways of knowing and being ([Hermes and Kawai'ae'a, 2014](#); [Wilson and Kamanā, 2011](#)). Although they may have some similarities to world language immersion programs, Indigenous immersion programs are typically founded with the clear objectives of revitalizing Indigenous language, culture and lifeways. Representing Indigenous forms of resistance and refusal of hegemonic and assimilative US and Canadian systems of education, by "repurposing classrooms and schools," the work of such programs "is a de/anticolonial and restorative practice" ([McCarty et al., 2021](#), p. 350).

While other forms of Indigenous bilingual schooling emerged earlier, such as maintenance and transitional programs that were geared toward Indigenous learners who arrived to school with their Indigenous language as a first language, Indigenous immersion programs for learners beginning schooling with a dominant language (such as English or French) as their first language did not start in the US and Canada until the 1970s and 1980s. Early programs included a Mohawk immersion school in Kahnawà:ke ([McIvor](#)

and McCarty, 2016), and in 1984 the founding of the first Pūnana Leo language nest on the Hawaiian island of Kauaʻi (Wilson and Kamanā, 2011). Since that time, Indigenous immersion schooling has been initiated by numerous communities, with new programs founded each year across a wide range of settings and contexts. While it is common for a language community to have one immersion school, some languages such as Hawaiian and Ojibwe are now offered in multiple immersion schools. Often looked at as a leader in the Indigenous immersion movement, Hawaiʻi currently supports thirteen language nests (preschools) and twenty-seven K-12 immersion school programs (McCarty et al., 2021).

Among potential options for immersion education, growing numbers of Indigenous communities choose to implement immersion schooling with their youngest learners. Often drawing from the Māori programs that inspired such an approach, these programs are commonly referred to as language nests. Chambers and Saddleman (2020) note that, “A language nest is an early language learning program for young children from infancy to five years of age” (p. 27). These programs often have a goal of cultivating language in learners in ways that resemble natural forms of language acquisition, as closely as possible, often intergenerationally (McIvor and Parker, 2016). In an interview-based study focused on nests for languages such as Alutiiq, Hawaiian, Lakota, Mohawk, Ojibwe, SENĆOŦEN, and Tahltan, Okura (2017) examines topics such as what is necessary to start and maintain such programs, what resources they need, the challenges they face, advice that existing programs give, and the logistical and other differences and similarities among programs. Along with seeing positive language outcomes as children spent more time participating in the nests, Okura also notes family involvement, support and commitment as a “primary factor affecting success” in such programs (p. 156).

In line with McIvor and Parker (2016) she notes that there is great diversity among nests, some starting as grassroots initiatives, like those resembling “granny’s house,” while others might start with more formal institutional support – and that there is no one right way to create a nest.

Anchored in their experiences with a language nest in n̓kmapl̓qs in the Lake Okanagan Indian Band community in Vernon, British Columbia, Chambers and Saddleman (2020) document the history and trajectory of ns̓ylxc̓n language nests. Reflecting on their journey since 2007, they describe how the n̓kmapl̓qs program is “modeled on the extended family and intergenerational sharing of language and culture,” noting the positive effects on relationships between children and elders from the nest that “looks and feels like a regular home” (p. 37). They explain how the nest’s structure has evolved to incorporate split days - serving infants and toddlers early in the day, and preschool and kindergarten children later in the day. While the well-known example of the Pūnana Leo programs of Hawaiʻi continue to offer invaluable insights (see Wilson and Kamanā, 2011), as the number of language nests continue to grow, so too does scholarship on programs for languages like Keres, Xaad Kil (Haida language) and Tāltān (Moquino and Blum-Martinez, 2023; Young, 2019).

In addition to preschools or nests, a wide range of Indigenous communities in the US and Canada have founded K-6, and to a lesser extent, grade 7–12 immersion schools. In addition to some already mentioned, K-6 immersion schools for Cherokee, Cree, Salish, SENĆOŦEN, Blackfeet, Diné, Wōpanāak, Ojibwe, and a multitude of other languages now exist. As they nurture children beyond earliest years of development, these schools take a variety of approaches to curriculum and pedagogy, while continuing with the Indigenous language for all or a majority of instruction, and usually refraining from introduction of English through grade 3 or later (Hermes and Kawaiʻaeʻa, 2014). White (2015) provides a detailed account of one of the longest running Indigenous immersion programs, Akwesasne Freedom School (AFS). Founded in 1979, the curriculum and pedagogy of AFS is grounded in the Kanienʻkéha (Mohawk) language and traditional teachings, and arose out of a community movement for self-determination. Exercising significant control of its program, another Kanienʻkéha school that has enjoyed success is the Karonhianónhna Tsi Ionterihwaienstáhkwa of the Kahnawà:ke community in Quebec (Gomashie, 2019).

On the Navajo Nation the longtime immersion program Tséhootsooʻ Diné BíʻÓlta (TDB) was founded in 1986 to address the decline in speakers in Diné communities. Operating from grades K-6, and rooted in Diné philosophy of education, the school maintains high levels of Diné language instruction, consistently showing that students in the program perform academically as well or better than students in nearby English medium instruction programs (Arviso and Holm, 2013; Johnson and Legatz, 2006). Guided by the Diné Philosophy of Education, TDB operates according to the notion that all Diné relatives (and by that all staff at the school) are responsible for children’s Diné language development, which is facilitated by having a school space of their own (Johnson and Legatz, 2006).

Further emphasizing the need for these unique programs to have their own space, Blackfeet language immersion innovator Darrel Kipp warned, “that immersion schools demand a strong protective form of sanctuary” (Kipp, 2002, p. 4). Along with others, Kipp founded the private, non-profit Piegan Institute in 1987. The institute created the Nizi Puh Wah Sin Blackfoot Language Schools Immersion Program, which now encompasses three immersion schools for learners from grades K-8 (The Piegan Institute, 2022). The schools emphasize collectivism and cooperation over grades and competition in the language and identity development of their students (Kipp, 2002).

Seeking to establish immersion schooling that aligns with their own values, some communities have turned to educational approaches such as Montessori and Waldorf education in creating their K-6 schools. Two schools that have followed this approach have been the Weetumuw Katnuhtóhtákamuq Wōpanāak language immersion school and the Keres Children’s Learning Center of Cochiti Pueblo. Immersing their learners in Wōpanāak language and culture through decolonial learning that draws on community members’ knowledge and lessons learned at home in a caring, healthy environment that promotes self-efficacy and direction, the Weetumuw Katnuhtóhtákamuq school was founded in 2016 using Montessori pedagogy and now extends from pre-K through grade 4 (Greendeer and Weston, 2021; Wōpanāak Language Reclamation Project, n.d.). Similarly, the Keres Children’s Learning

Center (KCLC) of Cochiti Pueblo was founded in 2012. Recognizing parallels between Montessori approaches and Cochiti philosophy of holistic child development according to children's readiness, as well as goals of preparing children for culturally and spiritually grounded life guided by responsibility, respect and familial and community contribution, KCLC now hosts Keres Primary (ages 3–6 years) and Elementary Dual Language (ages 6–12) classes (Moquino and Blum-Martinez, 2023; Keres Children's Learning Center, 2022). KCLC has also led to the founding of the Indigenous Montessori Institute, which provides trainings in Indigenous philosophy of education and Montessori methods (Keres Children's Learning Center, 2022).

While the number of Indigenous immersion programs in preschool to grade 6 have increased significantly in the past two decades, both in the US and Canada, there continue to be few programs for grades 7–12. One program in British Columbia that reports programming through high school is the Chief Atahm School. Beginning as an early childhood program in the late 1980s the program serves Secwepemc members of Adams Lake Band, Neskonlith and Little Shuswap, and has now grown to offer schooling through grade 10 (Chief Atahm School, 2017; Michel, 2012). Another example is found in the highly successful program on the Lac Courte Oreilles reservation, Waadookodaading Ojibwe Immersion School. Founded in 2001, the school now serves children from grades K-8, with plans to expand into high school (Koran, 2021; Waadookodaading Ojibwe Immersion School, n.d.). Implementing culturally rich ways of learning driven by the natural cycles of their local environment, extending into secondary levels allows students at the school to build on the already fluid Ojibwe language they develop by elementary grades (Hermes and Haskins, 2018; Sullivan, 2019).

Perhaps the most well-known of US secondary Indigenous immersion programs are found in Hawai'i. Emerging with a pilot program in 1987 the Ke Kula Kaiapuni Hawai'i, or Hawaiian Immersion schools, provide instruction through the medium of Hawaiian in all subjects, usually introducing English language as a subject in grade 5. These programs now exist in a network across the islands of O'ahu, Maui, Hawai'i, and Moloka'i, with ten of the schools serving students at the grade 7–8 level and thirteen schools serving students in grades 9–12 (Hawai'i Department of Education; n.d.; Warner, 1999). One school on the island of Hawai'i.

Ke Kula 'O Nāwahīokalani'ōpu'u (Nāwahī), provides insights into the amazing potential of Indigenous immersion education. Offering K-12 programming, the school graduates high school students with a high sense of Native Hawaiian identity, who often return to Nāwahī or other immersion programs to contribute to Hawaiian language revitalization. At the same time the school has maintained a 100% graduation rate since 1999, and students graduate highly proficient in Hawaiian language (Wilson, 2021; Wilson and Kamana, 2011).

Hawai'i also provides an example for postsecondary immersion programs. College level Hawaiian language programming initially gained traction in 1982 as a four-year Bachelor of Arts program within the University of Hawai'i in response to calls from youth and elders. Later, along with programs at other sites, Ka Haka 'Ula O Ke'elikōlani College of Hawaiian Language was founded in Hilo, HI. Built upon the Kumu Honua Mauli Ola Hawaiian Philosophy of education, through the B.A. in Hawaiian Studies students complete rigorous Hawaiian language courses so that they can take all coursework through Hawaiian beginning in their second year (Wilson, 2020). Programs at the college have now extended to master's and doctoral levels, all of which can be completed in Hawaiian.

Elsewhere tribal colleges and other programs are creating unique college level programming. On the Navajo Nation, Diné College offers a bachelor's degree in Diné studies that is grounded in immersion and "aims to produce graduates highly proficient in the spoken Diné language, cultural teachings, and ways-of-thought, who embody these ways-of-being" (Diné College, 2020; McKenzie, 2020). Using another approach, with a goal of graduating teachers certified to contribute to language education and revitalization in their communities, the University of Victoria in British Columbia offers a sequence of programs that lead to a Bachelor of Education in Indigenous Language Revitalization, with extensive work in students' own languages. Another program in Canada, Kwi Awt Stelmexw, illustrates how community-based non-profit organizations can partner with postsecondary institutions to offer immersion programming that leads to college credit. They partner with Simon Fraser University to offer the two-year Squamish Language Proficiency Diploma through a full-time program of Skwxwu7mesh immersion learning (Chew et al., 2021).

Structural and contextual differences

Indigenous immersion schools in the US and Canada have successfully carried out their efforts within a number of structures and contexts. Contributing to the diverse ways in which these programs arise, one important characteristic that affects the schools significantly is their relationship to broader educational and governmental systems. Some immersion schools carve out space to operate under prescriptive regulation of state or federal school systems in the US Others, such as Nāwahī and Waadookodaading have operated successfully as charter schools that exercise increased control over curricular, pedagogical and other aspects. Still others, such as the Blackfeet schools founded by the Piegan Institute, and Akwesasne Freedom School, have chosen to operate as private, non-profit schools, independent of state and federal systems. In some cases, participation in broader systems can provide advantages like more stability, funding and facilities. On the other hand, participation as part of government regulated educational systems also comes with accountability to those systems, which often prioritize high stakes testing, and curriculum and pedagogy that do not reflect the learning sought by Indigenous communities, especially as they privilege English language (Hermes and Dyke, 2017; Kipp, 2002; White, 2015).

Related to their affiliation with larger educational systems, one prevalent difference in the ways that Indigenous immersion programs in schools can emerge is as either strand or stand-alone programs. While some schools such as the Blackfeet schools and KCLC have noted the importance of having a learning space dedicated solely to the Indigenous language (Kipp, 2002; Moquino and Blum-Martinez, 2023), it is sometimes more feasible for programs to begin and/or continue as a strand, or immersion track,

within an existing English medium school. This has been the case for a significant number of programs, including some Hawaiian medium programs and the Diné school Tséhootsooí Diné Bi'ólta' (May, 2013; Holm and Holm, 1995).

Another significant aspect in the diversity of schools is the places in which they are emerging. The majority of Indigenous immersion schools are found on the reserves and reservations of the peoples for whose languages they are founded. Yet, given an increase in the number of North American Indigenous peoples in urban areas (McIvor and McCarty, 2016), options for Indigenous immersion education are beginning to arise in cities that now occupy the ancestral lands of Indigenous peoples. One such school is Bdote Learning Center, a grade K-8 program named after the confluence of the Mississippi and Missouri rivers in the homelands of the Dakota people and present-day Minneapolis, MN. Although located in a large metropolitan area, the school, which has immersion pathways for both Dakota and Ojibwe languages, emphasizes interdisciplinary learning beyond the classroom, "tied to the geographical surroundings of the school, the local history, landscape, ecology, and Native languages and cultures" (Bdote Learning Center, 2021). Another urban-based program is Puente de Hózhq (PDH) in Flagstaff, AZ (Fillerup, 2011). A trilingual magnet school founded in a city with significant Native American and Latino populations, PDH offers both one-way Diné and two-way Spanish language immersion programs. With emphasis on academic rigor, and bilingualism, the school's infusion of culture, and presence of three languages, promotes their goal of multicultural competence. At the same time students regularly perform better academically than students who attend English medium schools in the area (Fillerup, 2011; McCarty and Lee, 2015).

Non-school-based ILR programs

While school-based programs continue to be common among ILR efforts in the US and Canada, a growing number of approaches outside of schools are also being implemented by Indigenous communities to support revitalization. Recognizing the need to increase the number of adult speakers who can foster language revitalization with all ages, a number of Indigenous communities have begun adult language immersion programs. Multiple programs of this kind have been developed for Kanien'kéha (Mohawk language). Programs have been established in the communities of Kahnawake Territory, Tyendinaga Territory, Wahta Territory, Six Nations Territory and Kanatsiowhareke Territory (Maracle, 2002). These communities reach across both the US and Canada. The community-based Onkwawenna Kentyohkwa (Our Language Society) program, for example, operating as full-time adult immersion program since 1999, has seen 140 students complete its program, many of whom have become teachers of the language, themselves (Gomashie, 2019; Onkwawenna Kentyohkwa, n.d.). Another program, Ojibwemotaadidaa Omaa Gidakiiminaang (OOG), offers immersion language learning through winter weekend and multi-week summer immersion academies aimed at helping learners build advanced language skills in Ojibwe. Initiated by Fond du Lac Tribal and Community College, and other Ojibwe revitalizers, OOG incorporates a variety of first language speakers and focuses on diverse contexts to prepare learners to eventually live everyday life in the language and contribute to language revitalization themselves (Erdrich, 2013; Ojibwemotaadidaa Omaa Gidakiiminaang, 2020).

Another approach to ILR that has become prevalent in recent decades is the Master-Apprentice Language Learning Program (or Mentor-Apprentice Language Learning Program) (MAP). Within these programs fluent speakers (often elders) are paired with adults who are committed to learning the language in one-on-one or small group settings. Based on immersive language interaction between the mentor(s) and apprentice(s) in the Indigenous language over extended periods of time, such programs promote language use and development on a regular basis and in a wide variety of life situations. In these programs the goal is often not just for the apprentice to learn, but for them to be able to pass the language on to others, as well (Hinton et al., 2018). Although Mentor-Apprentice Programs may be particularly helpful in situations in which there are very few remaining speakers of a language, or in which immersion schooling is not immediately viable or desired, they are not limited to such contexts, and can be implemented in a variety of situations and settings.

Since the 1990s Advocates for Indigenous California Language Survival (AICLS), the group who developed the MAP program, has trained more 100 Mentor-Apprentice teams in California alone, and the First Peoples' Cultural Council (FPCC) in British Columbia has supported 97 apprentices in 28 different languages in British Columbia (Hinton et al., 2018). Jenni et al. (2017) find that the programs not only cultivate language, but that they also have positive effects on cultural and spiritual health, as well as participants' engagement in their communities. In addition to experiencing success with many California languages the programs have been implemented for languages as far and wide as Chickasaw, Cherokee, Dakota, Euchee, Karuk, Ojibwe, Potawatomi, Sauk, Tlingit, Wompanaak, and Yakama, among others (Chew, 2015; Chew et al., 2021; Gordon and Huggins, 2020; Hinton et al., 2018; Morrison, 2020; Twitchell, 2016).

Other innovative approaches being created by language revitalizers place increased focus on the immersion environment. Based on her work with the Nsyilxcn language in British Columbia, Johnson (2013, 2017) describes a language house approach in which a group of committed language learners and facilitators come together to live in a house for five months, experiencing and supporting each other through significantly more language learning and use than conventional classes can offer. Supported by elders and focusing on curriculum development and assessment methods, along with the personal journeys of participants, Johnson demonstrates how such an intensive effort can lead to multiple resources for revitalization extending beyond individual participants and into the community. Focusing on another setting, some ILR efforts are drawing on the power of Indigenous connections to lands to facilitate language learning. Land-based approaches to immersion illustrate the importance of learning experiences on traditional homelands in creating the conditions through which learners can experience the relational and spiritual connections in which Indigenous languages are grounded (McKenzie, 2020; Rorick, 2018). One initiative has even turned land-based immersion language efforts into a comprehensive lifestyle. Reclaiming traditional homelands to found an off-grid community, the Ekvñ-Yefolecv

Maskoke ecovillage surrounds learners in the Maskoke language through prioritizing focus on traditional ecological and agricultural knowledge (Ekvn-Yefolecv, 2021).

While the number and diversity of Indigenous immersion programs continues to grow in the US and Canada, there exists a growing need to understand the similarities and unique aspects of these programs while also building a better understanding of how they affect learners, families and communities. To that end a multi-year multi-site, mixed methods study is currently underway to document and shed light on a diverse array of such schools. Sponsored by the Spencer Foundation, the Indigenous-Language Immersion and Native American Student Achievement Study will draw from quantitative work, as well as rich qualitative analysis to highlight both key commonalities and unique features of such programs (McCarty et al., 2021).

Challenges and supports to Indigenous language revitalization

One of the most prevalent challenges facing Indigenous language revitalization efforts is the declining numbers of first language speakers. Even languages with the largest number of speakers are seeing very few young people raised with the ability to speak their Indigenous languages. This situation is exacerbated by the ongoing assimilative environment fostered by hegemonic policies that prioritize English language and Euro-western knowledge as the basis of education in the US and Canada (Hermes and Dyke, 2017). Without adequate financial and other forms of support for Indigenous language medium education, Indigenous communities find themselves constantly lacking facilities, curricula, and training for teachers and program leaders, among other crucial resources (White, 2015). This often leads to situations in which insufficient time will be devoted to learning through the Indigenous languages (much less multi-year, full-immersion programs). Relatedly, those school-based programs that do exist have difficulty extending beyond grade 3 or 6, limiting the amount of language development that would be attainable if programs could run through grade 8 or even grade 12. Further, ideologically, in the Euro-western capitalist societies of the US and Canada, lack of support from government and educational leaders likely fuels what some have recognized as false perceptions that immersion education through a child's Indigenous language will be detrimental to their success in academic pursuits, and life in general (Kipp, 2002; Sumida Huaman, 2020).

Despite the challenges facing ILR initiatives, Indigenous communities are finding ways to contribute to revitalization of their languages. The rapid growth in programs that are being initiated and the ongoing success of programs across the continent for more than two decades, such as those described in this article, illustrate the unwavering resiliency and increasing momentum for revitalization efforts. Indigenous language revitalizers are working to build and sustain networks, both within and outside of institutional spaces, in grassroots community initiatives, and as individuals, to share resources through conferences, trainings and other forms of knowledge sharing and encouragement. ILR teacher training programs and scholarship around successful programs and approaches to ILR are increasing. Practitioners and communities are innovating with apps, programs, social media and other forms of technological resources that extend and expand learning opportunities beyond anything seen before. Perhaps most significantly, growing numbers of Indigenous peoples, from all walks of life, elders, youth, educators, researchers, speakers, learners, are all building awareness of and joining in Indigenous language revitalization initiatives for their languages.

Conclusion

Although Indigenous peoples in the US and Canada have endured assimilative oppression of their languages through settler states and their educational systems, ILR movements represent Indigenous communities' unwavering commitment to their sovereign abilities to maintain their languages and identities. Indigenous peoples are demonstrating their abilities to reclaim and nurture their languages and identities for generations to come through a diverse range of ILR approaches. On one hand these approaches are characterized by return to traditional conceptions of the purposes, meanings, uses and settings for Indigenous languages that differ significantly from predominant notions of education in mainstream society. In other instances, ILR approaches are embracing ways to innovate using contemporary systems and tools, repurposing them for the decolonial and re-Indigenizing goals of Indigenous language revitalization as defined by Indigenous communities, themselves.

With this in mind, the ILR movement can benefit from further research to address both its ongoing and recent successes, as well as current obstacles and challenges facing ILR approaches across North America. For example, the initiatives of previously discussed land based language immersion to influence comprehensive lifestyle change are promising and exciting. Learning about the holistic impact of these types of initiatives is significant for other communities to learn from and emulate. Similarly, further research on uniquely Indigenous immersion pedagogies, as well as the role(s) that Indigenous educational philosophies play in ILR will contribute to greater understanding of the holistic connections in the ILR movement. Conversely, further research on the continuing imposition of colonial structures on ILR, such as through state policies and funding that privilege English, is necessary to improve the ILR movement's understanding of how to intervene and confront mechanisms that continue to constrain and undermine ILR initiatives. Finally, further research on the challenges from within our own Indigenous communities is vital for ensuring community investment and the most potential success in the ILR movement. Addressing these challenges, including the internalized oppression of our minds toward our languages and lifeways, require what Smith calls for in "conscientization" (2003). Further research in these areas (and more) can contribute to the ongoing development and increasingly positive outcomes of ILR programming, and ultimately to the momentum of the ILR movement.

Across North America Indigenous communities are intentionally mobilizing in strategic and creative ways to re-conceptualize education for all ages of community members according to Indigenous aspirations for life, with Indigenous languages at the center. While similarities exist among the growing number of ILR initiatives, communities are increasingly focused on identifying the approach(es) that best fit their context and situation to promote well-being for their people, now and in the future.

Introduction

Portuguese was the first European language to be spoken in what is present day Nigeria in the 15th century. This period marked the first European entry into the West African coast. The English language came later at about 1553 when English men visited parts of the Ancient Benin Kingdom and Old Calabar areas of present day Nigeria. In spite of the fact that English came much later after Portuguese, the language has assumed a place of prominence which is not challenged by any other international language nor any of the over 500 indigenous languages spoken in Nigeria. This dominance is understandable following Nigeria's colonial history and the entrenchment of English as an official language even after independence in 1960. The fact that English is used as the medium of instruction and a subject of prestige in the school system is another factor. Not surprisingly, the place of English, especially its role in the educational system, has been a recurring decimal, that is, an issue that keeps occurring (Bamgbose, 2020) in the various educational enactments, policies, pronouncements and planning in relation to language and the language of education from the 19th century to the present. From the advent of English in Nigeria through the era of missionary and colonial activities to independence and post-independence periods (Adetugbo, 1979; Awonusi, 2004), English has been so entrenched that it is accepted as the language of integration and social cohesion within the Nigerian linguistic complexity. For some young Nigerians, especially those born and raised in some Nigerian urban centers, English, and Pidgin English in some cases, is not just a second language, but indeed, a first language. It is a home language and for some it is the only medium of communication and the preferred language of choice for this class of Nigerians (Egbe, 2014). This group of young Nigerians might choose to learn a second or an additional language for instrumental reasons.

The place and role of English in Nigeria's educational system vis-a-vis literacy learning is so central that when concerns are raised regarding the quality of education, people rather point at the performance of students in both their spoken and written English. There is therefore the tendency to measure educational standards in terms of how students perform in English both as a medium of instruction and as a school subject. The linguistic plurality of Nigeria appears a fertile ground to harvest the linguistic resources of English in Nigeria. The Englishization process is not challenged by any other foreign language in Nigeria nor any of the over 500 indigenous languages.

The focus of this paper is to examine the dominance of English in Nigeria conceived as Englishization in relation to the language of education in Nigeria, explore the concept of Englishization and identify the literacy issues and challenges in Nigeria given the dominance of English as well as highlight the prospects for Nigeria as a member of the global community contributing and shaping world Englishes.

Conceptualizing Englishization

Englishization as restlessness

Historically, English has been a restless language looking and searching for lands to invade and conquer. Since English itself is a product of conquest dating back to the invasion by some Germanic tribes (Angles, Saxons and Jutes) in AD 499, the behavior

of English should not come as a surprise. From inception therefore, English has remained “a language of conquest often and always seeking newer territories and peoples to dwell with ...” (Egbe, 2019: 4).

The dispersal of English from its ancestral birthplace to the present can be summarized in four waves. The first transportation of English started from within the British Isle when the language was taken to Scotland, Wales and Ireland (King, 2020; Douglas, 2020). This is regarded as the First Diaspora dispersal which was essentially internal. This was followed by the external Diaspora transcontinental re-rooting of English to United States (1584), Canada (1497), The Caribbean (early 1660s), Australia (1770), New Zealand (1769), and South Africa (1795). See Schneider (2020), Dollinger (2020), Kiesling (2020) and Aceto (2020). This is regarded as the Second Diaspora Dispersal. The Third Diaspora Dispersal accounts for the dispersal and planting of English to the South and South East Asia (1600s), former African British colonies (late 1600s), and South East Asia (1770s). See Gargesh (2020), Low (2020), Kamwangamalu (2020) and Bokamba (2020). The Fourth Diaspora Dispersal accounts for English in the South Pacific countries (1770s), English in South America, English in other parts of Europe including Russia, and parts of East Asia as well as English in the People’s Republic of China (Friedrich, 2020; Hilgendorf, 2020; Proshina, 2020; Honna, 2020; Zhang et al., 2020).

The journey of English from a local language of about four million speakers in the 15th century when “... English was the language of Englishmen” Strang (1977:156) to an international language with about 1.5 billion speakers representing 20% of the 7.5 billion of the world’s population (Lyons, 2017), the language has taken up diverse communicative, cultural, economic, educational and political and administrative responsibilities across the globe. In fact, Kachru (2020:454) listed the following as the functional domains of English in its status as the world’s lingua franca: the language is used as an access code, for advertising, corporate trade, development, government, linguistic impact, literary creativity, and literary renaissance. Others are its use in news broadcasting, newspapers, scientific higher education, scientific research and social interaction.

The dominance and centrality of English evoke fears and concerns. The global murderous march of English has earned English charges of “linguicide”. Schneider (2003:233) notes that “English ... has been damned as a ‘killer language’, responsible for the extinction of innumerable indigenous languages, dialects, and cultures around the globe”. The same fear is echoed by Crystal (2001) when he recalled Jim Erickson’s big question: “Will the English-dominated Internet spell the end of other tongues?” in Erickson’s article, “Cyberspeak: the death of diversity” (*Asianweek*, July 3, 1998, p. 15).

Whatever the apprehensions are for English, some scholars think English has come to the rescue of many. In fact, Kings (2020) regard English as “a gift to the globe, to millions of people, often to people who would not be able to express themselves to a wider audience if not for English”. Essentially because as he reasons, for good or for bad, ... English has become a world language in both senses of the term, international and global: international, as a medium of literary and other forms of cultural life in (mainly) countries of the former British Empire; global, as the cogenitor of the new technological age, the age of information (Kings, 2020:9).

While there might be aversions for the domineering role of English globally, the reality is that “English is too deeply entrenched, and if people are deprived of the chance of learning it they are the ones who suffer” and ironically “if you want to resist the exploitative power of English, you have to use English to do it” (Kings, 2020:7). That is the situation of some African writers and thinkers like Ngũgĩ wa Thiong’o who eloquently writes about decolonizing the African mind and African literacy education using English to do so regrettably. It is the same scenario with an African professor of Yoruba language for instance writing and delivery his or her inaugural lecture in English not in Yoruba, the language of the profession. To sum up the sentiments of English as both a global and international language, and the language one can hardly do without, Kachru (2020: 447) evokes the metaphor of English as “the Speaking Tree”, which “represents both fear and celebration, aversion and esteem, and, indeed, agony and ecstasy” rolled into one.

The re-rooting of English is a subject of many English discourses. For instance, Kachru’s concentric and overlapping circles of inner, outer and expanding circles categorization (Kachru, 1985, 1997). There is Graddol’s (1997) classification of (native) speakers, English as Second Language (ESL) speakers and English as a Foreign Language (EFL) speakers. There are also Yoneoka’s (2001) English Umbrella Tree and the revised English Umbrella Tree of Wenfang (2011) including the Dynamic Model espoused by Schneider (2003). What these models and paradigms point at is the spread of English globally and the conditions which favor and facilitate the spread of English and its domestication in the course of its transportation. In particular Schneider’s Dynamic Model shows how identity, contact and accommodation account for the conditions for the easy spread and domestication of English on the one hand and the emergence of “new Englishes” within the context of “World Englishes” on the other.

Englishization as domestication, hybridization and Anglicization

Following the transportation of English across oceans and continents, English found itself in the hands of new owners and as it is with languages in contact, a new English is and was bound to emerge. This is the basis for the birth of “Englishes” and “New Englishes” and the popularization of a new subdiscipline of English studies and scholarship known as “World Englishes”. Discourses on world Englishes have developed frameworks, paradigms and models to describe new Englishes dating back to the early 1980s (Strang, 1977) and more recently to Braj B. Kachru with the publication of the article on the Indianization of English (Kachru, 1983).

One of Africa’s finest writers, Chinua Achebe makes the point that while writing in English is inevitable, that English must be a “new English” able to express and carry the burden of his peculiar African experiences but still in full communion with international intelligibility. This is the English we find in use in his novels. This kind of claim is echoed by Germino Abad, the Philippine poet in another way when he declared, “English is now ours; we have colonized it” (Egbe, 2019:12). This sense of colonialization of English is important in understanding the domestication and hybridization of English within Kachru’s “outer” and “expanding”

circles whose population (over a billion) actually outstrips the “inner” circle population (over three hundred million) who are regarded as “native” speakers of English.

To account for membership of those who have domesticated and hybridized English, Platt et al. (1984) as well as Wenfang (2011) identify the following four features:

- (i) The English is developed through the education system. This may not necessarily be so because in some Nigerian families, English is acquired as a home language not a language learned or encountered in the formal school setting.
- (ii) The English is developed where majority of the people do not speak a native variety of English. This point is taken but raises the question of who is a “native” speaker of English or who qualifies to be called a “native speaker”.
- (iii) English is used for a range of functions by those who speak and write it.
- (iv) The English is localized and nativized.

It is the feature of localization and nativization (in terms of indigenizing) that we find the domestication and hybridization of English in Nigeria beyond the obvious differences in phonology, syntax, vocabulary, semantic, discourse and pragmatic resources from other varieties of world Englishes.

Anglicization of names

Whether as personal names, place names or product names, there is a growing tendency to Englishize everything. Although this tendency started with missionary activities in the early 20th century in Nigeria, to the present, some Nigerians still opt to give English names to their children; sometimes children opt for the Americanized versions and fancy coinages such as “Dooshima” shortened to “Dosh”, “Torkwase” shortened to “Tk”, “Iveren” shortened to “Iv”, and “Ter” which is a prefix to many names shortened to “Terry” or “Teddy” as found in Tiv language spoken in North Central Nigeria. You find some Nigerians prefer to bear such names as “Blessing”, “Faith”, “Gift”, “Glory”, “Goodness”, “Grace”, “Joy”, “Love”, “Mercy”, “Miracle”, “Peace”, and the like whereas there are local or indigenous rendering of such names. This is different from the Anglicization of African personal, object and place names such as “Bassey” for “Awase” or “Obasse”, “Ekureku” for “Ekwelekwu” as spoken in Leggbo, a language spoken in Cross River State, Nigeria. Even in the name of places, products and advertisement, one sees that the general linguistic landscape of Nigeria, is replete with Englishization mostly and other times the localization of English. In Cross River State, Nigeria for instance, the government has created some new economic destinations and established some new economic ventures. For example, “Cally Air” (for a new airline in the state) and “Calavegas” (a new economic and entertainment city near Calabar, the capital of Cross River State). One can understand the logic behind the coinages with no reference to any indigenous icons or symbols.

Englishization of indigenous languages and indigenization of English

Englishization is at work when we look at the orthographies of African languages. What we see generally are local languages wrapped in English through the use of Roman script. Some languages have extended Englishization to creating standardized structures to resemble English utterances. For example, in Igbo, a language spoken in South East Nigeria, “good morning” is rendered as “*utuṭu ọma*” instead of “*! bọla chi*” or “*! teala*” or “*! saala chi*” which translates to “have you woken up”. In a good number of cases there is a preponderant use of code switching and mixing of English and local languages in the speech of many educated Nigerians whether in conversations or even formal religious discourses. There are instances of English words taking into local languages which one might regard as the indigenization of English. For instance, we have “*tabul*” for “table”, “*mato*” for “motor”, “*beredi*” for “bread” among the Tivs in Nigeria which arguably represent an instance of the Tivinization of English. This feature is quite common in many other Nigerian languages.

Educational policies and English in Nigeria: some historical backdrop

Historically, the first formal pronouncement on education in Nigeria dates back to the Education Ordinance of 1882 promulgated for the British West African territories of Nigeria and Gold Coast (present day Ghana). The Ordinance was to regulate school’s curriculum and conditions under which schools were to obtain grants from the colonial government. In that Ordinance, the teaching of English was made compulsory. That means, if English were not taught, such a school was not qualified for any grants. The status which was given to English as a compulsory school subject has remained from 1882 to 2022, some 140 years later. The status and the role of English has not been reversed nor has it diminished in the educational sector. Yet, there have been over ten different education ordinances, codes, acts and edits (Wey-Amaewhule, 2018) in Nigeria. This is in addition to the revision of several versions of the National Policy on Education (NPE) first published in 1977 with its sixth edition published in 2013.

What has remained constant is the place of English in Nigeria’s educational policy and planning and the inconsistencies with regards to the language provisions in the various editions of the NPE (Bamgbose, 2020; Egbe and Ayeni, 2018; Trudell, 2018). In fact, Trudell (2018) compared the provisions of two versions of the NPE (2004 and 2013) and highlighted the inconsistencies as shown in the Table 1 below.

A closer look at the two versions of the NPE will reveal some of the following. The 2013 version admits the concerns raised by those who question the undue reference to the three “major” Nigerian languages which tend to diminish the so called “minority” Nigerian languages. There is also no reference to a major language. Perhaps, any Nigerian language will suffice which gives room for linguistic egalitarianism and the right of language. While the 2013 version rightly says Nigerian languages will be taught not learned, there are no clear provisions on how government will ensure that the mother tongue or the language of the immediate community

Table 1 NPE 2004 and 2013 compared.

NPE 2004	NPE 2013
Section 1.10: Every child is required to learn “one of the three Nigerian languages: Hausa, Igbo and Yoruba”	Section 1.10 has been deleted.
Section 5.24 and 5.25: “One major Nigerian language” listed as a core subject for junior and senior secondary school	No reference to Hausa, Igbo, Yoruba or “major Nigerian languages” is made in the document. <i>Taliced mine.</i> Junior and secondary school subject lists include “one Nigerian language”
Section 1.10: “Every child shall learn the language of the immediate environment”	Section 1.8: “Every child shall be taught in the mother tongue or the language of the immediate community for the first four years of basic education” (including pre-primary and P1-P3)
Section 2.14: Pre-primary education is to be carried out in the mother tongue or “the language of the immediate community”	Section 2.16: For early childhood care development and education, “Government will ensure that the medium of instruction is principally the mother tongue or the language of the immediate community”.
Section 4.19: “The medium of instruction in the primary school shall be the language of the environment for the first three years. During this period, English shall be taught as a subject”	Section 2.20: “The medium of instruction in the primary school shall be the language of the environment for the first three years in monolingual communities. During this period, English shall be taught as a subject”.
From P4 to P6, “language of the immediate environment” is a subject (as is French), with English as medium of instruction	Arabic added to subject languages in P4-P6.
Section 5.24: As a core subject in JSS, “the language of the environment shall be taught as L1 where it has orthography and literature. Where it does not have, it shall be taught with emphasis on oracy as L2”. French is also a core subject; Arabic is an elective.	Section 2.23: Junior secondary education curriculum subject list includes “one Nigerian language”. French and Arabic are optional.
Section 5.25: Senior secondary school non-vocational elective includes “any Nigerian language that has orthography and literature, etc.” French and Arabic are also elective subjects	Section 3.38: Senior secondary education curriculum includes an optional subject of “any Nigerian language that has curriculum”. French and Arabic are also elective subjects.

Source: Adapted from Language and Education in Nigeria (Trudell, 2018).

will be the principal medium of instruction. It is striking that the 2013 version alludes to monolingual communities. This is a far cry in Nigeria except in some rural and hard to reach communities. As if Nigeria is not already plagued with linguistic plurality, the 2013 version makes provision for more foreign languages (French and Arabic). This simply compounds the language in education situation in Nigeria. In fact, some states in Nigeria have added Chinese to the linguistic mix.

English in the language policy provisions

Apart from the inconsistencies highlighted above, what is clear is the status of English. The reality therefore is that English appears central in discourses on language policy globally (Pennycook, 1994; Spolsky, 2004; Sonntag, 2000; Ricento, 2000). This is because the logic of postcolonial policy is maintenance rather than change. While post-independence governments appear to be making language policies, most of the time, they are only perpetuating colonial language policy. This inheritance situation has meant a futile struggle between change and continuity, with the latter usually gaining the upper hand. In practically all African countries colonized by Britain, English remains an official or co-official language. Attempts to promote the use of any other language as national or official have resulted either in failure or limited success (Bamgbose, 2020:662). The case of South Africa where nine African languages are recognized as co-official languages with English and Afrikaans in the country’s Constitution may be an exception.

Even in countries where it seems the national language issue has been resolved, English has appeared inevitable. In Rwanda for instance, there are four official languages with Kinyarwanda as the national language spoken by 99.4% of the population. Yet in 2008, English was appointed a co-official language as the language of administration as well as the medium of instruction throughout the educational system from grade 1. The legitimization of English is positioned as “an inevitable, pragmatic and rational measure for economic development” (Rosendal and Ngabonziza, 2022:1). So the choice of English does not appear as free choice but a constrained choice which undermines the inclusiveness and equity conditions that should inform language policy and planning in its broad sense. It is easy to see why the spread of English is often viewed as “natural, neutral and beneficial” (Pennycook, 1994:9) a claim that is increasingly being disputed (Phillipson, 1992; Skuttnabb-Kangas, 2000; Tollefson, 2000).

Within the Nigerian context however, Bamgbose (2020) identifies prestige, status, and functionality as critical factors which favor English in the language policy discourse. Nevertheless, Bamgbose (2020) posits that further issues abound with regard to the role of English thus:

... what role English has as an official language, whether any other language can share this role at the national level, what further allocation of functions (particularly in education), when English should be introduced in schools, and what models of English should be aimed at in English language teaching (p. 660).

In the contexts of Outer Circle countries, where English is largely acquired through formal education such as Nigeria, the detrimental effects of the hegemony of English can be seen in social stratification, exclusion, and problems associated with education and literacy, the status of languages other than English, and language rights (Bamgbose, 2020:664). Fortunately, or unfortunately, Fishman (1996: 639) is of the view that “the socioeconomic factors that are behind the spread of English are now indigenous in most countries of the world and part and parcel of daily life and social stratification.” The issues this situation throw up will be addressed in the next subsections.

English, language of education and literacy issues

With regard to the use of English as the medium of instruction and as a preeminent school subject, Tollefson (2000: 14–15) describes the situation of virtually all Outer Circle countries using Philippines as a case study which is also true of Nigeria.

Access to higher education and to jobs is predicated on English proficiency. To gain admission into tertiary institutions in Nigeria, candidates are expected to write and pass a tertiary qualifying examination with English as a compulsory subject and a credit pass at the secondary school external examination.

There is a dual system of education in which children of the elite attend well-funded and well-staffed private schools, while children from poor families attend overcrowded and poorly-staffed public schools. This may not be the case for all the private schools in Nigeria. Some private schools do not have adequate staff yet parents would willingly prefer to send their children and wards to such private institutions as a social and class marker.

Although the medium of education is English in both public and private schools, the quality of instruction in the latter is superior and the products of the private schools end up with greater proficiency in English. In fact, there are some private schools that offer and opt for a completely British or American or Australian or Canadian curriculum for students in Nigeria. Besides the quality of instruction, the disruptive nature of public tertiary institutions in Nigeria due to frequent labor disputes open up the private schools, especially for higher education, to more access and quality of instruction.

The differential in English proficiency means a better chance of the elite getting more lucrative jobs and thus being able to send their children to private schools even when the private schools charge higher tuition.

Tollefson (2000) further argues that since the policy makers are drawn from the ranks of the elite, self-reinforcing and self-perpetuation of the social class (Dua, 1996; Rubagumya, 1991) appear as the guiding principles in the enactment of educational policies in favor of English in order to secure privileged positions and “an overwhelming advantage in terms of access to jobs, social status, and power” (Tollefson, 2000:15).

One of the challenges arising from the dominance of English as the medium of instruction and as a school subject is the increasing concern for educational failure and the role of English in Nigeria’s language policy and planning. In the Nigerian school system, for instance, in spite of the duration in which English has been in Nigeria, Bamgbose (2020) observes the following problems: teachers who are expected to teach English are themselves poor models of English language teaching; children are made to learn through English medium from the fourth year of primary education when their English proficiency is still low; concern for dropout rates which range from 37.4 percent to 52.7 percent at primary school level; lack of readiness for English language tasks which are expected at the beginning of secondary education. Others are: carryover of poor performance in English to end-of-secondary-school examination, which is marked by high failure rates of over 66 percent in English and between 56 percent and 73 percent in other subjects; mass failure in University Matriculation Examination compulsory English paper, as well as in other subjects; and poor standard of English among university undergraduates necessitating the requirement of a compulsory use of English course in tertiary institutions (Bamgbose, 2020:668).

Literacy education in Nigeria: prospects and hopes for Nigeria

Although it is obvious that no matter how desirable language policies may be, if the will to implement them are not strong and strategic, the impact of such policies will remain skeletal. The situation in Nigeria is that while the policy is being formulated, there is no effort to articulate the implementation mechanisms at any level. Sadly, it is at the point of implementation, especially with the language provisions, that we realize that we are engaged in an impossible mission and what teachers then do is to resort to the “go-for-English” solution (starting with English even when learners have no appropriate proficiency in English to learn in English). So, while the problems identified by Bamgbose (2020) are realities, and since the use of English as the medium of instruction in most schools in Nigeria is non negotiable at the moment, those problems have been attributed to English literacy failure (Egbe, 2021). That is, the inability of the students to meet the language and literacy demands the content areas make on them. This is not essentially the fault of the students but rather the students not being equipped with the content area literacy needs through systematic instruction. The solutions lie in formulating and implementing a workable language of education and literacy policy, producing and accessing adequate literacy materials, adopting innovative instructional strategies, and deploying digital literacy technologies and approaches across the various educational levels in Nigeria.

Formulating and implementing a workable language of education and literacy policy

There is no gainsaying that Nigeria is still struggling with formulating a coherent and implementable language policy. There is no literacy policy at the moment. I have pointed out the inconsistencies in the language provisions in the NPE and the difficulty of implementing the language stipulations in the 1999 Constitution of the Federal Government of Nigeria. In that document, English is the official language for the business of the national assembly and provides that Hausa, Igbo and Yoruba will be used after adequate arrangements have been made. Of course, no “adequate arrangements” have been made and may not likely to be made in the near future. This is understandable because of the seeming volatility that accompanies the discourse of national language(s) in Nigeria. English is still an integrating language. Even where some state houses of assembly are in what may be regarded as reasonably linguistically homogeneous, none of the indigenous languages have been adopted in the business of the house or in governance. Besides the provisions in the Constitution of Nigeria and the National Policy on Education (NPE), Nigeria needs a national language policy complimented with a comprehensive literacy policy. Such a policy must fundamentally pay attention to the multicultural and multilingual complexity of Nigeria and root for local, regional or state languages at appropriate domains and levels of use. In doing so, the enormity of developing such local languages (in terms of human and financial resources) cannot be glossed over. Whatever local languages adopted will complement English not the other way round because Nigeria cannot afford to do away with English as a national language no matter the volume of patriotic and nationalistic inclination voiced. English is a strong hope for Nigeria.

Producing and accessing adequate literacy materials

One of the failures of the current language provisions in the NPE is the dearth of literacy materials for educational purposes in both the local languages and English but more on the former. How are children supposed to be taught in their mother tongue or language of the immediate community when some of those languages have no orthography and where one exists, there is paucity of educational and literacy materials to assist and support teaching and learning. The huge financial and personnel cost required to provide for the numerous local languages defeats such a proposal and instead favors the continuous use of English. There are situations where children in over crowded classrooms cluster around the few reading and workbooks in English available in the classroom. How much children can learn in such a class setting is better imagined! Therefore, providing adequate literacy materials in English and making such materials easily accessible make more economic, educational and pragmatic sense to reduce the number of educational failure across Nigeria’s educational levels.

Adopting innovative instructional strategies

Educational failure in Nigeria is not just about the language of instruction which is English. Research and field observations have shown that some teachers are still depending on instructional strategies of the pre-independence era such as teaching reading by asking students to read a passage and answer the questions which follow when the students don’t know how to read. This shows that there is no distinction between learning to read and reading to learn. Also of great concern is the fact that most Nigerian primary schools are yet to include reading as a school subject and when reading is taught, the approach to reading instruction is a far cry from what contemporary reading research and instruction advocate. This is also manifest in the teaching of language whether English or any other language for that matter. So, to navigate the English medium instruction, the need to emphasize innovative instruction is important for desirable educational outcomes in Nigeria. There is great hope with the support of local and international development agencies working hard to boost the capacity of teachers especially at the basic education level in Nigeria through capacity building programmes both in some local languages and in English.

Deploying digital literacy technologies and approaches

As a corollary, to adopting innovative instructional strategies, is the compelling need to harness the resources of digital technologies and affordances across all educational levels. This is an issue which a national literacy policy will incorporate when such a policy is formulated. The astronomical transformation of how people learn and live in the 21st century through digital technologies has tremendous impact on educational delivery. How to use the knowledge and competencies of digital literacy as social practice within the context of the 4Cs of creativity, critical thinking, communication, and collaboration are essential ingredients of a digitally literate citizen. It goes without saying that as global citizens, who must remain relevant and competitive, any educational system which ignores the deployment and utilization of digital technologies in its educational and literacy development and promotion, does so at a very high and regrettable cost. Luckily, Nigeria has a vibrant information technology agency and policy which are positioned to transform Nigeria’s ICT landscape if adequately harnessed.

Conclusion

I have explored the concept of Englishization as spread and domestication, the influence of Englishization in the linguistic landscape of Nigeria as well as the critical issues of English as the language of instruction in the Nigerian educational context. I have also acknowledged the literacy concerns of Englishization in Nigeria and canvassed for the formulation of a language and literacy policy for Nigeria which pays homage to the multilingual and cultural plurality of Nigeria without undermining the place of English in Nigeria. There is hope for Nigeria if we fashion out an egalitarian language and literacy policy which accords the right to language and language rights to citizens in addition to promoting innovative instructional strategies, providing adequate literacy materials

and deploying digital technologies to maximize educational outcomes in line with 21st century global demands. While researchers in world Englishes cannot turn a blind eye to the problems of educational failure or unfavorable language policy outcomes, which sometimes is placed on the door steps of Englishization, English remains one major, global and powerful resource in the world today (Bamgbose, 2020) and the place of such a language, especially in a multilingual and multicultural context like Nigeria will be hard to replace for a long time to come.

Introduction

21st century higher education is a treacherous endeavor. It is a dangerous tool of settler-colonial hegemony but can also create opportunity for emancipatory action for Indigenous and marginalized peoples (Tuhiwai-Smith, 2021: p. 38). Settler-colonial higher education is represented in the status quo or mainstream policies and pedagogies of contemporary Western academic institutions. Emancipatory pedagogies exist in the margins of the academy where Indigenous and liberation scholarship commonly reside. Indigenous scholars in particular face a sophisticated array of neoliberal and neocolonial policies that appropriate their ways of knowing and undermine the value of traditional and cultural knowledge with tokenism and a dollar. This chapter challenges the prevailing status quo of the Western academy through the application of Indigenous theory and praxis. Each section of this chapter will address salient issues concerning the neoliberal and neocolonial university system, the growing settler-colonial phenomenon of "Indigenizing the university," and the Indigenous theory and praxis that serve as pedagogies for liberation. Each salient point (Brayboy, 2005, p. 427) will provide space to introduce a developing Indigenous pedagogy called Aloha 'Āina Theory and Guerrilla Praxis as a counter hegemonic challenge to mainstream higher education.

However, before addressing the Indigenous theory and praxis of this chapter, several important foundational ideas that guide this research must be mentioned. First, this chapter is framed in the scholarly space of Indigenous knowledge and liberation studies. Those familiar with this academic area often apply anticolonial, postcolonial, settlercolonialism, critical race or Indigenous theory, and liberation methodologies as part of the analysis. I do the same here with one critical exception. That is, Hawaiians—the native or aboriginal people of the Hawaiian archipelago who are born from a genealogical relationship to the lands and gods—are not Indigenous like the native scholars of the US, Canada, or Oceania referenced in this chapter.

Sai (2008) rightly argues that in the context of international law Hawaiians are not Indigenous to the United States. Instead, he establishes a powerful historical and legal analysis that the Hawaiian nation state is occupied, not colonized. As a result, "the history of the Hawaiian Kingdom has fallen victim to the misuse of this term [colonization and indigeneity] by contemporary scholars" (2008: 111, bracket added). Sai also cautions that "when Hawaiian scholars and sovereignty activists, in particular, consistently employ the terms and theories associated with colonization and indigeneity, they are reinforcing the very control they seek to oppose" (2008: 113, brackets added). Young (2006) tempers Sai's rigid application of international law by asserting that "There is no inherent conflict between an identity that is Indigenous before 1795 or after 1843 [the year the Kingdom became a recognized nation state] ... it merely presumes a parallel coexistence with what is aboriginal from 1843 to this very second" (2006: 5, brackets added). Young's analysis suggests that even in an occupied state, Hawaiian aboriginal people's social and political experiences reflect those of other Indigenous peoples because of the "colonial-like" pattern of oppression imposed by the United States. Thus, I assert that Indigenous political and scholarly analysis can be applied here without spoiling the arguments made by Sai.

Second, the Aloha 'Āina Theory and Guerrilla Praxis analyzed in this chapter is under a state of continued development. Readers must keep that in mind as several aspects of the theory and praxis may require adjustment to maintain an effective and active resistance to the sophisticated hegemonic policy approaches utilized by mainstream academia.

Third, reference to “radical,” “activist,” “liberation,” and “sovereignty” are purposefully confrontational. From the perspective of academics like myself, promoting the status quo furthers the marginalization of natives and serves no purpose here. Thus, a more pro-activist voice is applied throughout. E mau.

Higher education, neoliberalism, and indigenous knowledge

The truth about contemporary Western higher education in the 21st century is that it reinforces the status quo at the expense of meaningful transformative change. For Indigenous peoples in the academy, status quo is revealed in a university's appropriation of native culture and identity to advance settler-colonial ideologies. In the past two decades, universities have feverishly shifted toward neoliberal economic and social policies that “protect the practices of the powerful from being publicly scrutinized as they appropriate resources to serve the interests of the few at the expense of the many” (McLaren, 2015: pp. 1–10). As such, the adoption of neoliberal policies in US educational institutions have “led to the defunding of schools and colleges” and further pushing universities to “conform to a corporate model of higher education” (Sudbury and Okazawa-Rey, 2009: p. 4). Apple (2019) succinctly outlines the hegemonic conditions of US education as a free-market labor process that encourages racial and economic domination of marginalized groups whose non-compliance is considered “somehow not fully American” thus rendering them invisible (2019: p. viii).

Smith (2004) describes the expansive reach of Western neoliberal policies on an international scale in his discussion of economic and educational reform and its impact on Māori in Aotearoa, New Zealand. G. Smith explains that a key function of the hegemonic strategy is to use white Western values and thinking “to marginalize, demean, derogate, and subjugate Māori people and their cultural preferences” (2004: p. 47). Similarly, Smith (2009) asserts that the university is an academic-industrial complex where Indigenous knowledge is treated as a commodity operating in a space that is governed by “multinational capitalism, US empire, and white supremacy” (2009: p. 40).

Indigenous educational spaces have been rendered almost negligible as a valued form of intellectual development in the context of US higher education. Trask's (1999) assessment two decades ago regarding the flagship Research 1 institution of the University of Hawai'i (UH) at Mānoa, highlights the prolonged struggle for Hawaiian academics working within the American academic-industrial complex. Trask's observation that universities function to “legitimate and entrench the power of the colonizing culture” by implementing a bureaucratic white male-dominated institution explains the structural powers driving the indigenizing university process today (1999: pp. 151–152).

Indigenizing the university—the new neoliberal construct

Since the second publication of Trask's influential book, *From a Native Daughter: Colonialism and Sovereignty in Hawai'i*, there have been several attempts by university administrators to “indigenize” the university. But, very little has been done to move beyond the neatly packaged, copious sprinkling of misappropriated native words and phrases that serve phatic university goals for faux diversity and accreditation (de Leeuw et al., 2013: p. 382). University efforts to appropriate Indigenous terminology for insincere claims of equality and inclusion only cheapens complex Indigenous ideas and covers up the dominant group's preservation of power (Apple, 2019: p. 166).

The process of indigenizing universities is common among many contemporary academic institutions. And while there are newly developed policies that acknowledge Indigenous lands and peoples, those seemingly well-intended policies have failed in creating meaningful transformative changes to the institution (Brayboy et al., 2015; de Leeuw et al., 2013; St. James, 2022; Stewart-Ambo and Yang, 2021). In fact, many Indigenous and non-Indigenous scholars have effectively argued that the “indigenizing the university” process supports neoliberal and neocolonial ideologies instead (Hill, 2012; de Leeuw et al., 2013; Gorrie et al., 2017; Antoine, 2017).

One way to understand the faulty logic behind an indigenizing university policy is to consider a system that has been designed by Indigenous scholars to address settler-colonial assimilationism and domination (Stein, 2003). American Indian Tribal Colleges (Tribal Colleges) developed as a response to the failures of the US higher education systems to assist the intellectual and cultural needs for native self-determination and sovereignty among other things (Benham and Stein, 2003; Shanley, 2003). According to Stein, the guiding principle for the development of Tribal Colleges was that “American Indian people must control the university” and that such a principle “is very much at the center of all successful movements of Indigenous, poor, or minority people” (Stein, 2003: p. 31). Stein argues that the rights and privilege to define and determine Indigenous education is a sovereign prerogative that resides with the Indigenous communities, not outsiders. Outsiders, like university administrations, set false presuppositions and goals that distract from native empowerment (2003: p. 31).

While the Tribal College systems are not without struggle and issues of settler-colonial influences (Shanley, 2003), the point here is to highlight the obvious limitations (and flaws) related to the academy's indigenizing policies. To state the obvious, Indigenous peoples create Indigenous knowledge and have the authority to decide (right or wrong) how to apply that knowledge. Contemporary universities may claim to have programs that support Indigenous initiatives, but unlike Tribal Colleges, Indigenous communities clearly do not control the power, direction, pedagogy, and delivery of knowledge in those systems (Brayboy et al., 2015). Instead, universities are executing nominal representation and ambiguous value systems in the name of indigenizing the universities.

Antoine (2017) asserts that contemporary universities are appropriating Indigenous knowledge to reinforce negative political tropes that tokenizes the native. Accordingly, native communities and knowledge are exploited and treated as window dressing (2017: p. 117). Indigenizing the university is an approach that may produce glossy marketing highlights to placate the well-intended administrator while simultaneously reinforcing rhetorical tropes (Keawe, 2008: p. 4; de Leeuw et al., 2013: p. 389; Mihe-suah and Wilson, 2004: p. 6) that undermine Indigenous peoples' knowledge and methodologies. In fact, administrative "good intentions" are the new neoliberal or neocolonial approaches employed by contemporary universities.

Authors de Leeuw, Greenwood and Lindsay suggest, that administrative good intentions create deep colonizing consequences that reinforce historical inequities and help to distract from more meaningful ways to establish anti-colonial or Indigenous world views in the academy (2013: p. 382). The authors provide a powerful critique of the indigenizing process used by universities in Canada that apply remarkably well to other institutions in the US and Oceania. Such indigenizing policies highlight the impulse of settler-colonial administrations to re-write history in a way that distances the administrators and the colonizing nation from the oppressive legacy of colonization and occupation. As a result, institutions are manifesting "new kinds of policies and practices ostensibly aimed toward addressing and ameliorating past wrongs" which the authors argue "demand critical attention because they function to obscure ongoing harms and injustices of colonial practice, subverting the very good intentions they purport to represent" (de Leeuw et al., 2013: p. 384, 391). Hill (2012) also critiques the "indigenizing the university" approach and argues that good intentions will not properly address Indigenous issues in the academy because the academy ignores "the profoundly colonial nature" of higher education (2012: p. 3). Unless there is "an explicit goal of decolonization" embedded in the policy, engagement with Indigenous thought might strengthen processes of colonization (2012: p. 3).

Aside from the occasional scattering of a few table scraps for Indigenous faculty positions, increased Indigenous enrollment, and targeted Indigenous program funds, the benefits of an indigenizing university principally favors the university's neoliberal "banking concept" and consumer economy (Freire, 2005: p. 72). In such a process, native academic efforts aimed at improving Western universities often come with unhealthy compromises that harm Indigenous knowledge and disempowers their communities (Hill, 2012: p. 3).

The truth about the academy is that it is rife with neoliberal and neocolonial ideologies utilizing policies like "indigenizing the university" to feign equality and recognition for marginalized peoples. However kind the indigenizing policies may appear, the lack of commitment, consequential sharing of power and control, and respect for native sovereignty by the academy, furthers the erasure of Indigenous communities.

Academic gatekeeping and the pedagogy of refusal

The Western university system serves as the gatekeeper of all knowledge. The system extracts Indigenous knowledge to reinforce Western biases while allowing various non-threatening strands of Indigenous and critical pedagogies limited spaces of recognition and functionality. Goodyear-Kaōpua and Kuwada (2018) assert that US political hegemony uses "safety zones" to negotiate acceptable forms of native knowledge in a piecemeal basis so that the settler state can sanction "spaces in which some aspects of Indigenous culture can be practiced as long as they do not disrupt or threaten settler society" (2018: p. 52). Thomas (2021) describes this form of native subjugation as "extractivism." For Thomas, extractivism is "a way of understanding forms of exploitation and subjection of people in capitalist systems" (2021: p. 1). She maintains that state-led engagement strategies with Indigenous peoples are not reciprocal arrangements and only those Indigenous concepts that most aligns with Western ways are cherry-picked out of context leading to the further oppression and the undermining of Indigenous communities (2021: p. 2).

The academy's idea of inclusivity is more reflective of the neoliberal status quo and less interested in meaningful applications of Indigenous knowledge. The result is that Indigenous scholars are incentivized to suppress the conscientization and transformative needs of the community. Thomas notes that well-intentioned collaboration between universities and Indigenous scholars will extract Indigenous knowledge by replacing it with "state language, systems and processes" (2021: p. 2). Even when Indigenous grassroots organizing successfully adapts counter-hegemonic voices to Western institutional learning, Indigenous energies and political capital are overextended on neoliberal equality and fairness debates rather than aggressively critiquing and transforming the institution (Hill, 2012: p. 1). Thus, Indigenous concepts are effectively extracted by university administrations to help make the academy's hegemony appear less overt and more palatable but operational nonetheless.

The practice of using Lorde's (2012) "master's tools" has shown some strategic usefulness but has its limitations. As Lorde predicted, those uses are proving far less transformative and unrelated to more salient issues like Indigenous sovereignty. Instead, neoliberal policies are used to skillfully divide and silence critical native voices allowing university administrators to selectively partner with willing and obedient native compradors "who want reform but don't really want to upset the status quo" (Bobo et al., 2001, pp. 19–21).

Grande (2018) offers sage guidance when challenging the neoliberal and neocolonial recognition policies of the academy. She cautions that settler-colonial policies like indigenizing the university, supplants more transformative Indigenous critiques within the "political project of liberal pluralism" and the "politics of recognition" that maintain the status quo (2018: p. 56). The politics of recognition superficially acknowledges the "respect for cultural differences" while asserting settler power over Indigenous peoples and knowledge (2018: pp. 49–50). Moreover, the politics of recognition encourages Indigenous collusion and complicity with neoliberal policies that will likely derail efforts to establish meaningful transformative change. The indigenizing the university approach is essentially a prescribed settler process that drives native academics to consent to their own oppression. Grande argues that Indigenous academics must engage in a pedagogy of Indigenous refusal. Indigenous refusal adopts radical alternatives that

“rejects the false promise of inclusion” found in the academy’s settler-colonial policies and that “asserts Indigenous sovereignty and peoplehood” (2018: p. 59). Indigenous refusal is an overt sovereign act that clarifies the positionality of the native with the neocolonial policies of the academy, and that encourages pedagogies that are culturally grounded, sovereignty based, and guerrilla in praxis.

Indigenizing the university of Hawai'i

Settler-colonialism has morphed in institutions across the US, Canada, and Oceania into more sinister and complex forms of oppression. Strategic planning at my institution, the UH, is an example of how the university employs neoliberal educational policies. Though this example appears space specific, native communities will find the UH policies strikingly similar to the negative policies being implemented in their own institutions.

The University of Hawai'i administration recently appropriated the traditional and cultural Hawaiian concept of “aloha 'āina,” falsely branding and redefining it with the UH's settler-colonial voice (University of Hawai'i, 2021: p. 8). The settler-colonial meaning of aloha 'āina ignores over a century of traditional stories and documented evidence on the topic including Sai-Dudoit and Tolentino's (2022) comprehensive research on the traditional, cultural, and political understanding of aloha 'āina that convincingly determined that it is, without question, a concept connected to the patriots or patriotism of the Hawaiian nation (2022: p. 27). The UH administration purposefully ignored and/or misread the available Hawaiian authoritative texts choosing instead to remake and reimagine aloha 'āina devoid of well grounded Hawaiian Indigenous knowledge.

The UH strategic plan *Manoa 2025: Our Kuleana to Hawai'i & the World, Strategic Plan 2015–2025* (“UH strategic plan” or “plan”), begins by appropriating a Hawaiian title then immediately asserting authority over Hawaiian knowledge and falsely presenting the university as the Hawaiian and worldly voice. The plan proclaims UH as a Hawaiian Place of Learning (University of Hawai'i, 2021: pp. 7–10) assigning itself the power over aloha 'āina, while ignoring the legitimate rights, duties, and claims of the Hawaiian community. The plan then fabricates a settler-colonial meaning for aloha 'āina:

Aloha 'āina is a relationship and worldview deeply rooted in Hawai'i. It is a recognition, commitment, and practice sustaining the ea—or life breath—between people and our natural environments that resulted in nearly 100 generations of sustainable care for Hawai'i. We recognize it is because of the aloha 'āina practiced by Native Hawaiians over those many centuries that we can enjoy the Hawai'i we have today. Therefore, as we continue to learn about our collective kuleana as a university truly of Hawai'i, we realize that we too have a role in aloha 'āina and we take guidance from Native Hawaiian ancestral knowledge and wisdom on this journey together (2021: p. 8).

The plan refers to Hawaiian people in the past tense, signaling that over time, UH can promote Hawaiian knowledge without including the Hawaiian community. The UH plan endorses erasure thus fulfilling Patrick Wolfe's warning that “settler-colonization is at base a winner-take-all project whose dominant feature is not exploitation but replacement” (1999: p. 163).

The UH plan also weaves in key neoliberal economic triggers for future UARC and private foundation grant funding. In particular, the phrase “sustainability” is purposely attached to aloha 'āina signaling to a specific segment of scholars and funders that Hawaiian culture and knowledge is for sale and UH is its pimp. Yet, nowhere in the authoritative Hawaiian Language dictionaries (Pukui and Elbert, 1986; Andrews, 2003) or in grounded Hawaiian epistemology is the term sustainability equal to the traditional, cultural, and political understanding of aloha 'āina. So, while aloha 'āina does have some association to cultural practices that might be considered sustainable, “sustainability,” as an ambiguous Western construct, lacks any cultural relevance (Salazar, 2014).

The most distressing part of the UH plan states “We recognize it is because of the aloha 'āina practiced by Native Hawaiians over those many centuries that we can enjoy the Hawai'i we have today” (University of Hawai'i, 2021: pp. 7–10). The statement is a blatant attack on Hawaiian knowledge that reinforces US hegemony and furthers native erasure. Indeed, claiming that Hawaiians can “enjoy the Hawai'i we have today” while US occupation maintains its assault on Hawaiian identity, culture, lands, and sovereignty is despicable. According to Wolfe, UH's plan to extract Hawaiian knowledge can never be innocent because “It is too deeply enmeshed in a historical relationship through which one's power is the other's disempowerment” and that such a process will surely support the settler-colonial goal of elimination (1999: pp. 163, 212–213). Today's settler-colonial Hawai'i maintains the Disney-like imagination where tourists and the military can frolic, exploit, and destroy native and cultural resources without accountability. Apple explains that “the ability of a group to make its knowledge into ‘knowledge for all’ is related to that group's power in the larger political and economic arena” (Apple, 2019: p. 65). Freire describes such political opera operations as indispensable and divisive mechanisms used by the oppressor to control consciousness and preserve the status quo (Freire, 2005: 139). Thus, the UH extractivist policy seems to fulfill Sai-Dudoit and Tolentino's prophetic statement that “Popular iterations [of aloha 'āina will] fall victim to the purposeful erasure of knowledge that was borne of and stewarded by Hawaiians through documentation in print, mele, and mo'olelo (stories) told over generations” (2022: p. 9, brackets added).

This example illustrates how effortless it is for universities to successfully deploy its settler-colonial power and embed fabricated cultural definitions into the mainstream, despite an abundance of contrary evidence from Indigenous academic and community scholars and primary resources. Like other so-called well-intentioned neoliberal universities, UH policies are securely anchored to US hegemony. Tuhiwai-Smith (2021) explains that no real progress has been made to decolonize the academy and even the most radical gestures of recognition “can end up as mealy mouthed, watered-down liberal devices that end up reinforcing the status quo” (2021: p. xii). UH purposely suppresses Hawaiian concerns relating to the misappropriation of culture, racist and

discriminatory policies, and desecration of the sacred cultural sites that they manage. Surely, such actions reflect “mealy mouthed” policies that reinforce the status quo.

The UH administration has followed the example of other Western higher education institutions by adhering to neoliberal and neocolonial economic and policy approaches that support the continued degradation of native knowledge. While limited improvements do occur through vigilant and purposeful struggle, they are not in and of themselves the liberation or sovereignty pedagogies that Indigenous peoples seek. The policy example here tells us that Indigenous knowledge in the academy is not an equal rights issue, it is an issue of liberation and sovereignty for the native nations and the awareness to accept nothing less (Smith, 2009: pp. 52–53).

Establishing native theory & praxis

For Indigenous peoples working within Western, neoliberal academies, advancing the wellbeing of native and marginalized communities often demands active resistance to—and refusal of—settler-colonial policies. Alfred (2004) explains that universities are “adamantly and aggressively opposed to Indigenous ways” and therefore, Indigenous academics have the responsibility “to work to defeat the operation of colonialism within the university” (2004: pp. 88–89). Similarly, author Kelly (2014) asserts that “Hawaiians can’t indigenize state institutions, but the state can certainly institutionalize Hawaiians” and cautions native academics from “academizing sovereignty” until it is “pressed like a flower between the pages of a book” written by the colonizer (2014: p. 46).

In this section, a developing pedagogy will be introduced as a response to the threat of settler-colonial policies expressed by Kelly and Alfred. It will emphasize the need for radical, activist-oriented approaches to empower the native community. Smith’s (1997) paradigm shifting research on Kaupapa Māori Theory will be a guiding methodology in the development of what I am calling “Aloha 'Āina Theory and Guerrilla Praxis.”

Application of Kaupapa Māori Theory

Kaupapa Māori Theory serves “as an intervention praxis into educational, cultural, and social crises which impacts disproportionately on large sections of the Māori population” (Smith, 1997: p. 26). Developed in large part because of the Māori cultural and political revolution of the 1980s, Graham Smith, the developer of Kaupapa Māori Theory, recounts the key to the revolution came by way of “Māori critical thinking and the realization by Māori that they could make changes themselves” (2004: p. 49). Kaupapa Māori theory functions as a “complex arrangement of conscientization, resistance and transformative praxis, which collectively seek to transform these twin crises related to education and culture” (2008: p. 27, citations omitted). The goal of Kaupapa Māori Theory is to “challenge and disrupt the commonly accepted forms of research” in order to privilege Indigenous ways of knowing and being (Mahuika, 2008: p. 4).

There are three major assumptions influencing Kaupapa Māori Theory. First, that Western institutions are culturally antagonistic to Māori/Indigenous peoples which entails greater pressure toward assimilation and thus conformity to settler-colonial ideologies. Second, that Western institutions are inherently biased and disadvantage those who are non-conforming. And finally, Western structures must be resisted to create healthy spaces for Māori and Indigenous peoples to fulfill their cultural aspirations. Recognizing the fluidity and shifting strategies of settler-colonial domination, Smith notes the need for Kaupapa Māori Theory to be equally flexible in its resistance strategies (Smith, 2004: p. 49).

Therefore, G. Smith provides space for other Indigenous and marginalized peoples, like Hawaiians, to apply Kaupapa Māori theory at various levels of consciousness and praxis in their own institutions. He explains that Indigenous educators “must develop radical pedagogy that is informed by their cultural preferences and by their own critical circumstances” and that they “must ensure ‘buy in’ from the communities that are purported to be served” (2004: p. 51).

Kaupapa Māori Theory demands a critique of both the settler-colonial structures of education on one hand, and the engaged native scholars who obtain positions of privilege on the other. The second area of critique is crucial because it requires self-reflexivity that can provide important intelligence for improving native consciousness and action in the academy (Mahuika, 2008: pp. 6–12). Thus, for Indigenous academics, the academy becomes a “crucial site for critical intervention” that requires a commitment to creating space for “the production of diverse perspectives, new ideas and different styles of thinking and writing” that contradict the status quo (hooks, 1990: p. 6-7).

Kaupapa Māori Theory has in fact become a widely accepted and powerful tool in developing critical and liberation pedagogies for Indigenous peoples. Mahuika argues that Kaupapa Māori’s greatest potential “may lie in its ability to challenge Māori to develop a greater awareness of who we are, what it is we really want, and how we want to go about achieving that” (2008: pp. 11–12). In a similar vein, I argue that the development of an Aloha 'Āina Theory combined with a Guerrilla Praxis are critical devices for interrogation and resistance against the neoliberal educational apparatus of the academy.

The development of Aloha 'Āina as theory

19th century Hawaiian educator and revolutionary Joseph Kaho'oluhi Nāwahīokalani'ōpu'u (Nāwahī) said that aloha 'āina was “ka ume mageneti iloko o ka puuwai o ka Lahui, e kaohi ana i ka noho Kuokoa Lanakila ana o kona one hanau” (Nāwahīokalaniopu'u,

1895). Editors of the Kamehameha Schools Ka'iwakīlōumoku Hawaiian Cultural Center awkwardly translate the phrase as “the magnetic pull in the heart of the patriot which compels the sovereign existence of the land of his birth” (Ke aloha, 2021). The nationalist context of Nāwahī's writing during the early stages of US occupation in 1895 is clear and unambiguous. Nāwahī implores Hawaiian patriots to understand aloha 'āina as the connection between the land, the Hawaiian nation, and the people that are clearly not of America.

Silva (2002) analyzed 19th century Hawaiian language articles relating to Hawaiian resistance to US annexation. She says Hawaiian people “united in unprecedented numbers under the banner of “aloha 'āina”—love for the land, their nation and their people—to draw on the strength such feelings had given them collectively” (2002: p. 119). Like Nāwahī before, Silva identifies aloha 'āina as a “central ideology for our ancestors” that is “a complex concept that includes recognizing that we are an integral part of the 'āina and the 'āina is an integral part of us” (2002: p. 4). Additionally, scholars Sai-Dudoit and Tolentino (2022) produced a chronological analysis of the Hawaiian term aloha 'āina by utilizing 19th century Hawaiian language primary resources (2022: p. 6). The authors conclude their research by stating unequivocally that, “There is no question that aloha 'āina refers to patriots or patriotism as it had come to be understood by the subjects of the Hawaiian Kingdom and its leaders” (2022: p. 27).

Aloha 'āina has a theoretical foundation based on customary and traditional practices. Goodyear-Kaōpua and Kuwada (2018) describe Hawaiian futurities through the traditional senet or 'aha cord metaphor, where the 'aha cord represents powerful links to the past that speak to future possibilities for Hawaiian nation building. The authors state, “Hawaiian independent futurities assemble practices of aloha 'āina (love for the land) that assert that our ability to sustain generation after generation requires healthier relationships with our lands and waters.” The authors go on to say that “one of the most enduring strands of our 'aha is aloha 'āina” (2018: p. 53).

Other Hawaiian scholars continue to reinforce the traditional and cultural understanding of aloha 'āina. For example, Tuti Baker's (2018) research demonstrates that aloha 'āina is a “political strategy of resistance that is anchored in an individual's spiritual and kinship relationship to place” (2018: p. 55). Likewise, Salazar (2014) identifies aloha 'āina as a grounding political philosophy that fuels Hawaiian struggles for sovereignty and human rights (2014: p. 205). He then advises future advocates that aloha 'āina is a Hawaiian political practice that “does not reduce important cultural differences to an idealized multiculturalism that sustains inherited, systemic, and institutional power” (2014: p. 223).

Aloha 'āina is a powerful theoretical foundation for today's liberation and activist pedagogies. It is a form of community conscientization that demands social justice, sovereignty, and the refusal of settler-state domination. G. Smith's Kaupapa Māori Theory and the cultural ideology of aloha 'āina are combined in the development of the Aloha 'Āina Theory and Guerrilla Praxis discussed below.

Toward an Aloha 'Āina Theory & Guerrilla Praxis

Aloha 'āina is a cultural concept that ties consciousness and praxis to Indigenous liberation and sovereignty. This section will cover several grounded assumptions of the theory. Then, four guiding principles of Aloha 'Āina Theory and Guerrilla Praxis will be introduced. To begin, I review the totality of George Helm's January 27, 1977, conscientized and transformative letter protesting the US military bombing of Kaho'olawe island (Ritte and Sawyer, 1978: p. 27; Helm, 1984; personal communication, 1977). The aloha 'āina protests over Kaho'olawe lasted more than 20 years resulting in an end to the bombing, a partial restoration of the island, and legislation requiring the island's return to the sovereign Hawaiian government (HI Rev Stat §6K). The letter is formatted in Table 1 for analytical purposes.

Helm's letter is a commanding narrative of emancipation, resistance, and refusal that recognizes the inseparable link between cultural integrity, God(s) and ancestral mana (spiritual power), and national sovereignty. These elements have guided the Hawaiian nation through 127 years of US occupation. More importantly, Helm offers an analytical framework for Aloha 'Āina Theory and Guerrilla Praxis.

The analytical framework is derived from the major sections of Helm's letter and can be summarized in five developmental parts as outlined in Table 2 below.

Aloha 'Āina Theory and Guerrilla Praxis applications

Helm's letter provides several key assumptions for Aloha 'Āina Theory and Guerrilla Praxis. Helm begins with a broad conceptual framing that shows the complexity of aloha 'āina. In Paragraph A, he says, “I have my thoughts, you have your thoughts, simple for me difficult for you. Simply ... the reason is ... I am a Hawaiian and I've inherited the soul of my kupuna.” In Paragraphs B and C, Helm invokes the genealogical relationship with the maternal god Papa, describes the Hawaiian Islands as “sacred,” and recenters the Christian concept of “church” to Hawaiian land-based religions. Thus, he is engaging deep cultural and spiritual elements in his activism.

In Paragraph A, Helm identifies the first major tenet of Aloha 'Āina Theory—his positionality and grounding in Hawaiian (Indigenous) knowledge and spirituality. Helm's tenet aligns seamlessly with Tuhiwai-Smith's assessment that native spirituality is an important space of resistance because it privileges the Indigenous scholar and serves as “one of the few parts of ourselves which

Table 1 January 27, 1977, letter by George Helm.

I have my thoughts, you have your thoughts, simple for me, difficult for you. Simple ... the reason is ... I am a Hawaiian and I've inherited the soul of my kupuna. It is my moral responsibility to attempt an ending to this desecration of our sacred aina.; Kohe Malamalama o Kanaloa, for each bomb dropped adds further injury to my already wounded soul.	
The truth is, there is man and there is environment. One does not supersede [sic] the other. The breath in man is the breath of Papa (the earth). Man is merely caretaker of the land that maintains his life, and nourishes his soul. Therefore aina is sacred. The church of life is not in a building, it is the open sky, the surrounding ocean, the beautiful soil. My duty is to protect mother earth, who gives me life. And to give thanks with humility as well as ask forgiveness for the arrogance and insensitivity of man.	
What is national defense [sic] when what is being destroyed is the very thing the military is entrusted to defend, the sacred land of (Hawaii) America. The spirit of pride is left uncultivated, without truth and without meaning for keiki o ka aina, cut off from the land as a fetus is cut off from his mother. National defense is indefensible in terms of the loss of pride for many of the citizens of Hawaii nei.	
Call me radical for I refuse to remain idle. I will not have the foreigner prostitute the soul of my being and I will not make a whore out of my soul (my culture). All the archaeological discoveries, incredibly, are not enough it seems for the federal government to respect the sacredness of history. This continued disregard of our seriousness, this refusal to give credibility to the Hawaiian culture based on aloha 'āina, forces me to protest Aloha 'Āina	
E mau ko kakou lahui, e hoomau Hooulu ka pono o ka 'āina e Hooulu Hoola ka nani o ka 'āina e Hoola E MAU KE EA O KA 'āina I KA PONO /s/George	

the West cannot decipher, cannot understand and cannot control" (2021: p. 84). Similarly, Antonia Darder (2016: p. 8) argues that spiritual resistance creates conditions that "allow us to rethink spirituality, in our quest for freedom" (2016: p. 2).

In Paragraph A, Helm underscores the diversity of ideas and ideologies necessary for resistance by stating, "I have my thoughts ... you have yours." But in Paragraphs C and D he also notes the inequity and dominance of the settler-state ideology of the West. In fact, in Paragraph B he shows the conflict between competing Indigenous and Western values of land ("āina is sacred") and explains that Western ideology is an obstacle to justice because of its "refusal to give credibility to the Hawaiian culture." Helm understood that Western knowledge had become a default approach to mainstream knowing. Apple describes this dominating process as

Table 2 Aloha 'āina analytical framework.

“modes of determination” that help to normalize hegemony by reinforcing Western norms, rules and routines in everyday life ([Apple, 2019](#): p. 65). For Helm, the best way to shine light on Western domination was through native resistance and refusal.

Helm understood that Hawaiian knowledge is peripheral in the context of US hegemony. For example, in Paragraph D he critiques the discipline of anthropology and identifies the hypocrisy of the academy when evidence-based research defers to Western settler-colonial demands. Helm established his own form of guerrilla resistance by radically and spiritually speaking truth to power. Helm's actions challenged the US military industrial complex and exposed the damage caused by US occupation but also exposed himself to retaliation. The US and state governments considered Helm a threat because of his fearless truth telling and resistance that awakened the people to their humanity and encouraged future acts of liberation ([Freire, 2005](#): p. 141).

Thus, another key understanding of Aloha 'Āina Theory is the courage to face settler-colonial retaliation, gas lighting, and hostility whenever state power is challenged. Tuhiwai-Smith describes the cruel responses commonly deployed by settler-colonial institutions arguing that decolonizing practices in the academy are extremely messy and met with violence thus resigning many Indigenous academics to mimic the corrupted ideologies they once resisted (2021: p. 288). Resistance will no doubt require courage and the willingness to remain uncompromising to activate meaningful change. Therefore, Aloha 'Āina Theory is intimately linked to, and guided by, a deep and abiding spiritual and cultural form of resistance and refusal.

The principle of sovereignty and de-occupation

At the core of Helm's letter is an underlying argument that natives must control their lands, culture, and politics. Specifically, Helm uses key phrases and terms of native sovereignty. Perhaps the clearest indication is found at Paragraph E where he quotes Alvan Issacs Sr.'s 'āina song, *E Mau ko Kakou Lahui* ([Ritte and Sawyer, 1978](#)). The verse starts with the line “E mau ko kakou lahui e ho'o-mau” and ends with “E mau ke ea o ka 'āina i ka pono.” Both phrases exalt the life of the Hawaiian nation and prays for its continued existence. Helm is asserting a position of anti-hegemony and identifying the US as a nation bent on maintaining its economic and political power over Hawaiian lands and people through the threat of violent military force and equally oppressive civil and criminal laws. In Paragraph C Helm argues “What is national defense [sic] when what is being destroyed is the very thing the military is entrusted to defend, the sacred land of (Hawaii) America.”

Helm also identifies the academy as a problematic state apparatus empowered by the US occupation to reify settler-colonial dominant ideologies including determining and redefining Hawaiian values of sacredness and culture. Linda Tuhiwai-Smith has made this point abundantly clear: “To acquiesce is to lose ourselves entirely and implicitly agree with all that has been said about us. To resist is to retrench in the margins, retrieve “what we were and remake ourselves.” The past, our stories local and global, the present, our communities, cultures, languages, and social practices—all may be spaces of marginalization, but they have also become spaces of resistance and hope” ([Tuhiwai-Smith, 2021](#): p. 4).

G. Smith notes that the principle of self-determination is essential for Indigenous academics to gain greater autonomy over key decision-making in schooling. Similarly, Helm is imploring Hawaiians (and other Indigenous and marginalized peoples) to encounter the state system to ensure the growth of more creative spaces that can reinforce native values and rights. However, Helm is also arguing that the settler-occupier's refusal to yield to Hawaiian concerns will require a more radical Indigenous

approach. Aloha 'āina demands more than seats on decision making bodies controlled by a hegemonic apparatus. Thus, one important principle of Aloha 'Āina Theory is that sovereignty and de-occupation are necessary and non-negotiable.

The principle of centering genealogy and nationality

Helm immediately centers Hawaiian knowledge and community as a core tenet. His positionality is stated directly through various cultural concepts such as, "I am a Hawaiian and I've inherited the soul of my kupuna" (Paragraph A), "the breath in man is the breath of Papa" (Paragraph B), "keiki o ka 'āina" (Paragraph C), "I will not prostitute the soul of my being and I will not make a whore out of my soul (my culture)" (Paragraph D), and "this refusal to give credibility to the Hawaiian culture based on aloha aina" (Paragraph D). Helm is clearly identifying a key principle—his genealogical relationship to the Hawaiian nation, land, gods, and people (community).

Noenoe Silva outlines a powerful methodology that ties the Hawaiian academic to their ancestors and gods. Silva's development of "mo'okū'auhau consciousness" describes an ethic and orientation to Hawaiian knowledge and world views. She critically asserts that recalling ancestral knowledge is part of a traditional and customary ethical duty to empower present and future generations (Silva, 2017: p. 7). Helm anchors his principle of aloha 'āina to ancestral knowledge ensuring that his own transformative strategies are accountable to his kupuna and the unborn generations who are yet to join the struggle.

The genealogy of Hawaiian nationalism and the Hawaiian state is a crucial tenet that identifies the unique political struggle of Hawaiians under US occupation. Sai provides a thorough examination of Hawaiian state sovereignty under international law and proves that "the Hawaiian Kingdom was not claiming to be a new State but rather exists as an independent State since the 19th century" (Sai, 2020: p. 25). He further establishes that the Hawaiian Kingdom is a government-less sovereign nation under prolonged occupation by the United States and that "in the absence of any evidence to the contrary, the United States has continuously violated Hawaiian sovereignty and its neutrality in many major conflicts to date" (Sai, 2020: p. 120).

Indigenous genealogical and national identity help native academics to establish clearer focus on the actions needed to educate, transform, resist, and refuse settler-colonial policies. Aloha 'Āina Theory creates a specific set of obligations that motivate direct action via Indigenous genealogy and sovereignty.

The principle of kuleana and moral obligations

Helm succinctly outlines the moral obligation and humanity that dictates movement, action and decision making for Aloha 'Āina Theory and Guerrilla Praxis. He asserts that wherever there is "desecration" (Paragraph A), "arrogance" (Paragraph B), hewa, or risk of life (Paragraph D), aloha 'āina imposes a duty of justice-oriented acts of resistance and refusal (Paragraphs A, B and D). In the movement to end the US military desecration of Kahoolawe island, Helm proclaimed: "it is my moral responsibility to attempt an ending to this desecration of our sacred aina, Kohe Malamalama o Kanaloa, for each bomb dropped adds further injury to an already wounded soul" (Paragraph A). Thus, a major understanding of this aloha 'āina principle is that all cultural practices, lands, people, and sovereignty are presumed sacred and therefore any act of hostility or threat against the Hawaiian culture, lands, people, and nation is a form of desecration. The duty of those engaging in Aloha 'Āina Theory requires an unflinching commitment to protecting and perpetuating the sanctity of the nation and community in total.

Kuleana or responsibility is a well-developed traditional concept. Goodyear-Ka'ōpua (2011) has articulated an approach that combines liberation pedagogy and anarcho-indigeneity with traditional and customary Hawaiian practices to support Hawaiian political movements. She describes kuleana lahui as "Indigenous concepts for thinking about and practicing collective autonomy" (2011: p. 1). Goodyear-Kaopua argues that patriotic lessons of Hawaiian activism strengthen future obligations to sovereignty and facilitates more innovative approaches that will improve Hawaiian identity and politics (2011: p. 4).

Hawaiian language scholar Warner (1999) expressed kuleana as a critical customary practice of empowerment and self-determination. His work demands that Indigenous people not compromise their sovereign responsibility for nominal improvements that do not challenge the status quo (Warner, 1999: p. 78). Kanalu Young further teaches that kuleana requires the "fortitude and resolve to do absolutely everything that is within our power and it all begins with determining for yourself the kuleana you are destined to fill on behalf of your country" (2006: p. 7).

The practice of kuleana is not fickle and is extremely action oriented. However, it requires an understanding of the moral compass that guides the native cultural and political wellbeing. Kuleana also requires a level of truthfulness that will allow critical critiques of power and position when concerns are raised regarding duty and responsibility of natives or allies.

The Principle of truth telling, radicalism and protest (community & liberation driven)

The fourth aloha 'āina principle discussed in this chapter focuses on Helm's methodical form of truth telling expressed through a promise of radicalism and protest in defiance of state power (Paragraphs A and D). The promise of direct action comes with a humble recognition of our collective humanity (Paragraph A and B), and of the existential threat that US hegemony poses to Hawaiian culture and nationhood (Paragraph C and D). Helm points to the US's state sanctioned settler-colonial forms of violence and erasure (Paragraph A and D). Helm is posing a radical, community driven solution to help people overcome their "fear of freedom" (Freire, 2005: p. 46); a fear that has been "prescribed" over time to produce native assimilation, colonization, and prolonged settler-state occupation. Helm's truth telling is grounded in cultural knowledge and expressed powerfully in Paragraph D: "Call me radical for I refuse to remain idle. The spirit of pride is left uncultivated, without truth and without meaning for keiki

o ka 'āina, cut off from the land as a fetus is cut off from its mother ... This continued disregard of our seriousness, this refusal to give credibility to the Hawaiian culture based on aloha 'āina, forces me to protest."

Freire notes that the oppressed have the kuleana to liberate themselves and their oppressor as well. Helms truth telling and refusal effectively reached state and federal decision makers and led to emancipatory action that ended the bombing. Helm appeals to the occupier's humanity but does so with a biting rendition of the truth. For the Kahoolawe movement, the truth telling, unrelenting radical protest and activism, and appeals to human rights, weakened the militaristic, violent position of the state apparatus over time. The presidential executive order that enabled the seizure and bombing of Kahoolawe was rescinded and the island was returned to the state in trust for a Hawaiian nation (HI Rev Stat §6K). Aloha 'āina activists who fought for Kaho'olawe, understood that their radical truth telling had very real human costs. Yet they willingly sacrificed their lives and livelihoods in pursuit of aloha 'āina led justice.

Activist scholarship and liberation pedagogies in Hawai'i grew because of the Kahoolawe issue and other Hawaiian movement actions that occurred over the years. Valuable lessons were learned on both sides. As Smith (1997, 2004) warns, the liberation work of today must adapt to the clever shift in hegemonic formations of oppression to ensure a lasting presence of native resistance and refusal. And, in that adjustment, Aloha 'Āina Theory and Guerrilla Praxis implores the activist scholar to reach for tools that challenge, rather than compromise, the settler-colonial educational systems.

Freire describes emancipatory actions through the analogy of "working" human hands that can transform the world. His analogy also denounces the dehumanizing "supplicating" hands that lead to further domination (2005: p. 45). Summer Maunakea (2019) explains how her kupuna Katherine Maunakea's "ne huli ka lima i lalo" Hawaiian culture lessons influence 'āina based pedagogies that lead to greater consciousness and transformative actions in the Hawaiian community (2019: p. 9). Maunakea notes that "When your hands are turned up you have an empty stomach, when your hands are turned down you have a full stomach" which conveys the Hawaiian concept of agency and transformative change (2019: p. 12). According to Freire, transformative action must come "from the oppressed themselves and from those who are truly solidary [sic] with them" (2005: p. 45). The oppressed, says Freire, understand the necessity of liberation but he also warns that they "will not gain this liberation by chance but through the praxis of their quest for it, through their recognition of the necessity to fight for it. And this fight, because of the purpose given it by the oppressed, will constitute an act of love opposing the lovelessness which lies at the heart of the oppressors' violence" (Freire, 2005: p. 45). Like Nāwahī's 19th century statement on aloha 'āina, Freire's idea of praxis is unvarnished and confrontational. Fanon (1963), sums up the necessity of a guerrilla-oriented praxis by stating that, "whatever may be the headings used or the new formulas introduced decolonization is always a violent phenomenon" (1963: p. 35). Thus, current efforts to indigenize the university through manipulative policies, native slogans or mainstreaming definitions should be resisted and refused as strategies of domination, not pedagogies of liberation.

In Indigenous/native nations and communities, an Aloha 'Āina Theory and Guerrilla Praxis is critically needed to unravel the evolving, complex tentacles of hegemony that instigate varying degrees of fear and ambiguity among the oppressed. In many ways, an Aloha 'Āina Theory and Guerrilla Praxis creates space for humanity and love to be fully applied as a legitimate political force for conscientization and transformation (Darder, 2016: p. 6). Darder declares that "it is precisely when the spiritual solidarity of a people is asserted organically in response to collective suffering and in the name of revolutionary action ... that political grace unfolds to support acts of resistance and dissent" (2016: p. 5).

The Principle of Truth Telling, Radicalism and Protest is a pedagogical element of aloha 'āina. The theory demands direct, radical actions of resistance and love by and for the community. Helm's endearing love for his nation, people and 'āina compelled him to act decisively against US hegemony. As G. Smith notes, a transformative process is not linear but fluid, allowing for those who are conscientized, like Helm, to organize direct action while simultaneously conscientizing others by exposing them to radical protest and activism. Meaning that a truly revolutionary praxis requires "action" and "critical reflection" occurring simultaneously (Freire, 2005: p. 128). The Guerrilla Praxis of Aloha 'Āina Theory is influenced by Helm's commitment to ending desecration through radical acts of love, resistance and protest all culminating in the refusal of US occupation.

Conclusion

Academia's sanctioning of neoliberal policies to "indigenize the university" is a direct assault on Indigenous knowledge and threatens efforts for native communities to pursue emancipatory pedagogies. The academic struggles described in the UH Indigenizing policy example above is an Indigenous call to action. Neoliberal and neocolonial policies can be hidden in plain sight and will be the kind of battles Indigenous, native, and marginalized peoples will experience in the coming years as more universities push to become "indigenized" despite lacking the community authority to do so.

For Indigenous and marginalized scholars, a pedagogy of Aloha 'Āina Theory and Guerrilla Praxis may prove useful in the struggle to save Indigenous knowledge from becoming a tokenized cultural fixture in the university's hegemonic status quo. Such a pedagogy may prove effective in challenging current university policies and weaken the deployment of tokenized academics. A Guerrilla Praxis can also empower outspoken native scholars to better manage the retaliation and hostility likely to occur during the struggle. Academics and community members must therefore muster the courage to speak a radical truth anchored in mo'oku'auhau and sovereignty in the face of the academy's settler-colonial aggression.

Academics must be proactive in truth telling that will respect a university administration's humanity while publicly exposing their extraction of Indigenous knowledge. Engagement with native communities and direct action in the form of radical resistance and refusal are inseparable elements to Aloha 'Āina Theory and Guerrilla Praxis. While change is always a possibility, it does not come without struggle. Many in the academy have attempted to use settler-colonial extraction devices, like "Indigenizing the university," to claim that change is coming soon, its arrival, however, is like "Waiting for Godot" (Beckett, 1982). Therefore, incremental successes celebrated by the academy are not the functional equivalent to actual emancipatory and transformative change.

Eager to build a stronger theoretical and praxis-oriented approach to reengage the academy on native terms, this chapter recommends development of an Aloha 'Āina Theory and Guerrilla Praxis. Aloha 'āina as an ideology is already well developed and soundly established through traditional and customary practices. Aloha 'āina also has a continuity that reinforces the sovereignty and cultural integrity of Indigenous and native communities in the present century. Most importantly, aloha 'āina is and has always been influenced, motivated and driven by the sovereignty of the nation and the native community. In the academy, aloha 'āina as a pedagogy requires an approach that can only be described as guerrilla-oriented because it is expected to undergo multiple changes to meet the morphing of settler-colonialism and to avoid being absorbed into the dominant, mainstream structures of the academy. The salient facts of this chapter tell us that, until the university is truly divested of its hegemonic ideology and structure—until there is sovereignty and de-occupation for native nations—resistance to settler-state hegemony in the academy will be a constant and will therefore require a deliberate approach that is aloha 'āina in theory and guerrilla in application. As Helm has taught us, Indigenous academics must always be radical and refuse to remain idle.

Introduction

"Māori have a long history and experience of schooling in a colonial and neo-colonial era and of dealing with and responding to the hegemonic consequences of the will of the State" (Tomlins-Jahnke, 2006, p. 3). The idea that tertiary education in New Zealand is a public good has been undermined by extreme policies that treat education as a commodity and the education sector as a market. Education is about producing highly skilled, knowledgeable and useful citizens and the notion of a "profit" is in "creating educated citizens" (Tertiary Education Union, 2018). While governments have promoted tertiary education as a core public good (The Ministry of Education, 2020), it is not what these same governments have emphasized. The government ignored the fact that most Māori enter tertiary as adult students because they are more likely to leave compulsory schooling without the necessary entry qualifications for university (Schulze and Green, 2017). As predicted, Māori access and participation has declined in recent years. So on the one hand the state promotes its commitment to Māori student success (The Ministry of Education, 2013, 2020) while implementing policies guaranteed to ensure barriers to Māori access and retention (Tomlins-Jahnke and Warren, 2011). Tertiary education is touted as a public good but ironically follows the trend established in the 19th century that perpetuates systemic Māori education failure within a neo-colonial education system (Penetito, 2010; Tomlins-Jahnke and Warren, 2011; Warren, 2013).

This chapter examines the notion of public good within Māori historical experiences of colonization and their effects on indigenous institutions and social systems through perpetuating ignorance as truth, myth creation (Hetaraka, 2022; Mikaere, 2011) or as Moana Jackson refers to as "myth-takes." The chapter interrogates the way in which tertiary institutions, supported by the State, exert their power and privilege to appropriate and commodify indigenous languages, culture and knowledge. This includes the power to justify and define Māori cultural terms and concepts in te reo Māori within institutional discourses that are superficial, cosmetic and are invariably aimed at maintaining the status quo.

Just whose public good is being served?

The notion of a public good is not foreign to Māori thinking. Customary Māori societies were founded upon the principle of collective wellbeing. In the early years of the 19th century and first contact with Pākehā (European) colonizers, Māori were intent on establishing new constitutional arrangements in the form of the Declaration of Independence (1835) 5 years earlier than the signing of the Treaty of Waitangi (1840) with the British Crown. The fact that Māori were considering such arrangements "... indicates an awareness of matters of national importance, transcending individual or even regional needs, and an expression of a form of public good on a national scale" (Piripi, 2011, p. 230).

Haami Piripi argues that within Māori social organization the notion of a public good is reflected in institutions like marae and tikanga (societal systems of ethics) which existed in the Pacific for thousands of years. The concept "mahī mō te katoa" meaning "for the benefit of all," was practiced customarily, and reflected in contemporary institutions of marae and tangihanga (ceremony of mourning) and in the gifting of land for public use (Piripi, 2011). Subsequently, early Māori business practice was founded on the principle of collective benefit, especially during the 1830s when Māori were major exporters in the southern hemisphere (Warren, 2009). This sort of "communism" as a public good contributed to settler opposition of Māori communal good. The individualization of benefits, including land title, became the foundation of the settler catch cry against perceived "Māori privilege" (Meihana, 2015) while ignoring the criminal and licentious activities of their fellow settlers. The perception that Māori calls for social justice, of righting past wrongs through equitable policies and law changes in order to mitigate the devastating impacts of colonization, somehow contributes to "Māori privilege" continues to persist within the national psyche.

When we consider the oppressive colonizing of indigenous worlds, invariably the colonizer asserts the superiority of their own political and constitutional structures as universal and normal thereby disregarding and replacing indigenous structures. This sentiment was openly stated in 1862 by colonial Inspector of Native Schools Henry Taylor in his report to parliament:

Corporal punishments and an over-rigid discipline have done much to drive away many children from the schools. A punishment, which to us would appear by no means harsh, would to a Native seem cruel and excessive. As Native parents never inflict chastisement upon an offending child, our summary mode of dealing with young delinquents must seem strange and tyrannical ... In carrying on the work of civilization among the aboriginal Native race, through the medium of schools, some impediments to progress, which may be gradually overcome by a diligent course of training... and the first and most serious of all is that state of communism in which all kinds of property are held amongst them. Their present social condition bears testimony to the ill-effects of such a system. Tribal rights destroyed personal ownership... few attempts have been made by the Natives to individualise property. In the school-room, by a careful and persevering system of appropriation we may gradually train them to a proper perception of and regard for the meum and tuum ... The Native language itself is also another obstacle in the way of civilization, so long as it exists there is a barrier to the free and unrestrained intercourse ... it shuts out the less civilized portion of the population from the benefits which intercourse with the more enlightened would confer.

Taylor (1862, p. 35).

In other words, and as Jackson asserts, "... what had been forged in the specific cultural and historical contexts of England and France suddenly became so 'culture free' and 'race-less' that a colonial governor could confidently assert that the English way of doing things simply existed in an 'independently supreme' condition" (Jackson, 2018). The Latin words *muem* (what is mine) and *tuum* (what is thine) re-enforces the colonial impulse to individualize ontological perspectives. The colonial settlers, supported by escalating immigrant numbers (Warren, 2017), simply exerted their European power and privilege over a declining native population in areas where it had not existed before. The racism inherent in that privileging was a prejudice pretending to be neutral.

Thus, self-serving fabrications about indigenous peoples buttressed by embedded racism are a cornerstone of colonial oppression, expansion and settlement and which remain a "normalized" presence within the bedrock of western societies (Jackson, 2019; Mutu, 2019). Untruths perpetuated about indigenous incapacity, about indigenous peoples as uncivilized, unintelligent and of a lower order of humankind, color coded and color charted as subspecies, are evident. Early government discourse on Māori children includes statements that reflect this very sentiment about Native Schooling when School Inspector Henry Taylor informed the Settler Parliament:

I do not advocate for the Natives under present circumstances a refined education or high mental culture: it would be inconsistent if we take account of the position they are likely to hold for many years to come in the social scale, and inappropriate if we remember that they are better calculated by nature to get their living by manual than by mental labour.

Taylor (1862, p. 38).

This mindset articulated by Taylor helped set the government's socially engineered education trajectory for Māori learners based on a differential curriculum whereby Māori boys were educated in agriculture to be farmers and Māori girls trained in domestic subjects as future wives of Māori farmers. Forty years later the same differential curriculum was reinforced in Parliament in reference to Hukarere Māori girls College and Te Aute College for Māori boys:

If ... it becomes necessary to choose between a course including Latin, geometry, and algebra in the higher forms, and scientific and technical subjects, preference be given to the latter.

The Commission on the Te Aute and Wanganui School Trusts (1906, p. v.).

Since the 1800's racist ideology embedded in Māori education policy is manifest for example in the profiling of indigenous people who "look like" criminals and the low education expectations of indigenous children who are considered less competent than the children of European settlers. As Moana Jackson says of racism "[a]t its most perverse, it corrupted reason to seek proof of the inferiority—and at its most dangerous, it stripped away human dignity with no thought for the hurt that it caused" (Jackson, 2018).

Being honest about the past and the present should be the first steps to settle injustice. Ignorance is a privilege that rarely extends to indigenous peoples working in higher education. Within the academy epistemologies of ignorance are repeated whereby non-indigenous try to be honest about the dishonest injustice of a racist history. But remedying the racism that continues to sustain the privileging of colonizing power requires even more honesty, as well as a certain courage (Jackson, 2018; Shaw, 2021). Pākehā educator Anne Milne, advocates for teaching pakeha/non-Māori children about their privilege;

Not to make them feel guilt—it is to make sure they do not grow up to perpetuate the situation. Knowing that our undeserved sense of entitlement and our unacknowledged privilege impact negatively on other people, and can be changed once we understand them, is a lesson our Pākehā children have the right to learn so they can contribute to a more equitable future and do better than we have done in the past. We are selling our Pākehā children short if we don't engage them in this learning

Milne (2017).

The history of Westminster education for Māori began with several Maori youth attending Rev Henry Williams classes in New South Wales (Jarvis, 1935), but the establishment of mission schools for Maori among Northern tribes confirms the racist and

oppressive nature of the colonial education system. Mission schools were established to encourage trade, agriculture and literacy in order to benefit the settler population in of Aotearoa. However, this imposed system

... aligned with international thinking and colonial practice in the nineteenth century ... aimed to assimilate indigenous people into European society. This assimilative ideology was clearly set out in the Native Trust Ordinance 1844, which provided mission schools with financial assistance and access to Māori land. The Education Ordinance 1847 established a set of education standards in religious instruction, industrial training, and instruction in the English language

Tomlins-Jahnke and Warren (2011, p. 22).

Following the establishment of a settler government in New Zealand, legislation was passed that embedded colonial ideals aimed at subjugating native children.¹ These laws worked in conjunction with a growing European immigrant population, and a dwindling Māori population, to disempower Māori through the education system where "... schools serve to act as key agents of cultural and ideological hegemony and of selective traditions ... what counts as school knowledge, the way school knowledge is organized ... the underlying codes that structure such knowledge access to and legitimation of school knowledge is determined by the dominant culture" (Tomlins-Jahnke, 2006, p. 4). Education as a "public good" was supported by Māori who willingly donated land and financed the establishment of schools in their districts. However within a short time Māori goodwill was undermined by the machinations of colonial power. Since then, the education system has maintained its original strategy of creating a Māori labor/underclass, where early strategies in education policy was aimed at social engineering in terms of a differential curriculum for Māori (Strong, 1931). As a public good Māori education was largely focused on a "civilizing mission" premised on the idea that it was necessary to remove the Māori child from the "demoralizing influence of the Māori villages" (Barrington, 1970, p. 28) in order to quickly assimilate Māori children into European ways (Barrington and Beaglehole, 1974). The long-term impacts on the inter-generational outcomes of Māori education remain extant. As Graham Smith reminds us:

The importance of examining Māori struggle within education and schooling, is that the effects of the educational schooling crises have a correlation within the wider social, economic, political and cultural positioning of Māori in New Zealand society as a whole. In this sense there is a need to understand why Māori remain marginal despite the apparent 'neutrality' of a schooling and education system that supposedly acts in the best interests of all, despite the 'fair and just' society created by the state.

Smith (2015, p. 25).

Who gets to speak te reo Māori - the Māori language?

The use of te reo Māori (the Māori language) in education faces a similar challenge. The 19th century mission schools were conducted in te reo Māori until colonial immigration numbers and legislation impacted te reo Māori usage. Māori children who spoke Māori within school precincts faced institutionally sanctioned violence when corporal punishment was introduced (Selby, 1999). The impending demise of te reo Māori and growing objections to the suppression of te reo was brought to a head in the 1970s when a group of Māori university students called Ngā Tama Toa, who were themselves denied opportunities to learn te reo Māori, petitioned government to reintroduce te reo into schools. In Wellington, the Te Reo Māori Society based in Victoria University led a national consciousness raising exercise supported by Ngā Tama Toa. According to Te Rito these students:

were first generation city-dwellers, their parents having migrated from their rural villages to the cities after World War II, as part of the mass urbanisation of the time. For some of these migrant families, physical detachment often led to a detachment from the culture and language of their rural beginnings. Many people of this generation of Māori bore an unwarranted shame that was not of their own making – that of not knowing their own native tongue.

Te Rito (2008, p. 2).

The raising of a national awareness on the dire state of te reo Māori led to a grass roots revolution and the emergence of Te Kohanga Reo (immersion pre-school) and the kura kaupapa Māori schooling system (immersion primary schools) where te reo Māori is the language of instruction and Māori knowledge, cultural values, philosophical traditions and tribal pedagogy are central. However, Te Kohanga Reo and Kura Kaupapa Māori are more than language revitalization projects. They are community spaces that Dr. Cathy Dewes describes as sites to rejuvenate the Māori spirit (Husband, 2018), and as sites of resistance² (Rawiri Wright, 2018). Te Kohanga reo and Kura Kaupapa Māori were established in the firm belief that with their language intact children will enjoy education success and flourish (Nepe, 1991; Smith, 1997). Forty years on, the assumptions of those early leaders proved correct when students of kaupapa Māori schools began outperforming students in English medium schools in National Certificate Education Achievement (NCEA) (Warren, 2013). As grassroots movements of collective action Te Kohanga Reo and Kura Kaupapa Māori spread rapidly across the country to effect change locally, regionally, and nationally despite the government denying these schools

¹For example: 1858 Native Schools Act, 1877 Education Act, 1880 Native Schols Act, 1894 School Attendance Act.

²Rawiri Wright, personal communication, January 29, 2018.

state funding and acknowledgment (Tomlins-Jahnke and Warren, 2011). It was only after the findings of the Waitangi Tribunal Te Reo claim of 1984 was issued did the government rescind and begin funding kohanga and kura (The Waitangi Tribunal, 1986).

Following the 1972 Te Reo Māori petition, Māori language week was instituted by government and is celebrated each year. More recently the focus on Māori language has extended to include Māori musicians whose productions have helped propel te reo Māori music into the public sphere. This newfound popularity in te reo inspired music, has led to several non-Māori “newcomers” to the te reo Māori music scene, including internationally acclaimed singer Lorde, receiving rave reviews for their contributions to te reo Māori. Support from renowned Māori language and music experts such as Sir Timoti Karetu and Dame Hinewehi Mohi (Hayden, 2021) served to add credibility to the newcomers and their efforts. In fact, the profile of te reo Māori music has come a long way since Dame Hinewehi was vilified in 1998 by the New Zealand public for performing the New Zealand national anthem in te reo Māori at an All-Black rugby game at Twickenham in England. By contrast, the recent foray into te reo Māori by non-Māori musicians did not go unnoticed by Māori associated with the industry (Dell, 2021; Findlay, 2021). For decades Māori artists struggled with few resources to bring te reo Māori into the public eye, and in this moment of international recognition of non-Māori performing in te reo, has served to undermine Māori struggle and reinforce white measures of acceptability and privileged airtime.

The government’s recent focus on te reo Māori as a public good, has resulted in unprecedented levels of state funding poured into professional development for all teachers and government employees (Maxwell, 2020; Te Puni Kōkiri, 2019) in a bid to grow the number of speakers of te reo Māori. This has included developing specific Māori language programmes for teaching a predominantly non-Māori workforce with allocated resources of over \$100 million for teachers (Maxwell, 2020) and \$33 million for government workers (Forrester, 2019) including promotions and additional remuneration based on language capability. While a mere \$6 million was allocated to Te Mātāwai the te reo Māori language board for language revitalization efforts among Māori. Meanwhile the Kura Kaupapa Māori sector remains seriously under resourced at every level such as capital works, employment wages, curriculum resources, professional development to name a few. A stark example of state negligence of the sector are the many Māori children in kura kaupapa experiencing their education in leaky buildings (O’Callaghan, 2020).

While the Government’s te reo Māori strategy is aimed at increasing the number of speakers of te reo Māori among New Zealanders generally, given the level of resourcing which benefits the dominant population, the plan is likely to widen the gap between the language *haves* (increasingly non-Māori) and the *have nots* (including many Māori) under the guise of a public good. The extraordinary uptake of learning te reo Māori is contributing to the growth of te reo Māori speakers. However, the growing number of Māori on waiting lists for te reo Māori courses (Tahana, 2021) offered by wānanga Māori³ raises the question about which “public” benefits?

The situation for Māori who are non-speakers of te reo was recently brought into sharp focus on social media that highlighted the shame and language trauma experienced by many generations of Māori who do not speak te reo (The Hui, 2022). The oft-repeated phrase that Māori language acquisition is up to each individual to commit to learning or not, overlooks the colonial history of the subjugation of te reo Māori where the choice by Māori to freely speak the language was removed and sanctioned by the state’s education policy until the latter years of the 20th century. In the main non-Māori learners are privileged beneficiaries of Māori loss and deprivation. Precious Clark cautions non-Māori learning about Māori language and aspects of culture:

... step onto the bridge, but remember, it’s our backbones you are walking across. Be guided by Māori in the use of our models such as pepeha to explore your identity and develop a deep connection of respect with this land and tangata whenua. Learn te reo Māori – after all, it’s beautiful! Move into te ao marama, and once you have learnt our culture, be an ally, a champion, an ambassador of Māori – being sure to avoid ‘weaponizing’ your knowledge of Māori culture against Māori.

Clark (2020).

Herein lies the perpetual challenge for many non-Māori to relinquish the colonial propensity to dominate, to show off their newfound knowledge at every opportunity and to consider themselves an expert in all things Māori.

This extends to the popular tendency by government, institutions and the academy to appropriate Māori terms often where such names bear no relation to Māori knowledge, custom or values. For example the name “kura auraki” delineates english medium schools from kura kaupapa Māori. What is problematic about appropriation is how epistemologies of ignorance of deep cultural knowledge is manifest and revealed by shallow application. The adoption of kura auraki for english medium schools is a case in point. According to Rawiri Wright “auraki” is a sacred ancestral ocean current on which Māori navigators traversed the pacific which highlights the flagrant contradiction of such naming. It is simply inappropriate to refer to a colonial system that continues to fail and disadvantage Māori children as *sacred*. In other words, the idea that a failing colonial education system is *sacred* for Māori children denies the reality of indigenous schooling where “... the dominant cultural and power inequalities remain: the mainstream system is well-funded, and the alternative sites are relatively under-resourced and marginalized within state policy” (Smith, 2017).

³Te Wananga o Raukawa, Te Wananga o Aotearoa, and Te Wananga o Awanui-a-Rangi.

Who gets to appropriate and commodify: the case of the academy

Commodification and appropriation of indigenous knowledge and culture by the academy has become popular and common practise worldwide. Such practices in Aotearoa New Zealand are subsumed within claims of upholding Treaty of Waitangi or Te Tiriti o Waitangi “principles” with a misguided assumption that the Māori version of the Treaty of Waitangi is therefore recognized. However applying the promises embedded in Te Tiriti (the te reo Māori text) such as sovereignty over lands and resources, customs, language, and self-governance are conveniently ignored, disregarded, and overlooked. Instead, appropriating indigenous names for all manner of things – buildings, university courses, groups, committees and so on at a deeply superficial level that when combined, commodifies the language as a branding exercise. The problem is intensified through the domestication of the indigenous individual whose consent is gained in the appropriation and commodification of cultural heritage within the academy.

In the main indigenous academics belong to disempowered communities both inside and outside of the academy. For example, Whare Wānanga⁴ are institutions of higher learning in the tradition of ancient schools of learning where customary traditions, knowledge, philosophy and theory draw from Te Ao Māori, the Māori world. While Whare Wānanga are denied the right to use the descriptor “university,” the government reserved the right for western universities to use “whare wānanga” where unlike whare wānanga, the teaching of disciplines of Māori language, knowledge and culture is largely limited to Māori studies departments (Wai-tangi Tribunal, 1999). For Māori, this is ironic as Linda Tuhiwai-Smith (2012) states:

By ‘naming the world’ people name their realities. For communities there are realities which can only be found, as self-evident concepts, in the indigenous language; they can never be captured by another language.

Tuhiwai-Smith (2012, p. 159).

Universities that co-opt whare wānanga as a descriptor invariably undermine the integrity embedded in the very institution of whare wānanga. For example charging exorbitant student fees thereby contributing to Māori student debt while employees receive free Māori language tuition. Similarly, attempts to insert Treaty obligations in strategic documents is most often conditioned by the full range of human expressions of prejudice, racism and ignorance laid out in all its naked contempt when indigenous priorities are privileged (Potter and Cooper, 2016). This is a battle that many Māori academics face when advocating for strategies to advance Māori education success, while simultaneously attempting to hold ground for all Māori within the academy.

Commodification of te reo Māori and tikanga Māori (Māori ethical protocols) is apparent in university policy for example when institutions (and Ministries) define Māori concepts such as “tikanga Māori,” how it will be considered and what funding will be allocated to whom. This process is reductionist and predicates further educational failure for Māori. The cosmetic application of te reo Māori is also evident in the vast translations undertaken by tertiary institutions of webpages, staff profiles, staff job descriptions, policies, and strategies in a bid to “normalize” te reo Māori. This process often forges ahead with set targets in a bid to “tick the box” without consultation with Māori or full consideration of the broader implications of such policies. For example, one tertiary institution has over 240 policies and the first and only policy chosen for translation into te reo Māori is the student disciplinary policy. The assumption being that the only university policy te reo Māori speakers need to be aware of is the punitive policy for student misconduct, and that of all the policies it is this one which is mostly applicable to Māori, and particular te reo Māori speakers. The actions of the translator employed to translate the policy could be interpreted as having carried out lateral violence against te reo Māori students while fiscally benefitting from the action.

The academy has long appropriated Māori cultural practises of pōwhiri (welcome events), hui (meetings) and karakia (ceremonial prayer) for events such as graduations, or as token ritual practises like the opening of hui with karakia. In these moments, Māori exercise limited authority adding performative value to maintain the illusion of inclusivity for the public good. Traditionally, universities have the responsibility to be the conscience of society, and therefore a foremost focus should be on the authentic application of Māori cultural practises that is informed and respectful. This is the preferred position rather than as cosmetic illusions and/or weaponizing the language and culture for the benefit of the institution especially when it is from a position of wilful ignorance.

Who gets to speak freely

The issue of “free speech” is often employed to enable hate speech and mistruth about Māori. In recent years, this has been played out against a background of escalation of racist discourses manipulated by mainly right-wing advocates of free speech, and therefore justified as a basis for the provision of public platforms.

The denial of two Canadian white supremacists, Stefan Molyneux and Lauren Southern, to speak at a public venue in Auckland because of their extreme racist views resulted in the emergence of The Free Speech Coalition led by ex-politician and former leader of the New Zealand National Party Don Brash. The right-wing members “... are more about securing their right to reproduce hate speech against Māori and other minority groups or to defend those who do so ... than they are about ‘free speech’” (Pihamā, 2018). Central to the modus operandi of the Coalition are litigious threats of court action and defamation suits against their critics.

⁴Te Wānanga o Raukawa, Te Wānanga o Aotearoa, and Te Whare Wānanga o Awanui-a-Rangi.

Don Brash, a long-time advocate of racist views about Māori that border on hate-speech, called for publicly funded radio bosses to remove Māori language from the airwaves deeming the language “pointless” (Pihama, 2018).

Brash is also involved with the Hobsons Pledge group that mobilized a reasonably successful nation-wide tactic to veto Māori wards in city council elections which would guarantee Māori representation on local governments. The group takes its name from a statement the first Governor of New Zealand Lieutenant William Hobson is purported to have uttered. After signing the Treaty of Waitangi Hobson pledged, “he iwi tātou” meaning “we are one people” (Keenan, 2017). But for Don Brash and his supporters, one people simply means we the white people.

The venue on the premises of one university that was booked for Don Brash’s invitation to address students was canceled after someone threatened to show up with a firearm. As a result university management came in for widespread condemnation and claims, including from academics within the university, that Don Brash’s rights to Freedom of Speech were breached and, in so doing threatened Academic Freedom.⁵ Attempts to censure the Vice Chancellor were mounted against claims they had brought the university into disrepute. Management felt conflicted about Brash’s pending visit due in large part to what had transpired when the Hobson’s Pledge representatives spoke on campus and disrespected a local elder, a group of Māori faculty and students. Among issues that conflated the situation was an assertion of the denial of free speech. In fact, Brash received masses of media time and attention which subsequently led to an offer of an alternative venue in another institution where he quite freely vented his anti-Māori views. The members of Hobsons Pledge exercised their right to “free speech” while displaying overtly racist behavior. What this truth demonstrates is the power of white privilege and who gets to speak freely. There was a deafening silence emanating from some senior professors and the press when it emerged the local elder was disrespected and abused on university premises while formally welcoming Hobson’s Pledge in the Māori language. Using the notion of “free speech” as a vehicle for abuse to prevent Māori from speaking freely in the official language of our country is an aggressive and violent act of oppression.

Claims that heinous acts of terrorism visited New Zealand in Christchurch can be described as “this is not us” is simply not true. The history of colonization in New Zealand suggests otherwise, as does its enduring neo-colonial operations within the academy. As legal scholar Moana Jackson maintains, the idea that “this is not us” is about “... the telling of a past that has been misremembered, and expressions of the ‘us’ that ought to be, rather than the reality that the legacy of colonization has left” (Jackson, 2018). A reality that includes colonial military assaults on any Māori community who defended their lands and resources (O’Malley, 2019; O’Malley and Kidman, 2018). Jackson reminds us that it is important to acknowledge the past and the present because the massacres in Christchurch underpinned by ideologies of racism and white supremacy are manifestations of colonization and a

... founding presumption that the so-called white people in Europe were inherently superior to everyone else. Some of Europe’s greatest thinkers contributed to the development of this presumption, and it eventually encompassed everything from the superiority of their form of government to the greater reason of their minds and even the beauty of their bodies. They were merely warped fantasies posing as fact, but they were eventually learned as the “truths” that enabled Europeans to assert that they had the right to take over the lands, lives, and power of those they had decided were the “lesser breeds”.

Jackson (2018).

Māori intellectual thinking is not new or an outcome of colonization. Our rich traditions of research and knowledge creation has always existed long before white explorers and settlers set foot on our shores. In Aotearoa New Zealand “whare wānanga” are systems of education underpinned by ritualized and formalized forms of pedagogy that extended into all aspects of everyday life (Pihama, 2019). We agree with Leonie Pihama’s contention that ...

The active suppression of Māori knowledge in colonial legislation and through ideological warfare meant that much Māori knowledge has been actively attacked or forced “underground” (Pihama 2001). This suppression was instrumental in the development of the colonial education system that sought to take the place of Māori systems of knowledge transmission.⁶ The marginalisation of Māori knowledge and Māori pedagogy has meant that our learning and teaching processes have been denied to generations of Māori people. This has without doubt been the situation in the University system, both in academic teaching and research. Researching within institutional frameworks often means having to deal in a daily way with critical issues related to Māori research, being a Māori researcher, being a Māori academic, a Māori woman academic.

Pihama (2019, p. 64).

In conclusion, our experiences tend to mirror those of indigenous academics across the world – education, indigenous language struggles, appropriation, commodification, and free speech remain sites of significant struggle for indigenous populations. While we create and regain cultural space and autonomy it is imperative that “... at the same time we must deconstruct the colonial power structures that show no love for our language, our culture or us” (Warren, 2017, p. 361). As Moana Jackson reminds us, we understand that the very idea of racism has become an abstraction described in various ways as unconscious bias, casual racism or unintended prejudice. Such terms can have some value, but they can also excuse the perpetrator and fail to address the unarticulated

⁵<https://www.donbrash.com/elocal/free-speech-again/>.

⁶“In the Native Schooling system there was a clear intention that te reo Māori be removed as a medium of instruction and that in order to receive support for a Native School that there be a commitment made to English as the medium of instruction with te reo Māori being used purely as a means of facilitating the learning of English” (footnote in Pihama, 2019).

distress and anguish that racism causes. The challenge for the academy is how brave and honest it can be in realizing that the just exercise of power can never be based on essentially racist assumptions that are themselves unjust (Jackson, 2018).

The Treaty of Waitangi was signed in 1840 between representatives of the independent tribes of Aotearoa and the British Crown. It is the foundation upon which Crown Māori relationships were based, that gave permission for British citizens to enter and when New Zealand was established, first as a British colony and later as an independent nation. Signing the Treaty in 1840 was a response by Māori tribes to, among others, the promises that modernity, in the form of new technology, new knowledge, resources and life-style, offered. However the failure of the Crown to live up to its Treaty promises almost from the outset provides the root of racism in Aotearoa/New Zealand. Racist behavior and attitudes must be addressed as a critical foundation of “public good” for the nation - for Māori as tangata whenua (First peoples of the land), for Pākehā (settler descendants) and for all other manuhiri (visitors and residents) as tangata tiriti (settlers to New Zealand under the jurisdiction of Te Tiriti o Waitangi). As Mikaere maintains of the settler/Pākehā society,

[t]here is nowhere else in the world that one can be Pākehā. Whether the term remains forever linked to the shameful role of the oppressor or whether it can become a positive source of identity and pride is up to Pākehā themselves. All that is required from them is a leap of faith.

Mikaere (2004).

For indigenous peoples, public good often comes at a cost. It is a price we pay in the exercise of our right to exist as Māori and as citizens of Aotearoa New Zealand. We continue to speak truth to power simply because our truth matters as first peoples of the land, and in the interests of the public good.

Universities, as socially progressive as they imagine themselves, remain conservative in how they maintain systems and notions of colonialism, racial and cultural superiority, and patriarchy. The publication and take-up of the Truth and Reconciliation Commission (TRC) of Canada's Calls to Action in 2015 have led to a years-long rush among Canadian universities to demonstrate how they are contributing to reconciliation with Indigenous peoples. Claims of decolonizing and indigenizing are made yet many question whether the actions match the rhetoric (e.g., Gaudry and Lorenz, 2018). While I believe the gains for Indigenous people that can be made at most universities are modest, it remains important to attempt to transform the ways in which learning is carried out (Andreotti et al., 2015). Each small decolonizing step, each small indigenizing step, is a demonstration of Indigenous resilience.

So the question remains, can colonial institutions like universities be transformed in ways that are meaningful for Indigenous people and communities? In this entry, I will reflect on my first 5 years (2017–22) as chair of one of the only Indigenous Education departments at a university in Canada. I hope this reflection provides some inspiration for other Indigenous academics to find ways to support Indigenous aspirations and futures in their own institutions.

First, it's important to interrogate what is meant when I say decolonization, indigenization, reconciliation and resurgence. Decolonization is the divesting of colonial power from social, cultural and political institutions (Smith, 1999). While decolonization formerly referred specifically to the handover of government, it's increasingly realized that decolonization must extend beyond the political to the psychological. Indigenous individuals themselves have a decolonizing process required to divest our own internalization of colonial thinking, being and doing inculcated through education and cognitive assimilation (Battiste, 1998). Decolonizing is a process, perhaps never an arrival, and this notion has been described as a cycle involving five stages by Laenui, 2000 consisting of the recovery, mourning, dreaming, commitment and action phases. In this article, I will show how we at the Indigenous Education Department (IED) at the University of Victoria have engaged in each of these processes at various times.

Next, the word Indigenization is sometimes used uncritically (and carelessly) interchangeably with decolonization. At other times, it's critically assessed as a move that appears to be taking action while leaving current power structures comfortably unchanged or maintaining status quo. Indigenization means to make something Indigenous or to become influenced by Indigenous worldviews, perspectives and ways of doing things so as to change fundamentally. Another word that has been associated with Indigenization both in celebratory and desultory ways is infusion. To infuse a practice with Indigenization could mean that it becomes so Indigenous it's altered entirely so its entire being is transformed. This would be the ideal. But others have looked at infusion as "add and stir" approaches that don't fundamentally change the base. Like flavoring water, it's still water, but it tastes different. In my thinking, I've often assumed we can't fully Indigenize an institution until it's been decolonized first. But I also think we need to be working on both processes concurrently. If we wait for a place to decolonize we might not have the knowledge or capacity to Indigenize unless we've been working from that end too. Another way to look at this dilemma is internal and external. I feel like decolonizing work is aimed at colonial institutions and practices like the universities that are outside of our full control and our being. But Indigenization is bringing ourselves, our bodies, our practices and ways of teaching and learning into all the spaces we occupy, including universities. When we bring our knowledges with us into these spaces we are Indigenizing.

Another word that gets tied up in Canadian university policies of decolonizing and indigenizing is reconciliation. The TRC defined reconciliation as "establishing and maintaining a mutually respectful relationship between Aboriginal and non-Aboriginal peoples in Canada. For that to happen, there has to be awareness of the past, an acknowledgment of the harm that has been inflicted, atonement for the causes, and action to change behavior" (pp. 6–7). I've often made the distinction between reconciliation and resurgence as the work non-Indigenous and Indigenous people have to focus on respectively. Reconciliation is the work non-Indigenous people have to do, particularly around learning the truths, acknowledging them, atoning and taking action to change those root causes that led to assimilatory and genocidal policies. When you look at what's involved according to the TRC, that work is decolonial. Getting at the root causes and changing them is decolonizing. If this work is carried out, it

will free up space and place for resurgence activities, which is more properly the work of Indigenous people and communities. What is resurgence? Simply put it's a bringing forward from dormancy traditional Indigenous practices of relationship to land and community (Corn tassel, 2012). It's a renewal of culture through daily practice of language, prayer, ceremony, and responsibility to land and life.

One more term requires defining before we continue: Indigenous education. One useful definition (May and Aikman, 2003) focusses on the sources and approaches and how it's part of a resurgence process:

Indigenous education specifically focuses on teaching Indigenous knowledge, models, methods, and content within formal or non-formal educational systems. The growing recognition and use of Indigenous education methods can be a response to the erosion and loss of Indigenous knowledge through the processes of colonialism, globalization, and modernity.

Archibald (2020) adds, "Canadian Indigenous education includes education for Indigenous learners at all levels and ages and learning about Indigenous peoples' history, cultures/knowledges, and languages for all learners in educational systems." In IED, this dual approach of education for Indigenous learners and education about Indigenous ways for all learners is reflected in our two main areas of work: Indigenous language revitalization and teacher education for all learners.

Kirkness and Barnhardt (1991) identify the 4 Rs of Indigenous higher education as respect, relevance, reciprocity, and responsibility. As I progress through examples of the work we are doing in IED, I will demonstrate how our approaches are embedded in the 4 Rs. I hope to show that our work is, at times, decolonizing, at times focused on reconciliation, often Indigenizing and always resurgent. It is an attempt to, as Andreotti et al. (2015) have described it, hack the system, so that Indigenous communities can flourish, even if the institution's reforms are described as decolonial but are in practice far less radical.

There are a number of features to highlight in our work that I believe are worth striving toward including partnering directly with Indigenous communities, privileging community voices, centering Indigenous knowledges, revitalizing Indigenous languages, sitting in the space of dissonance, respecting the collective over the individual, reciprocity and educating for reconciliation. There are many lessons we have learned along the way and by sharing these we can help others be wary of overload and burnout, tokenization and ghettoization, funding issues, and avoiding barriers from standardization.

ĆELÁÑEN I SNEPENEK ŁTE

Respecting honoring and living Indigenous ways of knowing and being

Smith (2003) has written about the need to center our own ways of knowing, doing and being so that we, rather than the colonizers, are setting the agenda. One of the ways IED ensures we are centering Indigenous ways is by having an Advisory Board of Indigenous community members. Further, we enter into partnerships with Indigenous communities to develop programming with them in their territories. We put our peoples' writings and recordings in our courses and teach from Indigenous approaches about Indigenous topics. In our strategic plan, our very first set of goals fall under a heading called ĆELÁÑEN I SNEPENEK ŁTE, which is a SENĆOŦEN teaching meaning respecting, honoring, and living Indigenous ways of knowing and being. Our mandate in IED as it appears in our strategic plan is:

We want students to see the Department of Indigenous Education as supportive partners in life-long learning and a caring, safe Indigenous-led environment that respects, honours and lives Indigenous ways of knowing and being. We care deeply about supporting students on their learning journey and respect the protocols and practices of local Indigenous peoples.

We define success as a wholistic student experience respecting Indigenous knowledge, responsible relationships, community reciprocity and cultural relevance. Success is striving for balance among the spiritual, emotional, physical and intellectual aspects of being and participating in activities whose Indigeneity is not only valued but honoured.

In McGregor's (2014) evaluation of IED's B.Ed. in Indigenous Language Revitalization (BEDILR), she noted that the content and approach of courses created safe[r] spaces for the Indigenous students taking the program.

"The Bachelor of Education in Indigenous Language Revitalization (BEDILR) at the University of Victoria was launched in 2011 with two main goals: (1) to address the need to revitalize highly endangered Indigenous languages, and (2) to train a new generation of language speakers to teach the languages to other members of their communities. The four-year ladder program provides a foundation in Indigenous language, and skills in language revitalization strategies, and elementary school teaching" (McGregor, 2014). "Graduates from the BEDILR program are eligible to be certified teachers in the Province of BC."

Because the students enter the BEDILR from the Diploma program, there is an effort to support them in acquiring credits that may have been missed in their previous education. Indeed, one of the successes made possible by our Indigenous Language Revitalization (ILR) programming, is the acquisition of postsecondary education and credentials for students who were marginalized in their education journeys before encountering ILR at UVIC. They may have felt pushed out of western schools before, left school early for a host of reasons, or are healing from a legacy of residential school as a direct survivor or intergenerationally. A safer space for learning is created within the ILR courses where the histories are understood, and where the knowledge and approaches of Indigenous communities are respected, honored and employed in the programming. Some of the prerequisites for the BEDILR are requirements of the Ministry of Education and IED will arrange to put on courses meeting these conditions for the students that need them.

Respect for Indigenous ways and the centering of local knowledge means that students who were not given a chance to succeed in other western schooling find themselves going much further than they expected. In an evaluation of the first two BEDILR cohorts, [McGregor \(2014\)](#) found,

Both BEDILR communities cited as a central success the number of students who have graduated with diplomas and degrees. Many students succeeded in their programs despite entering the program with little formal education and with many family and community responsibilities. For example, one student began the program with a grade 5 education and graduated with a Diploma in Indigenous language revitalization. A well-known community Elder graduated with a Bachelor's degree. Many students were parents, grandparents, aunts, uncles, and important figures in their community who took lead roles in cultural events and celebrations. In different ways, all these students inspired others in their student cohort and community with their desire and motivation to learn.

More recently, a student reported

I took the language revitalization program through UVic and I didn't expect to make it this far. I come from a construction background ... I felt a big accomplishment in myself and doing my part in educating the greater community of the real history of our people and the real history of Canada really because it was all taken away from us through the residential school and day school experiences.

IED and UATÉ (2022).

Many graduates of the BEDILR have become teachers of Indigenous languages in school settings. A significant number entered immersion schools and are actively contributing to the development of curriculum and policies to ensure a new generation of speakers. Some have even become instructors for IED of the next cohort in their community.

We also chose to center Indigenous ways in our departmental governance by introducing policies for decision making and tenure and promotion policies that stem from Indigenous traditions. One of the first policies I shepherded through the newly created Department was a consensus model for decision making. IED does not use the standard Roberts rules or similar guides for running our meetings. We discuss topics or issues, often in circle and when a decision needs to be made we try to arrive at a consensus. We have never pushed an item to a vote. Consensus is different from unanimity and fortunately our department decisions have often been unanimous.

IED used to follow its former home department's tenure and promotion policy. While there were some progressive elements such as recognition of community-based research activities, there remained limits to the understanding of Indigenous scholarship, particularly around collaborativity and the difference between service and scholarship. In my first years as Chair, I sought to make the promotion and tenure review process more inclusive of Indigenous scholarship that is community-based, focused on language learning, and represents the often hidden Indigenous labor taken on to support Indigenous students and do unacknowledged Equity, Diversity and Inclusion (EDI) work. In 2019, IED moved toward its own unit standard, defining what is considered the bar for teaching research and service. It laid out clear standards for promotion to associate and full professor and tied these to a list of recognizable Indigenous scholarly activities. Included among the scholarly activities are Indigenous language learning, support and mentorship of Indigenous students, contribution to EDI efforts at the university, and a much longer list of community-based activities. This excerpt from our policy demonstrates the significance of the undertaking:

While the Department of Indigenous Education (IED) acknowledges the important role of rewarding performance in research, teaching and service, we also seek to reward performance based on the strategic goals and mission of IED: to guide transformative relationships in teaching and learning and extend a circle of welcome and support that enables Indigenous cultures and languages to flourish, while working to ensure that Indigenous ways of knowing, learning, being and doing thrive.

... Thereby, the Department of Indigenous Education recognizes that our mission is enhanced by our faculty members participating in Indigenous community and grounding their work in Indigenous ways of knowing, being and doing. By engaging and participating in Indigenous community, faculty enhance the viability, reputation, experiential opportunities, knowledge and depth of the Department's research, teaching and service.

IED continues to exist within a Eurocentric institution of learning and knowledge production. Our scholarly activities are necessarily a syncretic blend of Indigenous Knowledge ways with conventional academic approaches.

IED acknowledges that in Indigenous contexts, teaching, research and service activities can overlap and must be viewed from a more wholistic lens. This reality is addressed in Appendix B: List of accepted Research, Scholarly and Creative Activities.

Another step our department has taken to contribute to Indigenous community development is advance a complement plan for faculty and staff that prioritizes the hiring of Indigenous people. We have engaged in limited and preferential hiring practices (limited meaning only Indigenous people are considered, and preferential meaning the pool is composed of two lists, a first list of only Indigenous candidates that is reviewed first and a second list with non-Indigenous people consulted only if the first list is exhausted and no one is successful). To further support Indigenous people, our unit uses Indigenous community spaces for events like our Advisory Board meetings and planning retreats, and hires Indigenous caterers when we can. In our community partnerships we hire local First Nations coordinators, and instructors.

We try to live our Indigenous teachings as much as we can within the confines of the colonial institution we find ourselves in. When we request Elder support for events we pay an appropriate honorarium and we take care of their needs such as food, parking and travel support. We are committed to engaging in traditional protocols as much as possible. For example, when one of our beloved faculty members passed away, we organized a memorial on campus following her Kwakiutl protocols but because we were on Lekwungen and W'SÁNEĆ territory, we opened following local protocols with a practice to then welcome Kwakiutl to hold their ceremony within the house. After, the space was returned to W'SÁNEĆ so they could close in their way. When one of our students injured themselves on campus we followed ceremonial protocol. We went to the big house on their territory with their families, colleagues, instructors and IED present and held a feast and gifted her a collection to help her through the inconveniences she suffered. Another example is the moving of our Grandmother XAXE SIÁM SILA, the woven artwork depicting 13 moons. We followed protocol when she needed to be moved from one location on campus to another. Staff bathed grandmother and repaired fibers, smudged her, and ceremonially carried her from the library to her new home with drumming, singing, and regalia. The artist who facilitated the course where she was born came to advise us on the move saying, "you wouldn't just take your grandmother out of her home without giving her a bath and making her look her best, would you?" Our Indigenous Epistemologies courses are held on the land with involvement of revered knowledge keepers. These are all efforts to center Indigenous knowledge, worldview, being and ways of doing, teaching and learning.

Letting the community lead

Centering Indigenous ways also means prioritizing community needs and being accountable to the lands and the people in long relationship to the land. Within IED we have a few ways of ensuring accountability to community relations and privileging community voices. One of these is the Advisory Board that is Indigenous led and composed primarily of Indigenous members, and a vital one is our community partnership process that lays the ground for all of our Indigenous language revitalization work.

Laenui, 2000 described the dreaming as one of the critical decolonization processes necessary to effect change in our communities. He describes coming to a commitment through dreaming and dreaming about the dreaming: "the full panorama of possibilities are expressed, considered through debate, consultation, and building dreams on further dreams which eventually become the flooring for the creation of a new social order" (p. 145). In IED's work I hope that we are part of the dreaming and the dreaming about the dreaming, and also the commitment and action that Laenui described. Our programming is about fulfilling a vision that was forged by many community voices coming together and imagining a future where our people spoke their languages and carried out their ceremonies following the seasonal calendar. To enable the language dreams of the community, programs were created that were designed in such a way that they would be inclusive of all learners and would contribute to the building of ever greater language and teaching capacity in the communities.

IED's external Advisory Board is made up of members from local First Nations, and Indigenous education partners and has been in existence since 1999 when IED was a fledgling program inside of another department. The original co-chairs, Janice Simcoe, Director of Eye? Sq̓'lewen of Camosun College, and Nella Nelson of Aboriginal Education, School District 61, while recently retired, continue to co-chair, and their long experience and wisdom is much valued. Three times a year the board meets with members of the Faculty of Education (most in attendance are from IED plus the Dean of Education). The community members in attendance provide updates on activities in their respective settings and how IED can support their work. IED provides updates on activities in our unit and in our programming and also brings questions to the board when some direction is sought. It is here that the board often speaks strongly and forcefully about the need and ways to increase the number of Indigenous teachers in the province, or how to build understanding among non-Indigenous teachers in the local school districts. This is an example of how IED takes direction from community on how to engage in programming that is relevant, reciprocal respectful and responsible (Kirkness and Barnhardt).

Indigenous language revitalization and partnering with community

UVic is known internationally for its Indigenous Language Revitalization work, thanks in no small part, to IED's Director of many years, Dr. Onowa McIvor whose work has been foundational. IED's ILR programming is most closely tied to community partnership, hosts Indigenous student cohorts and directly contributes to Indigenous community aspirations. There are many features about our ILR programs that put community first. We strive to serve Indigenous students, peoples and communities well, helping to turn around some of the barriers that prevent Indigenous people from accessing university, staying in programs and completing them. So many aspects of our ILR work directly benefit Indigenous community, such as being able to change policies to facilitate student access and participation, including learners who wouldn't normally get a chance to go to university, and contributing to community needs by teaching the teachers who will be certified language instructors in the local schools. When we enter into a partnership with a First Nation we rely on Elders, local language mentors and knowledge keepers and we base our learning in community as much as possible. In a recent video made to illuminate the impacts of our Indigenous language programming beyond language learning, one IED student said: "Our classes were always in the community which made us more comfortable. I had babies while I was in those courses ... they were on my hip, wrapped and sleeping on the table. When I had to present my classmates were holding my babies ... We've lost so many of our fluent speakers in the last 10 years ... but the beautiful parts that have blossomed out of this whole experience in the last 10 years ... so many of our cohort that have graduated are still out there teaching" (IED and UATĒ, 2022). Being in community and respecting community ways has helped to build capacity among current speakers to teach the next generation in immersion schools that did not exist when they were younger.

Another Diploma in ILR graduate observed, "These Elders that were previously advocating for this language became the teachers of this course and the professors that came from UVic were more like the facilitators and it made this a natural space for learning [the language]" (IED and UATĒ, 2022). Indeed, we know the language resides in the community and we rely on that knowledge as the basis for the programming we do. While we have built the programming to be responsive to the latest research and to address community needs and desires and we share that in our courses, we also step back and give the knowledge keepers and language mentors the space and time needed to prepare the next generation. Dr. Wanost's'a7 Lorna Williams, professor emeritus and the founder of many IED courses and language certificates, said, "Wherever this program has been I know it has made a huge difference. It just lifted the people. I see those young people now and they're the key movers and leaders in their communities. That's what language does" (IED and UATĒ, 2022).

All IED language programming (with the exception of an elective course, SENĆOŦEN for beginners, that is open to anyone on campus) is a partnership with community, whether it is a First Nation or a Language society controlled by Indigenous members. Instead of individuals applying to a program with a list of required and elective courses, a community inquires with IED about the possibility of a partnership to deliver a program. IED and the community partner converse and explore timelines and feasibility. After coming to an agreement, we enter into a partnership with the community selecting the students who will enter the program.

UVIC requires the learners to register as students. Early on it was decided that community members should not be denied access to learning their language because they lacked credentials. There is an arrangement within the university to allow exceptional entry for our certificate students who may not have a high school diploma or specific pre-requisite courses. This means no one is denied opportunity to learn their language because of a lack of academic preparation. The IED staff and the local community coordinators work together to encourage students to register assisting them with the forms and providing plenty of support. Furthermore, the Indigenous language programming is laddered to provide learners with confidence as they move through each year of credits. The ladder approach to programs responds to a concern Indigenous teachers and students have voiced for years about retention and completion. Laddering has the advantage of providing successful exit opportunities at multiple points so that students who need to stop are recognized for their achievement. Those who continue receive encouragement to keep going.

Laddering programs: how it works in practice

Year 1 is either a Certificate in ILR (CILR) offered in association with UVIC Continuing Studies or the Certificate in Indigenous Language Proficiency Building (CILP) through IED. IED's language programming is a partnership with Linguistics. In the earliest days Linguistics had the professorial capacity and offered several courses that could be offered as Linguistics or IED. As Linguistics professors retired or moved away from the unit, the pendulum has swayed so that the majority of the teaching and administration takes place within IED. Communities choose whether to enroll in the CILR or the CILP. The CILP was a pathway that existed when I started as Chair but was a modified CILR. It was created in partnership with Indigenous communities who noted that students wanted to go deeper into the language with the certificate and were less interested in a couple of the courses that were more theoretical or academic. With some tweaks to the courses included as requirements and the overall number of credits required, the CILP was proposed and approved as a credential in 2019 that strongly contributed to one's proficiency development. The courses were designed to be taken in a certain sequence that promoted ever deepening knowledge and skill.

At the completion of either certificate, graduates are eligible to enter into the Diploma in ILR. When they complete the Diploma after 1 year, they are likely eligible to enter the B.Ed. in ILR (more on the BEDILR in the next section). This is a 4 year B.Ed. that leads to a certificate to teach in BC. The first 2 years are the Certificate and Diploma. The following 2 years provide all the education courses to make one eligible to apply for a teaching credential. The idea, borne out of consultation with communities and advisory

board members, was that a program was needed to prepare teachers to teach the language and in the language in their communities upon completion.

The Certificate and the Diploma courses are taught entirely in community or close to community (not on campus). They are usually all one language dialect and there is considerable attempt to be on the land and learn from place and community as much as possible. There are courses that employ the Mentor-Apprentice Program or MAP where mentors are identified and speak with apprentices in settings where the language vocabulary and application is relevant. Mentors may meet on the land or waters or in someone's kitchen making a meal. The goal is to speak in the language the entire time without relying on English to fall back on. More hours and practice in the language lead to more proficiency and increasing fluency (Hinton et al., 2002, 2001; See also FPCC, 2022).

IED's graduate programming includes the Masters in Indigenous Language Revitalization. (MILR). This 2-year program for ILR leaders and practitioners is designed to build leadership skills in ILR and training in research that furthers language revitalization work. The MILR begins with four courses that packaged together serve as the Graduate Certificate in ILR. Students who move on complete additional courses culminating in a research project fulfilling the requirements for an M.Ed. or M.A. Students are encouraged to complete a project that will assist their community with some aspect of a language initiative. It could be a curriculum in language, or the establishment of a MAP handbook for community language leaders, or a study of silent speakers, or creating an Indigenous language immersion home just to name a few of the projects from the first 5 years of the department.

The MILR, like the undergraduate ILR programming, takes a cohort-based approach. The cohort provides a built-in support network as the whole group moves through the courses together building a community of learners who become strong support for one another emotionally, and culturally. Cohorts have been known to be effective in Indigenous student retention (Landertinger et al., 2021).

In addition, ILR programming is scheduled in intensive course offerings with 39 h over a week to 10 days. One of our CILP offerings was offered over the term 1 weekend per month, rather than 3 h a week for 12–13 weeks like most UVIC undergraduate courses. Intensives allow learners to balance their education with their work, family and community responsibilities. For the MILR students, rather than move to Victoria for 2 years, they can visit for short periods of time. The 2022 MILR will try something new, picked up after the 2020 cohort was forced by the pandemic to move online. The 2020 cohort reported that they preferred some of the courses to meet more frequently for shorter periods as they did when they met online weekly. For 2022, some of the MILR courses will be offered in a blended format where the cohort will take them online for several weeks, then come together in an intensive in-person session. It will allow them more time to digest material and longer time to complete some assignments compared to an all in-person intensive. This flexibility in course scheduling is another feature of ILR programming that is responsive to learner lifestyles and puts community and learner/family priorities first. MILR course sequencing and content is reviewed every 2–4 years in response to student and instructor feedback to ensure that the material is relevant and the pedagogical approaches are engaging, flexible and suited to student lives. Like all the ILR programming, its flexibility, relevance and power stems from strong partnership, trust, respect and commitment to collaboration that is fostered between IED and the community.

Reconciliation and resurgence

While the students taking our teacher education courses outside the BEDILR are primarily non-Indigenous, altering the way all teachers are trained will change how generations of Canadians are educated about Indigenous histories, perspectives and futures. Our advisory board has prioritized our contributions to changing teacher education for the betterment of our people (and all people). In these ways our efforts to transform teacher education with an Indigenous lens is an attempt to foster a cadre of professionals committed to reconciliation.

The first innovation to note is course IED 373, EL TINIWT. This is the required course for all teacher candidates at UVIC and IED provides the instruction and curriculum oversight for the course. This requirement was established in UVIC before the province moved to make it a requirement for all teacher education programs in BC, and after the TRC Calls to action brought similar moves across Canada. The course provides

[a]n exploration of learning and teaching approaches to better address the educational requirements of Indigenous children, youth, and adults through understanding Indigenous peoples' relationship with land, language and community. Topics include: study of who Indigenous peoples are, diversity amongst Indigenous peoples, ways to Indigenize the learning and educational environment, and of the systems that impact teachers and learners.

Students get an overview of residential schools, the 60s scoop, and Indian Control of Indian Education. They also get an introduction to local ways of teaching and learning and the First Peoples Principles of Learning (FNESC, n.d.). One of the encouraging things that is happening right now is that we are starting to see students arrive with a greater understanding from which we can scaffold. We are not starting from zero knowledge in our 373 any longer. In 2022, IED will overhaul the IED 373 curriculum and resources to go deeper with our students, as they already have some understanding and exposure to Indigenous education histories, partly as a result of high schools and universities responding to the Calls to Action of the TRC by covering residential schools in curriculum and offering more Indigenous courses. These moves are complemented by the introduction of new provincial policies

that require ever more content and approaches that emerge from Indigenous cultures and knowledge. One example is the new professional standard for educators introduced in 2019 requiring knowledge of Indigenous perspectives, histories and pedagogies (BCTC, 2019), and the recently announced Indigenous course requirement for all secondary graduates starting in 2024 (BC, 2022).

Another way we are weaving Indigenous perspectives into the curriculum is through our Summer Institute. Every June, the IED Summer Institute provides the UVIC Secondary program students with an option to take 4 IED courses in a single month. The courses usually consist of an Indigenous Education History course, one in Indigenous Pedagogies, one in Local Knowledges and another course that is so unique, a book has been written about it (Tanaka, 2016). The IED 473 course, (CENENITEL TW TOLNEW: Helping each other to learn), had its genesis as a way for Indigenous presence to be established in the Education building at UVIC. A guest artist is identified and co-teaches the course with a UVIC faculty person (largely in the role of administrative facilitator). An art project is chosen and the whole class work together to make the piece that will have a home in the building. Past projects, still visible in the education building, include the Old Man pole Schalay'nung Sxwey'ga, representing Thunderbird and whale as protection, and XAXE SIÁM SILA, the Grandmother Mural that used to be the focal piece of the curriculum library, since moved to the main lobby of the Education building in a ceremony in 2018, as well as a button blanket representing numerous Indigenous values. The course has also been used to gift songs to the School District for teachers to use with young students (the Earth Songs course), and a canoe project (the canoe was moved to T'SAWOUT when it started to dry out—it needed to be used in the water or it would split). The past few years have seen students in the Summer Institute guided by a renowned Coast Salish artist to make hand drums with a Coast Salish art design painted on the skin. When they learn that it is custom to gift their first drum to someone, the emotions are high and it is an excellent teaching opportunity. The 473 course has also been used for making paddles, learning the metaphor of paddling together and paddling forward, with the knowledge gained from the course and the whole set (it was taken by the working teachers to close off a 13 month learning period in Indigenous education).

Tanaka (2016) looked at how pre-service teachers were transformed by the 473 course *Earth Fibers* which immersed them in Indigenous ways of learning and teaching by working alongside Indigenous wisdom keepers. "Together, they transformed cedar bark, buckskin, and wool into a mural that tells stories about the land upon which the course took place. In the process, they discovered new ways of learning that support not only intellectual but also tactile, emotional, and spiritual forms of knowledge" p. 22. Tanaka (2016), identified a number of teachings that emerge from the way in which the 473 course is done that represent fundamental Indigenous education values. Included among her findings were: working/walking alongside; putting aside the familiar/connecting to the unknown; letting go of perfection; fear of engaging in emotional territory; learning is uncertain and requires an inquiry stance; appreciating spirit; knowing nature and place; reflexivity requires safety; showing is effective; learning in families through story; opening up to other ways of knowing; faith in the learner; getting out of head and into hearts and hands. Our 473 course embodies these pedagogies, as does our whole Summer Institute.

In addition to providing in-depth experiences for future teachers, IED runs a 10 course set for in-service teachers to help them more fully and confidently integrate Indigenous perspectives in their work. Studies with teachers have shown there are many reasons they need to build confidence to move through their hesitancy (Carroll et al., 2020; Bascuñan et al., 2022; Nardozi and Restoule, 2019). Completing the 10 courses gives teachers the eligibility for a pay upgrade in BC and greater depth in Indigenous approaches and values. The teachers move as a cohort through the 10 courses. We have also allowed learners to register in one or two courses as electives for their programs or to acquire credits they're missing to be eligible for the upgrade. The courses consist of 2 offerings of the 473 course with 2 different projects. In addition to courses on pedagogies, teaching worldview through media, literature, and environment, there are two courses that are taken back-to-back going deeply into the self in relation to Indigenous education. Called Allies and Activists and Foundations of Decolonization, the two courses are meant to change one's orientation toward land and people, understanding responsibilities and obligations to these relationships and determining how to recognize colonial and racist structures and to advocate and work toward their dismantling. The courses begin with self and seeing one's location as a source of power and agency in order to disrupt racism and colonialism inside structures, policies and practices. The ultimate goal is to make changes that better life for Indigenous learners and communities. These courses were newly created and added (in 2021) and it's early still to know what impact they will have on the teachers moving through them in 2023 but we remain hopeful that some will find this learning transformative.

In the special topics versions of these two courses that were offered online during the pandemic, students reported being completely transformed. It caused them to question assumptions they had made about Canadian land settlement, and what they knew about the Indian Act, reserves, treaties and Aboriginal title. It fostered strong connections among the learners in the cohort and commitment to calling out problematic practices in their school districts. It encouraged teachers to find ways to make relationships with local Indigenous communities and to let that relationship guide their practices and learning journeys. The Integrated Course Set is designed to give teachers an opportunity to learn from and about Indigenous knowledge, and to make valuable connections to local Indigenous communities to strengthen the learners' understanding of Indigenous peoples and societies. The 10 courses are offered in concert with each other resulting in an immersive experience in Indigenous learning, teaching and knowledge where in-service teachers gain valuable experience and make meaningful connections.

These courses are scheduled to be tailored to teachers' schedules. The intensives are in July when they are not teaching so they can travel to Victoria and take the 6 summer courses over 6 weeks. The online courses are scheduled after school hours so that teachers can attend synchronous portions one night a week and do assignments the rest of the week at their own pace. Flexibility and relevance to teachers are the motivations for the scheduling.

In 2015, a new position was developed within the Faculty of Education (FoE) called the Indigenous Resurgence Coordinator (IRC). This position was created with the FoE commitment toward implementing the TRC Calls to Action pertaining to Education

and toward the goal of Indigenization and Indigenous resurgence in the FoE. The position has been able to advocate for greater inclusion of Indigenous content and resources in courses taught within the faculty and has provided support to faculty and instructors attempting to do more and need help with changing their approach or reviewing their course outlines. The IRC has also organized workshops on decolonizing practice, direct action support and trauma-informed learning. A challenge with the IRC role is that sometimes they are understood and used in token ways or have little power to enact the change that they see is needed in the unit. For IED, the IRC role has provided much needed program coordination support, especially in organizing the summer institute for secondary teacher candidates and the integrated course set for in-service teacher professional development. They have also been instrumental in forging relationships across campus and in the community to bring Indigenous resurgence activities forward in both spaces. It is hoped that in the future the training the IRC position provides to faculty members will build capacity for non-Indigenous teachers to more confidently take up reconciliation work instead of relying on support from the IRC or guest speakers.

Challenges

Centering Indigenous ways in a Western hegemonic institution means there are struggles. We are still in a university, not as nimble as local colleges in moving to assert Indigenous presence and programming, despite UVIC being recognized in Macleans' annual university rankings as number 1 in Indigenous visibility every year since the category was created in 2018. We are subject to collective agreements for staff and faculty that override Indigenous initiatives that might impact work contracts. We are still subject to BC rules and regulations governing academic programming like teacher education which is sometimes at odds with our own ways.

In some ways we are tokenized. As [Smith and Yang \(2019\)](#) observed,

The critical questions in terms of the call to "Indigenize" are, Who is making the call? Who is controlling the way that call is articulated? What Indigenous capacity is being developed and how is that being sustained over the long term? Sometimes these new ideas are opportunities to advance Indigenous thought and scholarship, Indigenous engagement and participation, but sometimes they simply add more work on to the shoulders of the few Indigenous scholars and other staff available in an institution with little attention being given to growing capacity, developing careers, improving relationships, or indeed transforming institutional practices" (p. 6/7).

There are still faculty that feel they don't need to include Indigenous programming or readings because "don't they have IED for that"? There is an assumption that students will have Indigenous material covered by us relieving them of the responsibility to cover it themselves or know it themselves. Some go as far as inviting IED to do the work in their classes. We have been asked to do land acknowledgments for them or to teach the Indigenous material as guest lectures.

There is also confusion within the institution about what it is Indigenous faculty do. UVIC has an Indigenous Studies program, an Indigenous Governance program and Indigenous Education (as well as many other great Indigenous programs), and we receive each other's mail and phone calls. Somehow still, with some in the university, anything Indigenous is treated as interchangeable.

Perhaps the biggest challenge is sustained funding for IED programs and students. ILR classes typically have fewer students than a regular class which is good for instruction, learning and practice but does not fit the standard university funding formula. In this time of neoliberalism, university programs often run on a cost recovery basis and are driven by market demand. Our ILR programming requires external funding to be able to run, be it from the communities themselves or through external grants. Each community delivery requires our partners to have their own (partial) funding in place as the added costs of ILR programs are not covered by university base funding. Many communities prioritize the language recovery and education among their members, but there are many others who are forced to cut language and culture funding when faced with housing, employment, safety and other needs that are not adequately addressed. Strong support for the added expense of ILR work would be good to see among the governments that were involved in the depletion and denigration of Indigenous languages during the residential schools era.

In addition to generating less revenue due to fewer students, ILR programs face additional costs. We often have to hire a coordinator that serves as a translator of university policy needs and deadlines for the Elders and language instructors who (rightly so) want to focus exclusively on sharing the language. Language mentors are often hired in addition to the facilitators who are the named appointees to courses. University guidelines don't accommodate this extra expense. Coordinating with community takes a lot of meeting time and labor not typical to most other programs. To remove barriers to students, much of the university interfacing is done for them. This is one of the reasons we need the staffing we have that is high for the number of faculty and students we have in our unit, but is required for the kind of programming that we do.

If universities are to truly work toward reconciliation, ILR has to be looked at as a long term investment rather than as a revenue stream. There are added costs for doing community-based programming such as travel, payment for community people, elders, knowledge keepers and language mentors. The MAP approach is costly because we pay our mentors as they are expected to do one on one language work for 75 up to 100 h per term per student (over and above appointed instructor costs). The added expense of renting space in community is not included in cost recovery and, it must be noted, even when we host courses on campus, running them in intensives means we often can't find suitable space on campus. Renting space for blocks of time is an added cost, as is food and gift giving which are culturally appropriate. Some courses require hiring a facilitator who deals with all of the administrative pieces of course instruction such as entering grades, processing academic concession requests and working

with university staff on issues in addition to the language speaker who is given the opportunity to focus exclusively on language teaching (they may find the whole workings of universities foreign and confusing).

While our admissions processes and partnership approach values the collective over the individual, as is common and expected in traditional Indigenous ways, we have experienced an institutional barrier in the funding of graduate students. The Faculty of Graduate Studies has a formula for providing support to units with a graduate program. The funding provided is meant to be transferred to the students in a way that the unit prefers. Perhaps one student receives a large grant or an incoming student is given a substantive entry scholarship. In IED, we like to distribute it as widely as possible to the entire group. However, this ends up being a small amount for each student (sometimes a \$1000 each—the minimum that can be disbursed). While every penny helps, it's also clearly not a system that has in mind supporting the collective but rather values competition and individualism. More Indigenous graduate student support is needed to truly reflect Indigenous values of community and collective. "Indigenous students said funding played a critical role in the success of their post-secondary experience. If the TRC's Calls are to be fulfilled in post-secondary spaces, it is important to increase funding for both Indigenous students and Indigenous services in post-secondary settings. Students said both play a critical role in their ability to be ready to learn and succeed in their programs" (Indspire, 2018, p. 7).

Sometimes our attempts to Indigenize practice have encountered colonial barriers that require us to challenge institutional practices and policies. For example, in our BEDILR, we have found the field placement guidelines of the provincial body overseeing teacher certification at odds with the realities of Indigenous community and language learning. The provincial conflict of interest guidelines require teacher candidates to be placed in schools where they have not worked before and where they do not have any close relations. When you are learning an endangered Indigenous language, the number of schools and communities where one can have a placement is incredibly low to begin with. It is highly likely that a candidate will have relatives who work there. IED succeeded in having our 2020 BEDILR cohort granted a one-time exemption for this condition but longer-term removal of these restrictions is a direction the province should be considering. As McIvor et al. (2018) noted, "the time to devote to language proficiency development continues to be limited by teacher education regulation leading to certification. An obvious new direction is the need to negotiate an alternative structure for degrees which are dually focused on Indigenous language proficiency building and creating professionally certified teachers" (p. 201).

One of the biggest challenges to our sustained success is Indigenous faculty and staff burnout. We are in a faculty of education as the smallest of four administrative units. We now have our autonomy as a department but being a faculty of just six (less with leaves) means administrative and service loads are significantly higher per faculty person than in larger departments. This is especially true as Indigenous faculty are called on by other units across the University to respond to the TRC calls to action for reconciliation, and demands for equity diversity and inclusion work. Indigenous faculty members are being pulled into more and more labor, some unaccounted for and undervalued. Indigenous faculty members get asked to support Indigenous students, mentor junior Indigenous faculty, be the Indigenous rep on graduate committees, and be an equity rep on service, representation and hiring committees. Indigenous faculty also commonly get asked to serve on research projects so that colleagues can access Indigenous funding envelopes. Public lectures, guest class visits and review of curriculum and policy with an Indigenous lens or perspective are just more demands on Indigenous faculty time that are all important but take a toll on one's own career progress, community commitments, and especially one's family and individual health.

Sessional instructors and limited term appointments have helped IED through some difficult periods with unexpected faculty sick leaves and the passing of one of our beloved colleagues but they should not be seen as a long-term solution to the issue of understaffing. In addition to the ethical issues surrounding the chronic underpaying of sessional instructors, term appointees are unrealistic supervisor choices for graduate students which is part of why faculty burnout occurs. Universities need to hire more Indigenous tenure stream professors in all areas of study if they want to be part of sustained and meaningful reconciliation efforts.

Looking forward

While IED remains embedded in an institution not of our own making that continues to have standardized requirements that restrict the full freedom and self-determination of our Indigenous knowledge systems and ways of being, there is still the possibility for positive social change as a result of our programming. I feel that in many ways our little unit is contributing to Indigenous futures in the ways that Smith and Yang (2019) wrote about:

My observation of earlier Maori or Indigenous scholars was that the academy consumed them, changed them, distracted them, and isolated them from the Indigenous world and that we, as a community, could not trust all of them to work for us. My critique of colonialism was not just about looking at the colonizer but also looking at what colonial hegemony was doing within our own Indigenous minds, spirits, and behaviors. I saw the need for a decolonizing agenda that dealt with the whole of the dialectic of colonizer-colonized and recognized the role of education as a means to transform colonialism at deep levels of knowledge, pedagogy, the shaping of minds and discourses.

Now, I feel that I am writing as part of a community of Indigenous scholars who have deepened understandings of the work of decolonizing education and, importantly, created new approaches to education that theorize, revitalize, enhance, and produce Indigenous educational experiences that support Indigenous futures" (Smith and Yang, 2019, p. 6).

Our work with Indigenous language revitalization, in partnership with Indigenous communities, taking guidance from our partners and our community-led Advisory Board, are a direct support for Indigenous futures.

Indirectly, if we ever want to see change in the relationship between Canada and Indigenous people, the next generation of Canadian school students has to learn some harsh truths about our shared history. They also need to learn about our current contributions, and aspirations and dispel stereotypes and fear about Indigenous people. One of the best ways to ensure this result is to give future teachers the skills they need and foster an orientation toward doing the right and responsible thing. Our teacher professional development activities and Summer Institute are contributing to teachers who will take the steps toward ever greater decolonization and inclusion of Indigenous perspectives and content in their own classrooms. Further, our BEDILR program helps ensure that Indigenous languages will be taught in schools, day cares, language nests and many other spaces.

It is an honor to be a part of the dreaming and the commitment and to action on our visions (Laenui, 2000). Perhaps we are seeking radical reform within a soft-reform space (Andreotti et al., 2015). Perhaps we are finding ways to hack a system (the university) to provide for flourishing Indigenous futures when universities have been opposed to Indigenous knowledge and being from their founding (Andreotti et al., 2015). By centering Indigenous knowledge, being accountable to community and always striving to be a place that is respectful of Indigenous people and practices, relevant to Indigenous community approaches, reciprocal to Indigenous communities and responsible to our relations to land and people, I believe IED is making space for decolonial, Indigenized spaces that support community aspirations and futures.

The Department of Indigenous education at UVIC has only been here since 2017. We are just getting started. I have been grateful to contribute these past years and can't wait to see what will happen next.

Unceded and Occupied Shared Territories of the Coast Salish Peoples.

The aim of this paper is to explore what it means for higher education to be in good relations with Indigenous peoples' self-determination and resurgence in Kanada,¹ also known as Canada. "Indigenous resurgence means having the courage and imagination to envision life beyond the state" as defined through colonially imposed government structures (e.g., policies, programming) (Corntassel, 2012, p. 89). By focusing on "everyday" acts of resurgence, one disrupts the colonial physical, social and political boundaries designed to impede our actions to restore Indigenous nationhood (Corntassel, 2012). The specific context for this disruption of settler colonial narratives is Canadian higher education. I share understandings of what it means to wholistically support Indigenous resurgence that enacts Indigenous visions of transformation and change at the individual, community, and organizational levels. It is my intention to weave these lessons of how to be in good relations by sharing a few research stories. It is my intention to weave these lessons of how to be in good relations by sharing a few research stories. As I begin to think which stories to share, I reflect on the words of Kirkness and Barnhardt (1991), as their seminal work has been a guide for my own scholarship in Indigenous and higher education.

What First Nations people are seeking is not a lesser education, and not even an equal education, but rather a better education — an education that respects them for who they are, that is relevant to their view of the world, that offers reciprocity in their relationships with others, and that helps them exercise responsibility over their own lives. It is not enough for universities to focus their attention on "attrition" and "retention" as an excuse to intensify efforts at cultural assimilation. Such approaches in themselves have not made a significant difference, and often have resulted in further alienation. Instead, the very nature and purpose of higher education for First Nations people must be reconsidered, and when we do, we will find that the entire institution, as well as society as a whole, will be strengthened and everyone will benefit.

Kirkness and Barnhardt (1991, p. 14).

I intend to exemplify what it means for Canadian higher education to be in good relationships with Indigenous people's self-determining vision of education through an examination of system transformation. Ultimately, these stories are told to share of system transformation of education, by and for Indigenous peoples has occurred in Canada.

A clear vision of what Indigenous people's had for education of their people was first articulated in *Indigenous control over Indigenous education* (National Indian Brotherhood, 1972). As the authors of the report stated "It is a statement of the: philosophy, goals, principles, and directions which must form the foundation of any school program for Indian children" (National Indian Brotherhood, 1972, p. iii). This document has been guiding Indigenous resurgence through system change by and for Indigenous peoples across this country over the last 50+ years. Furthermore, this document provided an Indigenous re-visioning and re-awakening of the purpose of higher education for Indigenous peoples.

Considering the great need there is for professional people in Indian communities, every effort should be made to encourage and assist Indian students to succeed in post-secondary studies

National Indian Brotherhood (1972, p. 13).

¹Canada's name, is intentionally spelled here with a K to acknowledge the origin of the name is taken from Huron-Iroquois word "kanata," meaning "village" or "settlement."

Within their vision for post-secondary education, this report speaks to the recruitment processes and programs, entrance requirements to focus on ability, aptitude, intelligence, diligence, and maturity. There was also direct mention to federal financial support “those who have the motivation and talent to do post-graduate studies, should receive total financial assistance” ([National Indian Brotherhood, 1972](#), p. 13).

My goal is to help readers understand how transformation of Indigenous education in Canadian higher education has occurred through programs, policies, people, and practices. As the reader—whether settler or Indigenous—one is being asked to actively reflect and consider their own actions and commitments to transforming Indigenous education. This responsibility is both an individual and collective community effort deepen understandings, and ultimately one's enactment, of what it means to be in good relations in these efforts.

Unsettling colonialism

Most Indigenous communities living within colonized circumstances still suffer high and disproportionate levels of educational underdevelopment. [...] We intentionally use the term “underdevelopment” to connote the understanding that the “problematic” of Indigenous education is not just about the Indigenous learner deficit but also the recognition that there are often systemic and structural impediments that results from colonizations and associated approaches.

Jahnke and Smith (personal communication June 17, 2021).

Many of us within higher education systems critique the very structures that we are aiming to decolonize and leverage the resources available to us as faculty, administrators, and staff to support Indigenous resurgence through programs, policies, and practices. My thinking has been influenced by those Indigenous scholars who have been working to transform Indigenous post-secondary education (e.g., [Archibald, 2008](#); [Archibald et al., 1995](#); [Battiste, 2013, 1998](#); [Brayboy, 2005](#); [Brayboy et al., 2012](#); [Cote-Meek, 2014](#); [Cote-Meek and Moeke-Pickering, 2020](#); [Kirkness, 1998](#); [Kuokkanen, 2007](#); [Parent, 2017](#); [Restoule, 2011, 2005](#); [Restoule et al., 2013](#); [Shotton et al., 2013](#); [Stonechild, 2006](#); [Styres, 2017](#); [Waterman et al., 2018](#)). Such researchers are sometimes explicit but many times implicit in the ways that they individually and collectively support transforming the academy for Indigenous peoples. In fact, like [Comtassel \(2012\)](#), I see decolonization and resurgence as “interrelated actions and strategies that inform our pathways to resistance and freedom” (p. 89).

As an author in this collection, I recognize that the educational systems we are trying to transform, from within and from the outside, are colonial—even Indigenous K-12 schools and/or post-secondary institutions in Canada are required to engage in relationships with settler-organizations through transfer agreements, accreditation, and other fiscal reporting structures at provincial and federal government levels—while they simultaneously operate Indigenously through their governance system, academic programs, and support services. While Indigenous peoples work to decolonize and Indigenize alongside allies—we are simultaneously engaging, pushing back, and resisting imposed policies and practices that are deeply entrenched in settler colonialism. I am reminded of Ruana [Kuokkanen's \(2007\)](#) book “Reshaping the University: Responsibility, Indigenous Epistemes, and the Logic of the Gift”, in which she urges readers to consider how emmeshed our lives are with colonialism, and cautions us to be ever mindful that this is the context that we are in:

When we ignore the ways in which we are implicated in academic structures, and when we assume that we can remain uncontaminated by outside influences despite our daily interactions with the academy, we are only contributing to our own marginalization and to the construction of a monolithic understanding of our projects (p. xv)

This requires one to be conscious of the ongoing tensions of new forms of colonialism being enacted. [Kuokkanen \(2007\)](#) further suggests

that it is up to the academy to do its homework and address its own ignorance so that'll be able to recognize and give unconditional welcome to Indigenous peoples, worldviews and philosophies. But before the academy can recognize the gift of indigenous epistemes, it will have to profoundly transform itself; it will not be enough to merely include indigenous epistemologies (i.e., Indigenous systems of knowledge, or ways of knowing) in pedagogy and curricula. First and foremost, the academy will have to acknowledge that it is founded on the very limited conceptions of knowledge in the world. Because this constraint perception the academy cannot grasp or even hear views that are grounded in other epistemic conventions (pp. 2–3)

Indigenous ways of knowing and being encounters ongoing resistance and ridicule in a colonial western society where neoliberalism, economic exploitation, cultural oppression and individual gains in essence are valued over and run counter-to Indigenous values of community, collectivism, and interconnectedness (Jahnke & Smith, personal communication June 17, 2021). In recognizing the reality of colonization within our lives, “what we need instead is a more nuanced language as well as a careful understanding of our various circumstances and situations. Having established these will be able to examine more closely certain common indigenous philosophical premises and principles” ([Kuokkanen, 2007](#), p. 25). We cannot be complicit in assuming

that with transformation we will all of a sudden be in our ideal utopia nor that what works in one context will be universally transformative for all—yet, in reflecting on all the changes that have been advanced here in Canada—a beacon of possible hope is provided to help guide us through this ongoing resistance, reclamation, and resurgence. “But no matter how the educational landscape has been transformed, the transmission and continuity of Indigenous knowledges have been the foundation for learning that Indigenous families, communities, and nations have always maintained for their children” (Hare and Davidson, 2020, p. 203).

What it means to be in “good relations”

Central to Indigenous resurgence is the understanding of what it means to be in good relations; it is a cultural value and philosophy shared among many Indigenous peoples grounded in one's relationship with the animate and inanimate. It is a concept that is not bound by human-to-human relationships but our interconnected relationships to the physical and metaphysical worlds (Aluli-Meyer, 2006; Deloria, 2001; Kuokkanen, 2007; Mika, 2017). It is a responsibility to carrying one's self in good relationship on this planet. Being in good relations translates wholistically, in seeing oneself connected to family, community, and nation within a balance of the physical, emotional, spiritual, and intellectual (See Fig. 1—Indigenous Wholistic Framework). From their seminal article “First Nations and Higher Education: The Four R's—Respect, Relevance, Reciprocity, Responsibility,” Kirkness and Barnhardt (1991) describe good relationships as “reciprocal relationships,” which they deem important aspect of transformation, as they explain

One of the most frustrating aspects of the university experience for First Nations students is the role dichotomy between the producers and the consumers of knowledge in university settings. The conventional institutionalized roles of a university faculty member as the creator and dispenser of knowledge and expertise and the student as the passive recipient of that knowledge and expertise have a tendency to interfere with the establishment of the kinds of personalized “human” relationships to which First Nations students are most likely to respond (p. 9)

In naming the tensions of the dichotomy, they not only articulate the ongoing tension of being Indigenous within the academy but also provide insight to what is truly of value within Indigenous education—it is a journey to being in relationships with each other learning from each other, in essence—reciprocal learning. Respectful and reciprocal learning sets the foundation of being in good relationships.

Fig. 1 Indigenous wholistic framework (Pidgeon, 2005, 2014, 2016a).

The Indigenous Wholistic Framework both theoretically and methodologically has guided and informed all aspects of my scholarship as it centers place and Indigenous ways of knowing and being in a wholistic sense. It connects the physical, emotional, cultural, and intellectual needs of the individual with their family, communities, and beyond. Around the framework, I have taken up the 4Rs (Kirkness and Barnhardt, 1991) to reflect the values that guide meaning making across the educational system—from the individual to community levels.

In thinking what transformation may mean for Indigenous education within this Framework, I think about various organizational and systemic structures that are involved through the interconnections and interrelatedness of policies, programs, people, and practices (Pidgeon and Rogerson, 2017). These 4Ps build upon the 4Rs embedded in the Indigenous Wholistic Framework moving this theoretical framework into a system change model for Indigenous education, that centers and privileges Indigenous ways of knowing, being, and doing in relationship to the lands and waters in which we do this work. I attest this is not the only way to do this work, it is just one way, one of the challenges of working within the academy is the ongoing homogenization of knowledges, practices, and ideas to be the “one” solution. This framework and what is shared through this writing is an offering of gifts of knowledges, experiences, and stories shared with me through research—many experiences inform what is shared—I raise my hands in thanks to all those who have helped inform, guide, and influence this work. In this acknowledgment, I honor the responsibility I have to those who have shared their stories with me; this responsibility lasts well beyond the conclusion of a particular research project. It is an example of how being in good relationships with Indigenous peoples is lived in practice.

Tensions navigating transformation

In centering how many Indigenous peoples articulate being in good relationships; we can now turn our attention to the tensions, pushes-pulls, and intentional manipulation of what it means to be in good relationships Indigenously while in a predominately Western educational system. In Canada, the ongoing colonial project is evident through power, the privileging of Western-valued ways of doing and being, and the reproduction of these systems over time. This educational system is rooted in settler colonialism and consequently, this privileging of whose knowledge counts is deeply connected to who maintains power over the lands and peoples connected to these lands. This power then influences the communities and individual actions that further enact colonialism through lateral violence, racism, and commodification of Indigenous knowledges.

Leigh Patel (2021) writes in her book *No Study without Struggle Confronting Settler Colonialism in Higher Education*, “barriers to higher education may take many forms, and although different populations experience different forms of discrimination, they are connected through the larger structure of settler colonialism” (p. 6). She then eloquently outlines how settler colonialism is interwoven into every aspect of higher education from the lands upon which institutions reside, to the policies that dictate who has access, who can afford access, and who can truly benefit from higher education (e.g., attainment of individual wealth and property due to their education). Kuokken (2007) and Patel (2021) make evident the ways the ongoing settler colonialism is deeply intertwined in any calls for transformation and change (e.g., Indigenization, decolonization, Land back).

The cautionary tale in this work is that in some ways, the more the Western canon comes to understand and embrace Indigenous ways of knowing and being—the more that canon appropriates Indigeneity and uses it against Indigenous peoples. Let me provide an example. More and more there is an understanding of the central importance and value of relationships within Indigenous communities; yet, frequently Indigenous scholars, students, and Elders are asked to do extra emotional and/or cultural labor for the institution to help “build good relationships” only to have it later used against them. This occurs when an Indigenous undergraduate student, who has been a leader in student-led initiatives is then penalized because they are taking too long to graduate, losing access to funding, housing, and other resources. It happens when Indigenous scholars who are under review for tenure and promotion are told they have done too much service even though this was the service they were asked to do on behalf of their institution. It also happens when Elders who speak from a place of wisdom and truth at public institutional events are then all of a sudden not invited back because they challenged the conception of what it means to be a “gentle Elder”. These examples are subversive acts of ongoing settler colonialism-infringing on what might be seen as cultural responsibilities that are then used against Indigenous peoples because we fail the Western colonially imposed and defined metrics of what it means to be “a good Indian.”

We can also see the ongoing colonial attempts at genocide and assimilation in the perpetuation of the view of homogeneity of Indigenous peoples that sees “sameness” to breakdown cultural and linguistic differences that have been deeply shaped by the lands and waters of their traditional territories. This is another example of the politics of distraction (Smith, 1997) as such homogenizing rhetoric requires Indigenous peoples alongside their allies to be hyper-vigilant of the colonial gaze and reminding the “others” (i.e., those who impose colonial views/biases) of the true diversity of Indigenous people. Being in good relations means coming to a deep understanding of the richness and diversity of Canada’s first peoples—even with the terms First Nations, Métis, and Inuit—we lose the uniqueness of the over 60 different Nations across this country—each of whom are defined by cultural protocols and understandings of relationship with lands and waters of their homelands. The lessons emerging from the lands, water, and air is what sets us in good relationships with the animate and inanimate. The relationship with our environment—whether mountain ranges, rugged coast lines, or the expanse of the tundra—inform our cultural knowledge, languages, and practices. As such, many Indigenous peoples believe everything is interconnected (Battiste, 2000; Mika, 2017). This interconnection is what colonization has attempted to erase.

It is such deep beliefs in the interconnection of all things that is offered through an Indigenous transformation of the educational system. The embodied Western knowledge and values of individualism and competitiveness becomes challenged by Indigenous

values of collectivism and community. The tensions between bringing Indigenous ways of knowing and being into the academy have been well discussed by others. However, in making visible the invisible means that we are also then able to also enact change. As I write this, I pause and think of black queer feminist, Audre Lorde, whose voice still rings true with her essay “the Master’s tools will never dismantle the Master’s house” (Lorde, 1984). The tools of colonization and genocide built the system we have today and calls for decolonization intentionally identify those tools for their true purpose—assimilation, genocide, erasure. What I attempt to offer here is another way of thinking about dismantling the masters house (e.g., education) through using Indigenous “tools” that empower an ongoing and iterative anti-colonial and transformational process. Can we dismantle the masters house with different tools, that is, Indigenous ways of knowing and being? Within the context of higher education—this means honoring the diversity of Indigenous epistemologies, ontologies, and axiologies and ensuring these deep knowledge systems are guiding the transformation through values and cultural principles may influence systemic transformation through decolonization means shifting institutional values from individual achievement and attainment to collective achievement and attainment. The short answer is “yes”—but it’s a long path to such changes, therefore, we must see this system change as iterative as the visions of Indigenous education futures are still in the dreaming, story making, and becoming phases. We are in the middle of the seventh generation preparing the system change needed to support the next 7 generations. This futurity of Indigenous education is the transformation process—the enacting and doing things Indigenously.

Seeing the possible through individual and collective actions

How do we “undo” colonization? It’s a deep energy that has tentacles across so many aspects of our lives. Yet, we also have a deepened consciousness of these tentacles and an understanding that colonialism has not gone away—these tentacles are much more visible, identifiable, and can be decolonized while we enact more anti-colonial practices. In these moments, we see how Indigenous peoples reclaim and enact Indigenous resurgence by taking back land, waters, and air to ensure Indigenous ways of being, knowing, and doing not only exist, but thrive. The question we need to be asking of ourselves as human beings on this fragile planet is “in whose interests does this work”? In many ways the other contributors to this volume, supported by research, attest that the educational system is failing many of us while further perpetuating broader social inequities. As Marie Battiste (2013) reminds us taking on this work

any attempt to decolonize education and actively resist colonial paradigms is a complex and daunting task. Educators must reject colonial curricula that offer students a fragmented and distorted picture of Indigenous peoples, and offer students a critical perspective of the historical context that created that fragmentation. In order to effect change, educators must help students understand the Eurocentric assumptions of superiority within the context of history and to recognize the continued dominance of these assumptions in all forms of contemporary knowledge” (p. 186).

Battiste (2013) was speaking to K-12 education system, I firmly believe it also applicable to all of us within post-secondary education—whether administrator, staff, faculty, instructor, or student. Consequently, the transformation of Indigenous higher education is about unveiling the hidden aspects of settler colonialism that go beyond the discussions and naming of anti-Indigenous racism—to ones that speak to ongoing enactment of settler colonization through systemic exclusion. As Gaudry and Lorde (2018) speak to the continuum of Indigenization, they acknowledge while institutional administrators are focusing on Indigenization inclusion (e.g., increasing Indigenous student, faculty, and staff) they acknowledge that Indigenous peoples are aiming for decolonial Indigenization which “envision[s] a wholesale overhaul of the academy to fundamentally reorient knowledge production based on balanced power relations between Indigenous peoples and Canadians, transforming the academy into something dynamic and new” (p. 226). System transformation is possible, but it is a long game thinking forward to the next seven generations. Stories of those who created the pathways in the 1960s and 1970s demonstrate that institutional change is possible, and with institutional change there is system change. From your own context you can probably identify who those Indigenous trail blazers were. In Canada, as part of Native Indian Brotherhood (now known as Assembly of First Nations), Verna Kirkness and others set the path for Indigenous programs (e.g., Native Teacher Education), and ultimately Indigenous student services in public post-secondary education (Pidgeon, 2005, 2014, 2016b; Stonechild, 2006).

Such individuals formed community around a shared vision (e.g., Indian Control over Indian Education, 1972), which then influenced educational systems across the provinces and territories and directly impacted national policies related to education (Carr-Stewart, 2019). Indigenous institutes of adult and higher education (e.g., Nicola Valley Institute of Technology (NVIT) (BC), Blue Quills College (SK)) were created to center and uphold Indigenous ways of knowing, being, and doing –by setting their own priorities and developing critical pathways of access to and for Indigenous learners. Furthermore, professional organizations, such as Indigenous Adult and Higher Learning Association (IAHLA <https://iahla.ca>) in BC and the National Associate of Indigenous Institutes of Higher Learning (https://www.afn.ca/uploads/files/2016_education_forum/session_5_-_post-secondary_education.pdf), are key advocates and voice for Indigenous community-based education.

Policies as good relations

In Canada, higher education is a provincial responsibility; however, Indigenous K-12 education is a legislated federal responsibility. The federal government sees post-secondary as a social obligation not a legal one (Stonechild, 2006). This relationship is set out in the Indian Act, which is a clear example of how well policy designed to eradicate Indigenous peoples from their lands, languages, and cultures can continue to influence society today (Battiste and Barman, 1995; Carr-Stewart, 2019, 2001; Fisher et al., 2006; Royal Commission on Aboriginal Peoples, 1996). For example, under the Indian Act, First Nations who pursued post-secondary education were enfranchised (i.e., lost their status as Indigenous peoples) until 1955 (Stonechild, 2006). It is no surprise that post-secondary education has not always been hospitable to Indigenous peoples—and the disparity of participation between Settler and Indigenous peoples in Canada continues to demonstrate the inequities across educational attainments.

While colonial policies have disrupted Indigenous education; it is also important to recognize the impact and influence how position papers and policies (e.g., National Indian Brotherhood, 1972; Royal Commission on Aboriginal Peoples, 1996; Truth and Reconciliation Commission of Canada (TRC), 2015), along with the international United Nations Declaration of the Rights of Indigenous Peoples (UNDRIP) (United Nations, 2007) are now shifting Canadian higher education to step into the work of living better relationships. What is evident from reading these documents is the consistent vision and calls for systemic change of Indigenous education by and for Indigenous peoples that connects lands, languages, cultural practices, and Indigenous knowledges as the foundation for Indigenous education (Hare and Davidson, 2020). The impact of the TRC (2015) report in particular has taken up calling on Canadians to embrace their responsibilities for learning the truth and being agents of change at the individual, community, and national levels regarding reconciliation.

Policy therefore can be a tool of decolonization and transformation, particularly at an institutional-level where local context and actors can enact change within their college or university, and become “good practice”, influencing others to follow suit. Within higher education, policies that support access, transition, and persistence through the PSE are a critical enactment of transformation. This is particularly relevant to supporting Indigenous student success—wholistically supporting their success means going beyond academic programs (i.e., individual intellectual needs) but also ensuring that the community supports (?) their emotional, cultural, and physical needs in culturally-relevant ways. In 2017–2019, my research team and I as part of a larger project to support Indigenous pathways to and through university undertook a national examination of institutional policies in this regard as a way of documenting how public universities in Canada were supporting Indigenous access, transition, and persistence to postsecondary education (Pidgeon et al., 2019). In this policy review, we noted that 80% of universities (N = 74) had institutional-specific awards and bursaries for Indigenous students. Additionally, many institutions connected Indigenous students to external awards (e.g., Indspire). These policies, however, remain couched in a colonial narrative. While over 50% of universities had Indigenous admissions policies, fewer institutions (13%) had specific housing policies for Indigenous students, or offered targeted on-campus family housing. In a deeper review of these policies—the tensions of how students self-identified (particularly for financial support) varied, from proof of status, to garnering letters of support from their communities or others who could verify who they were, to open self-declaration. The housing policies were of interest given that many First Nations, Métis, and Inuit students have to leave their home communities to attend university, yet policies focused on single occupancy and few offered family housing specific to Indigenous students. This means that those Indigenous students who are also parents—whether at the undergraduate or graduate—are left to find accommodations off-campus on their own.

Programs in good relations

The province of British Columbia committed to upholding the principles of UNDRIP through formal policy of Declaration on the Rights of Indigenous Peoples Act (DRIPA) on November 28, 2019 (DRIPA: <https://www2.gov.bc.ca/gov/content/governments/indigenous-people/new-relationship/united-nations-declaration-on-the-rights-of-indigenous-peoples>). While many public BC post-secondary institutions were already working to respond to the TRC (2015) calls to action, they now have further impetus to further their commitments to reconciliation via institutional plans and strategic documents, which ultimately guides (and shifts) institutional policies and practices. Such institutional responses to the TRC Calls to Action are evident across the country. However, it is also important to remember that transformation in the academy began well before 2015.

Academic change is a long process and began with those trail-blazers of the 1950s and continues with those who followed them. We can certainly identify where growth is happening— and yet, we also see the huge gaps and pitfalls that still lie in the way of advancing Indigenous control over Indigenous education, or even how the 4Rs of respect, relevance, responsibility, and reciprocity have been taken up (Kirkness and Barnhardt, 1991; Marker, 2004). A period of growth in the 1970s occurred with the establishment of Native Teacher Education and Indigenous Studies (e.g., formerly Native Studies) programs. This expansion of Indigenous specific programs, courses, and specializations continued in the late 1990s to present day (e.g., Geography, Linguistics, Forestry, Social Work, Health Sciences, STEAM), while reserved seating and culturally relevant programming (e.g., Law, Medicine, Nursing) have expanded Indigenous access to relevant academic programming and services. These changes are the result of the visions of our ancestors being enacted into being—yet there is still much to be done within the classrooms if we truly want to be more inclusive of Indigenous ways of knowing and being. Changes are still needed, from the curriculum and pedagogical practices to the classroom experiences of Indigenous learners.

However, the post-secondary experience is not just about the in-class experiences for Indigenous students, it is also about how their student experience outside of the classroom is supported and the systemic racism that exists on our campuses both within and outside of the classroom, is addressed. Early on in the 1970s it was recognized that due to the systemic and educational barriers facing them, Indigenous students needed to have wholistic supports in place when entering into post-secondary education. This awareness led to the establishment of Indigenous student services during the time of the first cohorts of Indigenous teacher education students (Pidgeon, 2016b). Between 2018 and 2019, my research team conducted a national study on Indigenous access, transition, and persistence programming—in which we identified that 95% of the 74 public universities in Canada offer culturally-relevant support services through Indigenous student services. This is notable growth—in 2001 I reviewed these same institutions and found only 49% provided some form of Indigenous student services (Pidgeon et al., 2019). Indigenous student services is the “home away from home” for many First Nations, Métis, and Inuit students along with Indigenous students from the United States, Australia, and elsewhere who choose to study in Canada. These culturally-relevant support services offered to meet the needs of the whole student tend to students’ physical, emotional, cultural, and spiritual needs (Shotton et al., 2013; Waterman et al., 2018). The Centers provide in essence sanctuary of being “Indigenous” and offer students a break from being “othered” across the campus.

In reviewing how Canadian public universities supported Indigenous students, we found that most (69%) focused on support programming for the transition of Indigenous students into their institutions (e.g., programming focusing on the first-year experience). About half provided some form of access programming (e.g., summer camps for K-12 students), but only 27% offer retention programs that support the persistence of Indigenous students beyond the second year of study (Pidgeon et al., 2019, p. 37). Even fewer universities (N = 8) supported Indigenous-focused co-op or experiential programs. For example, the University of Calgary provides an Indigenous Co-op Program that administers one-on-one dedicated support with an Indigenous career specialist. Carleton University promises its graduates the opportunity to be equipped to work in their band councils, community organizations, and the federal civil service in Ottawa (Pidgeon et al., 2019, p. 37). Having programs—whether academic or student services—is an important step to supporting Indigenous student success and transforming their university experiences both within and outside the classroom. However, it is also evident that programming alone or financial supports alone is not enough—there is an interconnection between wholistically supporting students and system transformation that is critical- and that directly relates to the people (and their practices).

The challenge to also note here is that these culturally-relevant services must continue to operate within an ongoing systemic colonial policies and procedures that continue to push back on how Indigenous programming and services are provided within the institution. For example, central financial office pushing-back on processing payments to knowledge holders due to lack of information (despite forms being fully completed). Another is students failing academic papers when citing Elder’s teachings in their paper. The stories I’ve heard continue to attest that while more programming and services exist there is an ongoing surveillance over these initiatives constraining how “Indigenous” ways of doing the work is limited. Within postsecondary institutions, the enactment of policies and development of culturally relevant academic programs and support services would not be possible without people practicing good relations.

People and practices in good relations

In Canada, as elsewhere, there is a recognition that Indigenous education transformation means having Indigenous peoples at every level of the institution. Being the seen face matters both in role modeling good practices, and establishing good relationships; but Indigenous ways of being and doing are going to be different and challenge Western-construed understandings of leadership. Elsewhere I’ve written about this in more detail (Pidgeon, 2008, 2014, 2016a) but reflecting on the importance of having the good people walking in this work, those who are focused on the collective vision of what is needed to support Indigenous higher education, I fully recognize that the policies and programs in place were built by people—Indigenous and others who walked alongside them—to do something meaningful, to enact change for the better for Indigenous students and their communities. Indigenous programming, policies, and services were built by those committed to calling out injustices, systemic racism, and pushing boundaries of what counted as knowledge, learning, and being in the academy. This relational way of being within the academy reminds me of the vision set out within *Indian Control over Indian Education*, where Indigenous peoples have meaningful representation, presence, voice, and leadership across the institution.

Indian people should seek representation on the governing bodies of institutions of higher learning. This includes university senates and boards of governors, as well as the governing councils of colleges, community colleges and technical schools.

National Indian Brotherhood (1972, pp. 13–14).

I recognize that this relationship between Indigenous peoples and post-secondary institutions is still largely one-way—grassroots change implemented by a core group of committed individuals pushing against the system. The question I am left with is how much of this collective change will lead to institutional transformation—the power structures that continue to privilege the western canon give way to value Indigenous ways of doing and being. Therefore, being in good relations means that we must also recognize the hidden tentacles of colonization that exists in our institutions—the overt and covert forms of anti-Indigenous racism that continues

to negatively impact, impede, or intentionally disrupt and distract those committed to institutional transformation. Some examples of that I see enacted are the questioning of “why are Indigenous peoples being treated special” and the systematic exclusion of Indigenous students from programs and opportunities because of mis-held beliefs that Indigenous students are “not academically ready” for post-secondary education. Within policy, it’s exemplified with the changes of tenure and promotion criteria to be inclusive of Indigenous research approaches and knowledge mobilization but the people interpreting these policies continue to value individual peer-reviewed publications in top tier journals and individual grant attainment.

Patel (2021) points to how Indigenous students and faculty, along with other BIPOC, are coveted for institutional promotional materials and communication. The optics of visual diversity, and the instances of “visible” Indigenous culture (i.e., wearing of traditional regalia during graduation, holding drums or feathers) and how these students “are disproportionately asked to provide input and even leadership on committees and task forces results in their identity being “... treated in a sense as commodities” (p. 39). Of course, having Indigenous students at various committees and decision-making tables is important, Patel (2021) doesn’t dispute that. However, what she does point out and I have witnessed over and over within the Canadian post-secondary system, is the extractive nature of these engagements, with institutions simply taking knowledge and wisdom from students as uncompensated labor. Such leadership opportunities. While potentially valuable, more often than not tend to distract students from the opportunity to focus on being a university or college student—to study and learn. Albeit they are definitely getting an applied education in systemic settler colonialism and the ways their presence can be tokenizing and homogenizing all at the same time. The costs are emotional, physical, intellectual, and spiritual—and we see more Indigenous students taking a break from their studies to recover from burn out due to their leadership activities on campus. This is particularly evident when their voices are raised—the colonists around the room may nod in agreement to the “articulate way” Indigenous students passionately speak to a concern, yet continue to respond with silence and, most hurtfully, a firm lack of action.

Transforming Indigenous education through good relations

Systemic and societal change is possible—there are examples of program and policy change that show how systemic and structural change has been occurring within the vision of Indigenous education. However, being mindful of whose story is being told (or not told) requires Indigenous peoples and those allies working alongside us in this work to sustain systemic change, in addition to advancing the vision through sheer determination and persistence. As broader societal movements and calls for change (e.g., #metoo, #BLM, #LandBack, #reconciliation, #decolonization) resound throughout our post-secondary campuses, hallways, and classrooms, we must see the opportunity to disrupt settler colonialism. In these movements and calls for change, I think about the Indigenous students, staff, and faculty who are instigating change—calling on transformation so the next generation of Indigenous peoples who come to our institutions do not have to encounter resistance and racism to who they are as Indigenous peoples. As Leigh Patel (2021) also recounts how settler colonialism is enacted in her work, I also want to clearly name and identify the politics of distraction that exists and the necessity of being hypervigilant to what is happening both institutionally and within society, responding to incidents of racism, ensuring Indigenous voices are at decision making tables, on hiring committees, supporting students, advancing policies, interrupting colonial practices, and the list goes on. This largely less-valued work continues on-top of my day-to-day contractual (?) duties and responsibilities. These are just a few colonial tactics at play that result in real burnout and lateral violence against Indigenous peoples and their allies who work to disrupt and transform systems within ongoing colonialism.

At times, one may even question if one can be in good relations in ongoing settler colonialism? That is the crux of the issue at hand in Canadian higher education, a system built upon the values of settler colonialism-displacement of Indigenous peoples from their lands and ways of being in the name of individuality, profit, land ownership, and resource extraction. At times, I feel overwhelmed by the responsibilities placed on Indigenous peoples in the academy to transform an unengaged and resistant colonial institution. It is relentless work, and even as a tenured professor, the costs of the work weigh on my physical, emotional, and spiritual well-being which leaves little energy to do the intellectual work that is my heart work. Yet, in these moments of frustration, anger, and resignation, I think of those who have gone before me to chart a path of Indigenous education by and for Indigenous peoples and then I think of those who are yet to come—and wanting them to have an educational experience that enriches their entire being and supports the development of their gifts in the ways that honor who they are as Indigenous peoples. I think of the inherent obligations and responsibilities that are part of our work of being in these places and the intergenerational mentoring that occurs when the next generation of students is supported by those who have come before them. I see the hope along with the pain of system change—it is the hope and the willingness to preserve knowing it isn’t about just one person—but a peoples, generations of families and communities that need us to do better by and for them. This passion ignites the words you read here, and my passions ultimately guide my thinking to the practicality of what we need to do to enact transformation through the interconnectedness of relationships and the whole being (emotional, physical, intellectual, and spiritual).

If we were to see the interconnectedness of all the changes needed for transformation, a few aspects that matter within post-secondary education become apparent: *Representation, Authority, Voice, and Resources* to have Indigenous representation across all aspects of the institution and *Indigenous-informed policies and practices* that align with Indigenous ways of knowing, being and doing, so whether it’s processing financial payment, whether it’s admission criteria, whether it’s graduation criteria, language requirements, all those parts, you need to have wholistic practices that align with supporting Indigeneity across the institution. This is across our governance structures, academic programs and student services, curriculum and pedagogical practices, and research, including

knowledge mobilization. From these elements of transformation we need to ask ourselves: How do we shift the way we do it to actually impact the mindsets, some would call their hearts, of the people and then their practices? Fundamentally-it comes down to building and sustaining good relations. Some of this system change has to begin with the people because you have to be able to shift their mindsets, practices, and what is valued to be able to then have them take up the work of not only interpreting policies but also rewriting policies. Being in good relations with people also connects to representation- "nothing about us without us" means ensuring Indigenous representation across the institution from senior leadership to the students and at every governance table within the institution. Post-secondary institutions need individuals on the ground willing to do the program development and delivery and they also need those who are on the ground doing the curriculum development along with those who are addressing system wide policies that support Indigenous education and relationships with the Indigenous peoples whose traditional territories the institutions reside upon.

In finishing these words, I remain hopeful that my being in good relations with post-secondary institutions will eventually develop a reciprocity where the institution in turn accepts the responsibility to be in good relations with me. That recognizing the work of changing the whole system involves all of us and then figuring out which pieces we connect to, and where we can help support, change, transform, or even dismantle. The 4Rs, respect, relevance, reciprocity, and responsibility, are then supported by the actionable 4Ps—people, policies, programs and practices. Being in good relations within your place, within your context, means knowing who your people are and seeing systemic change as intentional capacity building supporting intergenerational mentoring to fully realize good relations (e.g., who's coming up behind you that you need to be mentoring and encouraging and supporting).

I noted at the outset that as the reader- whether settler or Indigenous—you were being asked to actively reflect and consider your own actions and commitments to transforming Indigenous education both individually and as part of a collective community. I cannot tell you what it means to be in good relations in these efforts because it is up to you to live your own relations. Yet I leave you here with the questions to guide your own learning: What have you done to decolonize the institutions where you live, work and learn? What can you do to live in good relations with your Indigenous colleagues and the Indigenous communities within and outside your institution?

Introduction

In Bennett's 1988 artwork, *Echo and Narcissus* (McLean and Bennett, 1996), Narcissus, a white fetal-like figure devoid of defining features, peers into a reflective pool of water out of which Echo, an Aboriginal man emerges caressing Narcissus' face. *Echo and Narcissus* provides an insightful metaphor for some of the challenges relating to reconciliation and truth-telling in colonized Australia; asking, what is reflected when the white colonizer inspects themselves while on Indigenous sovereign land?

In this chapter, we take the university as akin to Narcissus in that it is an institution that mirrors white Anglo-centric ontologies, epistemologies, and power structures. When Aboriginal and Torres Strait Islander people gaze into the mirror that reflects the university, they rarely see echoes of themselves. Negative and racist experiences within the university system—or a failure to provide adequate support networks—can harbor feelings of alienation or dispossession, making universities unwelcoming places for many Aboriginal and Torres Strait Islander staff, students, and visitors (Fredericks, 2020). Here, we discuss how some Indigenous people have difficulty in seeing themselves in the social and built environment in Australian universities impacting enrollment, retention, and completion rates. We argue that to improve educational outcomes for Indigenous peoples; the staff, policies, and resources that govern behaviors and strategic decisions must reflect Aboriginal and Torres Strait Islander perspectives.

Enrollment of Aboriginal and Torres Strait Islander students within Australian universities have doubled since 2008 (Fredericks et al., 2022). This, however, remains varied with some universities achieving better results compared to others. Enrollment numbers remain disparate vis-a-vis the non-Indigenous population with enrollments of Aboriginal and Torres Straits Islander peoples in domestic bachelor courses comprising just 0.74% of the entire cohort (Fredericks et al., 2022). The Review of Higher Education Access and Outcomes for Aboriginal and Torres Strait Islander People: Final Report (Behrendt et al., 2012) highlights the need to shift away from a focus on access toward successful educational outcomes for Indigenous students and to identify what strategies universities with consistently high success rates employ. Further, a report funded by the National Center for Student Equity in Higher Education (NCSEHE) and led by scholars at the University of Queensland (Fredericks et al., 2022), has demonstrated that while completion rates of Indigenous students in higher education continues to lag national trends, institutions with Indigenous-led support centers, which are targeted toward and led by Indigenous peoples, are outperforming those that do not have them.

Universities Australia's *Indigenous Strategy for 2022–2025* (Universities Australia, 2022) highlights that access is not as a major priority as it once was—although access, especially in regional areas, persists as a barrier in need of redress—but rather argues that focus should turn toward retention and completion rates. As of 2019, completion rates among Indigenous students who graduated within 9 years of their undergraduate degree stands at 47% (Universities Australia, 2022: 24). This is a slight improvement from previous years but falls significantly short of reaching parity with the national cohort who have a completion rate of 74%. This raises questions such as, (1) what factors are contributing toward Indigenous students' decision to discontinue their studies; and (2) would completion rates improve if these barriers are identified and redressed within the university system?

To unpack these questions, we drawn on a recent report (Fredericks et al., 2022) which involved 66 qualitative interviews conducted across five Australian universities with Indigenous staff, enrolled students, and students who had discontinued their studies. The study's aim was to quantify data to provide evidence upon which greater understandings of the factors that impact completion and retention rates could be gained. It presents data that contributes to the development of effective strategies aiming to help Aboriginal and Torres Strait Islander peoples achieve greater academic success.

To inform our discussion of the direction higher education policy is currently heading, we also consider the policy framework outlined in Universities Australia's *Indigenous Strategy for 2022–2025*. Universities Australia is the peak body for Australian universities, representing 39 institutions nationwide. Their Indigenous Strategy outlines existing trends, identifies the areas in need of improvement, and reinforces a commitment to making the structural changes necessary to improve educational outcomes. We

finally draw on research conducted during the development of The University of Queensland’s *Aboriginal and Torres Strait Islander Design Framework Engagement Report* (Go-Sam et al., 2021). This qualitative research documents the views Aboriginal and Torres Strait Islander students and staff have toward the built-environment and infrastructure on the “sandstone” university campus.

These documents—along with a growing body of literature on critical race theory and place—are collectively encouraging a dialog around creating a university environment that is equally representative and welcoming of Indigenous peoples.

Universities, whiteness and racism

Universities are socially constructed institutions that reflect and produce social realities and hierarchies that are predominantly based on western Anglo-centric outlooks (Foley et al., 2015; Fredericks, 2020; Fredericks et al., 2019b; Nakata et al., 2019). As sites of knowledge production, universities play critical roles in the reclamation and re-territorialization of place as a “white possession” (Fredericks, 2009; Moreton-Robinson, 2007, 2021; Stewart et al., 2021). In other words, universities are sites where notions of *terra nullius*—the legal fiction that claimed the land we now know as Australia as “uninhabited”—are reinforced via its buildings, landscaping, systems of governance, placenames, and monuments that attempt to erase Indigenous cultures and presence (Butler, 2000; Fredericks, 2020; Watson, 2014).

In colonized spaces where white sovereignty is continuously reiterated as a means to take and retain power, Indigenous peoples are often characterized as an “unsettling presence” (Fredericks, 2020; Fredericks et al., 2019a; Kinnane et al., 2014; Williamson and Dalal, 2007). When Aboriginal and Torres Strait Islander people make their presence known by occupying senior positions or working in ways that align with Indigenous cultural protocols, it can expose the pervasiveness of white possession, the falsity of white sovereignty, and expose the ongoing impact of colonialism (Hokowhitu et al., 2020; Moreton-Robinson, 2015, 2021; Gunstone, 2009). The disregard of Indigenous cultures and perspectives—as well as decisions to challenge and resist to the status quo (Nakata, 2013)—can make the university a culturally unsafe environment for many Aboriginal and Torres Strait Islander people. In some regards, the university is a place where Indigenous peoples are treated as anomalies while on their own Country/Land or the countries/lands of other Indigenous peoples (Best, 2018; Fredericks, 2020; Moreton-Robinson, 2015; Newton, 2021). Fredericks (2020: para 7) has written on how,

Everything linked to the university, including its iconography, selection and display of artworks, photographic imagery used in marketing materials, and events held in and around the sandstone buildings, are evidence of their Anglo-centrality. The very buildings communicate cultural dominance. Cultural dominance is also communicated through the university’s physical infrastructure, systems, structures, budget allocations, and everyday interactions.

Indigenous peoples are unable to see themselves in the surrounding environment as their perspectives are rarely considered first or taken as the point of departure. Indigenous outlooks therefore need to be built into and flow through the strategies, policies, curricula, and built environment that make up a university. They must become places that reflect the Indigenous cultures and lands upon which they stand (Bunda et al., 2012). To achieve this however, the structural and institutional racism that is reflected and produced by universities needs to be confronted head-on.

Racism and discrimination toward Aboriginal and Torres Strait Islander peoples within the university significantly hinders Indigenous people’s ability to see themselves and develop a sense of belonging within the institution (Bunda, 2017a,b; Bunda et al., 2019; Uink et al., 2022). Acts that deny, disregard, or dismiss Indigenous presence communicate that they are spaces in which Indigenous peoples are neither welcomed nor seen to naturally belong (Leroy-Dyer and Heckenberg, 2022). Within higher education, 75% of Indigenous staff have experienced racism in the workplace (Universities Australia, 2022: 46) while experiences of racism by students are highly reported (Brown and Shay, 2021; Plater et al., 2020; Taylor et al., 2019). This suggests that racism is a systemic problem and deeply engrained.

Indigenous students and staffs’ ability to navigate, succeed, or be promoted within a university is often predicated on their capacity to *fit in* with the expectations and pedagogies of the overwhelmingly white institution (Bargallie, 2020; Bunda, 2014; Moreton-Robinson, 2020). Aboriginal and Torres Strait Islander peoples may not always see the university as a reflection of themselves, but they are expected to act as if it were. Racist experiences with staff, lecturers, tutors, and feelings of being unable to address concerns within a safe environment contribute to retention and completion rates (Fredericks et al., 2022). Dominant western pedagogies and epistemologies, for example, often conflict with Indigenous outlooks. Lecturers and/or tutors fail to consider how their positionality may be contested by others (Moreton-Robinson, 2020; Rigney, 1999, 2006; Fredericks et al., 2022; Nakata, 2011).

Creating Indigenous visibility within the university, however, entails more than tokenistic gestures or lumping Indigenous content into a single week. In some cases, Indigenous students can feel uncomfortable with being singled out or treated as “experts” who are expected to speak for all Indigenous peoples (Fredericks et al., 2022). These classes fail to recognize the diversity of Indigenous knowledge and cultures and the many ways in which people engage their Indigeneity (Sarra, 2014; Nakata, 2012; Waters, 2017). The lecture theater or tutorial room can quickly turn into an accusatory, voyeuristic, and culturally unsafe space in which micro-aggressions and blatant racism play out, while Anglo-centric dominance is reinforced and goes uncontested (Brown, 2010).

Decisions to make one’s Indigenous presence visible by pushing back or “talkin-up” to the system can be a daunting prospect, especially when an Indigenous person is in the minority or are the only Aboriginal or Torres Strait Islander person in the room

(Moreton-Robinson, 2020; Bargallie, 2020). Contesting the status quo within the university or challenging dominant structures can have significant ramifications on education, career pathways, and the prospect of attaining promotions and senior positions (Bargallie, 2020; Cassells et al., 2022; Coates et al., 2022a; Tamer, 2022; Trudgett et al., 2017). The risk and toll of raising concerns of structural racism to personnel who are understanding and responsive to colonial contexts is perhaps a product of a lack of Indigenous representation at senior and executive levels.

Having senior leadership will encourage top-down reform, rather than placing the burden on Indigenous staff and support centers. University Australia’s Indigenous Strategy has committed to addressing racism within the university sector, advising universities to take a zero-tolerance stance. Strategies include creating more leadership and senior positions for Indigenous peoples while confronting institutions’ complicity in maintaining systemic barriers and racial prejudice. This means that institutions and the executive teams and boards that determine universities’ strategies and policies need to remain receptive to the prospect of being challenged and recognize the history and ongoing impact of colonization (Foley et al., 2015, 2019). When Indigenous staff and students raise concerns of racism or propose pedagogies or methodologies that may not align with western outlooks, the visibility of senior staff is essential as it communicates that the institution values and takes Indigenous perspectives seriously.

Senior Indigenous positions also need to flow into other roles, either sideways, or upwards. Indigenous people within Indigenous positions can become stuck within a systemic racialized structure that blocks them from any further career development or promotion. Universities which do not address these structural biases are thus ensuring they will never have an Indigenous person who is a Senior Executive or Vice-Chancellor who has progressed via the Indigenous leadership positions (see Coates et al., 2022b for more discussion).

In addition to experiencing overt forms of racism within universities, Aboriginal and Torres Strait Islander people often have the burden having to explain and justify their actions or socio-cultural circumstances to non-Indigenous staff. For example, asking for time off or extensions for cultural reasons like mortuary rites, known as “sorry business”. This is not only emotionally draining but can cause discomfort, alienation, and in some circumstances resurface trauma (Grieve-Williams, 2008). The inability to feel safe, welcomed, or represented within governing structures means that some students avoid accessing support from non-Indigenous staff due to the lack of understanding they receive and the discomfort of having to explain and teach non-Indigenous staff on topics relating to Indigenous cultures. This can hinder a student’s education, affect their grades, or contribute to a student’s decision to discontinue their studies.

It is widely argued that cultural competency training and increasing cultural awareness among non-Indigenous peoples can improve outcomes for Indigenous staff and students (Fredericks and Bargallie, 2016, 2020a,b). More universities have cultural competency training and have taken steps to alleviate some of burdens placed on Indigenous staff to correct or withstand culturally inappropriate behavior within the institution (Universities Australia, 2020). It is unrealistic, however, to believe that the policies and structures that inform the negative experiences of Aboriginal and Torres Strait Islander peoples will be undone via the implementation of cultural training or Reconciliation Action Plans alone. We recognize that if not done correctly, cultural competency can become a colonizing tool through which non-Indigenous peoples aim to “manage” Indigenous peoples within the institution. It can have the adverse effect of empowering non-Indigenous peoples with the misguided perception that they can create change through understanding alone, while not addressing systemic racism or opening new opportunities and positions for Aboriginal and Torres Strait Islander staff.

Having said that, initiating difficult conversations can improve racial literacy and generate greater awareness and accountability (Bargallie, 2020; Brown et al., 2021; Fredericks and Bradfield, 2021a). Effective cultural competency should be informed by “critical race theory” which is a framework that seeks to unpack race as a determining factor of the ways in which the world is organized and responded (Bargallie, 2020; Delgado and Stefancic, 2017; McLaughlin and Whatman, 2011). Becoming “competent” in another’s culture, requires more than simply learning about a so-called “exotic other” within a de-politicized space (Kowal, 2010). It necessitates a deeper engagement with ongoing power structures and asks participants to reflect on the behaviors and policies that prevent them from understanding and recognizing Indigenous perspectives and sovereignties (Fredericks and Bargallie, 2016; Morrison et al., 2019). Where Indigenous people struggle to be seen within the university system, non-Indigenous peoples (and the structures they govern) often fail to see themselves in an open and honest way, veiling how their actions are the products and beneficiaries of colonial structures that privilege and reward Eurocentric outlooks (Bargallie, 2020; Gillborn, 2015; Moreton-Robinson, 1998).

In their evaluation of a cultural competency pilot program in central Queensland, Fredericks and Bargallie (2020a) challenge the “myth of safe space” within cultural competency frameworks. They argue that while courses should not be accusatory or aggressive, they must recognize that “safety” often correlates with dominant white groups avoiding uncomfortable topics and refusing to do the “hard work” of dismantling racism. Exposing what DiAngelo (2022) terms “white fragility”, dialogs about race that are facilitated and dominated by white voices can result in defensiveness that reinforces Eurocentric supremacy. Topics are avoided or watered down under the guise of creating a “safe space” in which the discomfort of racism and one’s complicity and profiting from it are negated (Anderson and Riley, 2021). Cultural competency training with non-Indigenous peoples should recognize that comfort within settler spaces cannot be assured; that discomfort and a lack of safety is something Indigenous peoples live with daily; and that discomfort is part of the learning process (Bond, 2014).

Cultural competency therefore means holding a mirror that exposes the systemic and institutional racism that impacts retention and completion rates. It calls for greater consideration of how structures and systems within the university can shift in ways that enable Indigenous staff and students to see themselves in the surrounding environment and develop a sense of belonging. As we discuss in further detail below, relationality, lies central to such recognition.

Relationality and creating a sense of belonging

Creating a university environment in which Aboriginal and Torres Strait Islander people can see themselves requires frameworks that are flexible, informed, and responsive to Indigenous peoples’ lived experiences. Studies have shown that increasing the visibility of Indigenous peoples and cultures can help improve completion rates, the retention of staff, and lead to greater advancement/promotion to senior leadership roles. Acting as cultural hubs, Indigenous support centers have the staff and resources needed to help student’s liaise with university faculties and departments—assisting in the negotiation of deadlines, extensions, systems, and time management. In faculties, schools, and educational settings where Indigeneity is often shrouded, Indigenous support centers are creating visibility that challenges their denial.

The support, dedication, and services provided by these centers, however, must flow throughout all faculties and schools. Cultural competency training, as discussed above, can assist in educating non-Indigenous staff, tutors, and lecturers of some of the factors that shape how and the circumstances under which Indigenous peoples learn. This can create a sense of shared understanding that will become the basis of collectively working through challenges that may arise. Competency, however, must be backed up by capacity building and increasing the numbers of Indigenous staff.

A sense of belonging is also created by having systems that are flexible and understanding of the sociocultural and socioeconomic circumstances of Indigenous students. Recent research, for example, found that Indigenous peoples tend to take longer to complete their degree compared to non-Indigenous students (Fredericks et al., 2022; Universities Australia, 2020). There are numerous explanations for this, including balancing commitments to family, employment, or having to take time off for mental health, cultural business, or other sociocultural reasons. The prolonged time it takes to complete a degree, however, should not be seen as a negative reflection of a student’s academic progress.

While the greater time it takes to complete a degree may be an indicator of increased risk of dropout among non-Indigenous students, for Indigenous peoples it can be conducive to their educational journey providing it is backed with support, infrastructure, and resources. Completion rates for Indigenous students who completed their undergraduate degree within 5–6 years at universities that have Indigenous support centers, for example, exceed the rates of non-Indigenous students. Therefore, more needs to be done to assist and support students over the course of their entire study—regardless of how long it takes.

Family and relationality also remain significant drivers of completion rates for Indigenous peoples (Oliver et al., 2013; Roche-couste et al., 2017). Family can be sources of motivation but can also potentially impact retention rates, as family and cultural commitments takes precedence over study. Indigenous peoples are community-orientated and motivated by an awareness that one’s knowledge and skills are best placed when they are for the benefit and advancement of their families. Building strong relationships with staff, peers, and other communities can help students navigate the university while also improve completion rates (Milne et al., 2016).

The ability to see one’s family, alongside creating an environment that fosters relationality, can contribute to a sense of belonging that improves education outcomes and experiences for Aboriginal and Torres Strait Islander people. The Fredericks et al. (2022) report demonstrates that growing numbers of Aboriginal and Torres Strait Islander peoples are completing their degrees and encouraging members of their family to do the same. This is despite past trends the demonstrate that Indigenous students are often the first in their family to attend university (Barney, 2013; Oliver et al., 2013). Many of the students interviewed as part of the research drew inspiration from family and friends who studied before them (Fredericks et al., 2022).

In some cases, family members of different generations were studying at the same institution simultaneously. Indigenous peoples position themselves through their relationships with kin and ancestors who are embedded in place and within the memory of place. Universities are Indigenous places where memory and lived experiences reside. Having multiple generations of Aboriginal and Torres Strait Islander people study at an institution and building a strong cohort of alumni can assist in making the space familiar and representative of Indigenous knowledges, cultures, languages, and histories. This emphasizes the importance of memory, place, and the significance of sharing stories of achievements and challenges relating to university life.

The *Indigenous Strategy 2017–2020* (Universities Australia, 2017) highlights “building effective community partnerships” as one of its key priorities to improving outcomes within the university sector. This is vital as Aboriginal and Torres Strait Islander people see themselves through their relationships with and within community. The University of Queensland, as many other universities, has recognized this, building “Community Engagement and Involvement” into its 2021–2025 *Aboriginal and Torres Strait Islander Research and Innovation Strategy* (The University of Queensland, 2021). This component of the strategy seeks to establish a cross-disciplinary hub to create community partnerships and opportunities to fund and broaden innovative research projects.

Community engagement however must flow through the entire university experience from *outreach programs* where students are encouraged to enroll; within the university via *acknowledgments* to Country, cultural literacy training, and cultural events; within *curriculum* that positions education from Indigenous perspectives; and in *pathways* toward further education and careers. The University of Melbourne, for example, has created an innovative Indigenous pedagogy as part of its Indigenous Studies program, integrating community and place-based knowledges within its curriculum. Each lecture seeks to incorporate a traditional owner who conducts a masterclass on a place-paced topic. In addition to building links and connections to community, initiatives such as these are creating and archiving knowledges that are accessible to future students and communities—making Indigenous visibility a long-term commitment that will span generations.

Integrating traditional knowledges within curriculum does not only assure academic rigor—providing innovative insights across all disciplines—but rather places tertiary education within the learner’s lived experience (Shay and Oliver, 2021). Education becomes less removed from place or approached as a discipline where one casts their objective gaze upon a removed “other”

and is recognized as being inseparable to place and culture. Indigenous students are more likely to see themselves in the research and be motivated by how education can benefit themselves, their families, communities, and Country (Barney, 2013; Bunda, 2014; Fredericks et al., 2015; Pagnini et al., 2014).

Indigenous support centers and units create spaces in which staff and peers act as a “de-facto” family, helping each other navigate the challenges associated with higher education (Andersen et al., 2008; Pechenkina et al., 2011; Rochecouste et al., 2017; Uink et al., 2022). Uink et al. (2022, p. 40), notes that a number of the students they interviewed felt “that there was a community of people on campus who were there for support”. Indigenous peoples are already impacted by higher rates of socio-economic disadvantages compared to the non-Indigenous population, particularly in relation to finance, income, and affordability of food, rent, electricity, transportation, and computers and technology (Fredericks and Bradfield, 2021b; Lowitja Institute, 2021). This is further exacerbated for students who balance study with work, education, and family responsibilities.

Indigenous support centers alleviate some of these pressures. For example, to curb food insecurity, they often stock food that students may access while also providing spaces, resources, and kitchens. This provides students with a space of their own with designated areas where they can concentrate on their education; do not have to worry about accessing computers or photocopiers; have the additional support of tutors, peers, and mentors; and can socialize and unwind (Fredericks et al., 2022; Kinnane et al., 2014; Shalley et al., 2019).

Creating a welcoming environment is especially important for 1st year enrollments. Indigenous students who attend universities with established Indigenous support centers were more likely to return after their 1st year—going on to complete their degree within the given timeframe. While negative experiences may be a motivating factor for regional students to return home and discontinue their studies generally, universities with Indigenous support centers were able to overcome such barriers achieving greater retention rates due to the support it provided Indigenous students.

Scholarships and financial support for students also opens doors and creates opportunities that would otherwise obstruct Aboriginal and Torres Strait Islander people from accessing tertiary education. Offering emergency financial support, food baskets, and providing access to computers and internet during the pandemic were particularly crucial to supporting students, many of whom experienced heightened financial strain and other social pressures (Fredericks et al., 2021). The pandemic, along with the necessity to limit face-to-face interaction, significantly impacted relationships between and among Indigenous staff and students, placing retention at risk due to disruptions to support networks. Many Indigenous support staff made conscious efforts to bridge the challenges posed by the pandemic, continuing social events online to maintain connection and wellbeing, while increasing access to online tutoring and academic support. Creating visibility and a sense of belonging within universities, therefore, refers to having the support networks in place that assist students and have their interests at heart.

Although financial support alleviates some of the financial pressures associated with studying, Fredericks et al. (2022) found no direct correlation between the attainment of Commonwealth Scholarships and completion rates. This suggests that retention is more likely determined by the social and cultural make-up of a universities’ environment, rather than only financial constraints. While greater investment in scholarships opens the door to tertiary education, Indigenous support centers play critical roles in retaining students and providing a safe and conducive educational environment. Both are therefore vital and necessary.

Universities and funding bodies, however, must be willing to invest in the staff and resources needed to increase the reach of Indigenous support centers and infrastructure. As reported by Universities Australia, in some cases, government funding intended as supplementary top-ups for pre-existing Indigenous support centers and networks have been used to fund universities’ entire Indigenous engagement strategies (Universities Australia, 2022: 23). In some universities, the facilities which house Indigenous support centers are in complete contrast to the facilities which house the chancellor, or the engineering, business, or anthropology programs. This is despite university leadership, and councils/senates saying how much they value Indigenous peoples and cultures and the Reconciliation Action Plans they have developed. Welcoming and celebrating Indigenous visibility must translate to meaningful outcomes and be more than tokenistic lip-service.

Universities must be willing to invest adequate funds for appropriate facilities, and to build strong support networks run by Indigenous staff and students. More staff and resources are needed to meet increased demand and to avoid burnout (Barney, 2018). Although the number of Aboriginal and Torres Strait Islander staff has nationally doubled since 2005, it remains disproportionate to the entire Indigenous population. Where Universities Australia’s previous Indigenous Strategy (2017–2021) focused on establishing frameworks to initiate change, the new iteration centers on delivery and execution across the entire university system. A whole of university approach, with transparent and measurable targets, is needed so that processes can be evaluated, monitored and successful initiatives and strategies shared. Indigenous perspectives and targets should be built into the foundation of a universities’ ethos, included in its corporate plans, research strategies, procurement policies, design protocols, teaching and learning, and employment strategies.

Indigenous centers and units create culturally safe spaces for students that help build a sense of community and belonging among staff and peers which extend beyond notions of access and individual success. This commonality is shared with other Indigenous peoples in Canada (Cote-Meek, 2014; Battiste, 2013; Tanaka, 2016), the United States (Brayboy et al., 2012; Huaman and Brayboy, 2017; Waterman et al., 2018), and New Zealand (Bishop et al., 2010). It’s important that universities continue to provide or establish designated spaces for Aboriginal and Torres Strait Islander peoples. Their place within the university, or a student’s motivations for accessing them, however, should not come because of negative or racist experiences encountered on campus. In the Fredericks et al. report (2022), some students expressed how Indigenous centers provide a welcoming and non-judgmental environment that was separated from the ignorant and often racist encounters experienced from some staff (both academic and administrative)

and peers on campus. While Indigenous support centers will always function as safe spaces for Indigenous peoples to be themselves without judgment, this must also flow throughout the entire university system—in both its physical and ideological make-up.

Designing frameworks that embrace Indigenous visibility

In 2021, the University of Queensland released its *Aboriginal and Torres Strait Islander Design Framework* (Go-Sam et al., 2021). During the consultations that lead to the drafting of this seminal document many Indigenous participants expressed how they felt inadequately represented in the built and social environment—if represented at all. University campuses and the buildings within them are not passive receptacles but living representations and manifestations of place. Indigenous staff and students believed that the reciprocal relationships between place and Country and the cultural obligation to care for Country needed to be reflected in the built environment (McKnight, 2016), creating a greater sense of belonging. After all, university campuses remain on Indigenous Country that is filled with stories, cultural sites, and memories. Such knowledge however is either unknown or publicly hidden from view. Buildings need to have a connection to the landscape, avoid homogeneity, and reflect the diversity of place.

Indigenous knowledge derives from Country where one learns and responds to the connections between changing patterns and seasonal cycles. Knowledge is relational, emerging, and based in memory and lived experience. University campuses do not merely facilitate knowledge translation but are sources of knowledge unto themselves. Some participants of University of Queensland’s *Design Framework* spoke of how buildings “belong” to Country and that they should maintain physical connections and relationships to it e.g., via integrating elements of the landscape within its design. The landscape of a campus, inclusive of the buildings and infrastructure, has agency which is overseen and mediated by the university. With this comes a responsibility and obligation to care and nurture for Country. Indigenous staff and students therefore wanted to see the university actively pursue and include Indigenous people in design initiatives to create spaces in which Country could be cared for.

Universities are also places where Aboriginal and Torres Strait Islander peoples have excelled in both “traditional” and “western” knowledge systems. In many cases Indigenous scholars have bridging the perceived divide between the two knowledge systems (Gilbert and Bunda, 2017; Gilbert and Tillman, 2017; Synot et al., 2021). While the success of these individuals may be known within smaller networks, it is important to celebrate their achievements and contributions more widely. Pre- and postcolonial Aboriginal and Torres Strait Islander scholars and leaders should also be acknowledged and celebrated. Griffith University, for example, is considering renaming the university after Dundalli, the Dalla warrior who led the resistance in southeast Queensland (Hinchliffe, 2020). Participants of the *Design Framework* suggested that each faculty and school within the university needed to do more to showcase Indigenous excellence, highlighting how Aboriginal and Torres Strait Islander scholarship has shaped how we come to understand and respond to the world. This not only creates visibility and reassurance to Indigenous’ students, but also generates awareness among non-Indigenous peoples who, whether they are aware of it or not, are building, adding, and benefiting from Indigenous scholarship.

While we previously discussed the importance of establishing Indigenous support networks through Indigenous-led centers, consideration must also be given to the place in which these centers are located within the university. If place is taken as a communicator of social value and purpose, the space allocated to Indigenous peoples can provide rich insight into an institutions’ priorities. One staff member from the University of Queensland, for example, spoke on their objection to the space allocated to the Indigenous support center stating that they were “offended by the fact that we have been put into this building. I think it is an insult to us as First Nations people” (in Go-Sam et al., 2021: 22).

Other students spoke of how the lack of acknowledgment of Indigenous cultures and the fact that Indigenous spaces were often hidden, difficult to find, or unmaintained, communicated messages that Aboriginal and Torres Strait Islander peoples were unworthy of investment or public exposure. Some highlighted the role of threshold spaces (such as entries/exits to campus or buildings) in reiterating that universities remain on Indigenous Country. Reminding visitors of this does not only generate greater awareness of Indigenous sovereignty among non-Indigenous peoples but follows protocols of welcoming newcomers to Country not theirs.

The notion that universities are contested spaces arising out of colonialism is recognized and experienced by Indigenous peoples, daily. Many attest to the discomfort they feel toward the placenames, statues, buildings, and monuments that glorify and celebrate colonial exploitation—often at the expense and silencing of Aboriginal and Torres Strait Islander people (Bunda et al., 2012; Foley et al., 2019; Daley, 2018). Despite recent debates over the so-called “statue wars” and the place of colonial monuments in public spaces, symbols of colonialism will most likely continue to dominate sandstone universities (Gregory, 2021; Moreton-Robinson, 2022). In many cases, buildings and facades are protected by heritage laws.

Creating increased visibility of Indigenous cultures and standpoints, however, is not predicated on the erasure or “canceling” of western heritage (Nakata, 2007). Like the cultural competence training discussed earlier, Indigenous histories and truths may be exposed via engaging in transparent, open, and honest discussion about Australia’s history, including the history of the university. Recognizing the history, context, and contention of place as understood by Indigenous peoples (whether through plaques, artwork, statues, or digital media) provides an opportunity to proclaim their survivance and sovereignty while generating greater awareness among the wider public.

The practice of making Acknowledgments of Country during public addresses, events, or attached to signatures in emails and correspondence has increasingly been used to recognize Indigenous people (Pelizzon and Kennedy, 2019). While some see it as

a positive sign of reconciliation many have warned that it is problematic due its symbolic and tokenistic nature (Kowal, 2010; McKenna, 2014; Pelizzon and Kennedy, 2019). If not backed by commitments to make meaningful change, Acknowledgments of and Welcomes to Country can obscure the history and context of colonialism, providing a false sense of legitimacy or authority through which white sovereignty and the exploits that maintain its possession go unchallenged. A member of staff at the University of Queensland, for example, expressed (in Go-Sam et al., 2021: 72) that,

You cannot provide an acknowledgment of this country without deeply thinking about the arrangements that got the brick and mortars here. The theft of this land from Aboriginal people—I do want people to think about that. I want people to think about that quite deeply. I want them to be troubled by that. Because my family has been troubled by that because they have been dispossessed ... I am desiring a more honest engagement with us as Indigenous peoples, and without that troubling [there is no understanding] and there is always a superficial relationship.

Requests for Indigenous peoples to perform Acknowledgments and Welcomes to Country—particularly by schools, centers, and faculties that remain underrepresented by Aboriginal and Torres Strait Islander staff and students—can be time consuming and exhausting. As the above quote attests, to acknowledge Country is to also confront the context which led to the theft of Aboriginal land and Indigenous people’s ability to prosper, profit, and be promoted within the systems imposed by white colonizers. An acknowledgment is more than a mere verbal or written statement but must be backed by meaningful action and commitments to change. Creating Indigenous visibility within white universities requires multiple approaches that celebrates Indigenous cultures and excellence; maintains connections and responsibilities to Country; and confronts colonial histories.

Conclusion

Throughout this chapter we have drawn on research led by University of Queensland that provides foundational data on the factors affecting completion and retention rates of Indigenous students in higher education. This seminal research can be used to inform the implementation of evidence-based policies to improve completion rates and educational outcomes for Aboriginal and Torres Strait Islander peoples. The report, alongside initiatives such as the University of Queensland’s *Indigenous Design Framework* (Go-Sam et al., 2021), the University Australia’s *Indigenous Strategy 2022–2025*, and other academic literature, consistently demonstrates that Indigenous staff and students’ inability see oneself in the university environment contributes to their sense of belonging. This can ultimately impact academic outcomes; contribute to decisions to continue or discontinue their studies; or hinder career pathways.

We have highlighted the importance of universities establishing Indigenous-led centers of support, speaking to how they counter negative and often racist interactions experienced on campus by establishing safe, welcoming, and culturally aware spaces. Evidence demonstrates that Indigenous support centers have positive outcomes in improving completion rates among Aboriginal and Torres Strait Islander students. The reason behind this lies in the dedication of its mostly Indigenous staff who work tirelessly to ensure that it is a uniquely “Indigenous” space where students are made to feel that they belong; can raise grievances; and have a support network which has its students back.

The burden of closing the gaps in disparate educational outcomes, however, can only be realized through wider systemic reform that flows throughout the entire university system. Indigenous perspectives, knowledges, histories, cultures, and those who have achieved, and continue to achieve feats of excellence, must be visible. While the recognition of Indigenous sovereignty does not equate to the dismantlement of western frameworks—which continue to govern universities—it does require an open and honest confrontation of colonialism, inclusive of the opportunities it has created for non-Indigenous peoples and the systemic disadvantages for Aboriginal and Torres Strait Islander peoples.

As we discussed in relation to cultural competency training and Acknowledgments of Country, symbolic recognition is not enough. If universities remain committed to improving outcomes for Aboriginal and Torres Strait Islander peoples and the KPIs set by their own Reconciliation Action Plans, there must be compromise and a willingness to listen and avail oneself to the guidance and wisdoms of Indigenous peoples. This needs to be realized in the physical appearance of the university; within curriculum and pedagogies; in the numbers of Indigenous staff employed; and in Indigenous representation at senior positions where policies and strategies are conceived and voted on. Based on the findings of our research the following seven points should be taken on board when considering how universities might better reflect Indigenous standpoints and become welcoming spaces:

1. Universities must recognize that they exist on Indigenous Country and therefore have responsibilities toward its care.
2. Recognizing Indigenous peoples and cultures must translate to meaningful structural reforms that incorporate Indigenous perspectives and personae across all levels, including senior and executive roles.
3. Cultural competency and racial literacy must be improved so that systemic racism is recognized as a tool of colonialism that silences Indigenous outlooks.
4. Indigenous support centers are crucial to helping build a sense of community and belonging among Indigenous staff and students.
5. Strategies to support Indigenous students must be flexible, accommodating to their lived experiences, ongoing, and flow throughout the entire university.

6. Relationality is central to engaging Indigenous communities and building strong relationships. Education must be recognized as a component of community engagement.
7. The physical environment must incorporate Indigenous outlooks and perspectives.

To return to Gordon Bennett’s artwork *Echo and Narcissus* (1988) discussed in the introduction. In this work, Narcissus appears a white naked fetal-like figure, his lack of definition and crawling posture provokes a feeling of anguish and discomfort, as if his presence is alien and unsettled. As Narcissus gazes into the pool, it is Echo, an Aboriginal man, who provides comfort and reassurance through his gentle caress of Narcissus’ face. Until Aboriginal and Torres Strait peoples are recognized as the sovereign custodians of Country and are adequately represented within the social and physical environment, universities will remain places that are in a perpetual state of infancy and discomfort. It is through recognizing and celebrating Indigenous sovereignty, and the fact that Indigenous cultures continue to echo throughout the land upon which Europeans invaded and built their monuments to western civilization that healing, truth-telling, and reconciliation may begin.

Acknowledgments

We acknowledge the generous support of the National Center for Student Equity in Higher Education who have funded this research. We wish to thank the members of the reference group for their advice and guidance through the project. For assistance with organizing interviews, we thank the staff in the Indigenous centers/units at the five university sites. Thanks also to all of the Aboriginal and Torres Strait Islander graduates and university staff who were interviewed as part of the research. The Aboriginal and Torres Strait Islander Studies Unit at The University of Queensland provided a supportive environment to undertake the project and some resourcing to complete the project.

Introduction

Some of that change is generational. We're looking at generational change, and bringing our students through, and building our research literature, that takes decades.- Community talanoa one

Change is urgent in New Zealand universities. We have collected evidence for this for a significant amount of time, yet Pacific people continue to be under-served and excluded by our universities. Pacific academics make up less than 1% of Aotearoa–New Zealand professors and 1.7% of academics (Naepi, 2019a) and recently it was recognized that in order to achieve equity we needed 450 more Pacific academics and that at our current rate of change this would take 130 years (Tuhiwai Smith et al., 2020, p. 33). Pacific students have lower completion and retention rates (Naepi et al., 2021) and while over the last decade the overall all Pacific completion rate is increasing, closer inspection such as looking at the fields of society and culture, and the natural and physical sciences we can see that this increase is mirrored by the entire student body so the achievement gap persists (Naepi et al., 2021). UniversitiesNZ has previously identified that if parity of participation for Pacific students was achieved, an extra 1100 Pacific students would be completing degrees each year (UniversitiesNZ, 2018, p. 2). Significantly, solutions for this problem have traditionally focused on pedagogical approaches (Leenen-Young, 2020; Leenen-Young et al., 2021; Naepi et al., 2017) and knowledge inclusion (Nabobo-Baba, 2008; Naepi, 2021a; Suaalii-Sauni, 2008). Pacific peoples are a target group in higher education New Zealand for historical and contemporary reasons. Pacific peoples have had multiple migrations to Aotearoa New Zealand, the first wave of migration was that of settlement, when Eastern Pacific people explored and settled in Aotearoa and became tangata whenua. This first wave is important to the relationship between Māori (Tangata Whenua/Indigenous peoples of Aotearoa) and Pacific peoples as it created bonds and relationships through culture and genealogy in Te Moana Nui Kiwa (greater Oceania kinship connections) (Health Research Council, 2014). Importantly this relationship further cements Pacific peoples recognize the deep commitment needed to Article 2 of Te Tiriti o Waitangi – Tino rangatiratanga (self-determination) and the importance of tangata whenua authority and autonomy in Aotearoa. One hundred and fifty years ago, Pacific peoples arrived in Aotearoa as trainee teachers, missionaries, sailors, and whalers in a second wave of migration.¹ The third wave followed 70 years later when Pacific peoples who had served the colonial government as civil servants within the Pacific “territories” or in the colonial armed forces were able to move to Aotearoa (Macpherson et al., 2001). The fourth migration, which occurred 50 years ago, was perhaps the most significant and is the migration story with which most people are familiar today. For the fourth migration, Pacific people migrated for economic reasons and found work in the manufacturing and service sectors in post-war Aotearoa (Fleras and Spoonley, 1999; Macpherson et al., 2001; Macpherson, 2004; Te Punga Sommerville, 2012). This history has meant that Pacific peoples are more than a “diversity group” within New Zealand education systems.

¹New Zealand officially colonized Samoa from 1920 to 62, the Cook Islands from 1901 to 65, Niue from 1901 to 74, and Tokelau from 1926 to the present, with Niue and the Cook Islands remaining protectorates of New Zealand (Te Punga Sommerville, 2012).

For us, if you love your students, then if you see something's not working, then you change it! Talanoa Nine

The shift to parity/population matching for academics and students provides another avenue for change. However, as I have previously argued this approach to change should be considered through the lenses of racial capital (Leong, 2012) and specimen collecting (Musser, 2015) in order to ensure that Pacific people within institutions do not just become another desirable diversity body (Ahenakew and Naepi, 2015) that serves the purpose of the university but not of our own communities (Naepi, 2021a).

We can't wait for policies to change. We cannot wait for the big money to come through. So the service is integral to growth of community, otherwise we're going to go backwards. And in some regards, somewhere we have in terms of education. Government throws out these glamorous statistics, but they're all not as rosy as we know. So that is urgent. That's our requirement as part of the academy. And often we do it for no money. It's never about money. It's never about our position. It's just about support and encouragement of our peoples. - Talanoa Seven

The call for change has not gone unheard. In the 2013–17 Pacific Education Plan aimed for at least parity in all aspects of education for Pacific peoples (New Zealand Ministry of Education, 2013). The most recent Pacific Education Action Plan calls for addressing structural bias that prevents Pacific success (Ministry of Education, 2021). Importantly, the report that informs and provides explanation for the plan outlines that “in spite of universities’ public commitment to supporting Pacific peoples in tertiary study, a substantial amount of work is needed to address the ‘white masculine imprint’ on university structures” (Ministry of Education, 2021, p. 14). We have also seen a shift in how our universities base research grant funding is delivered; the Performance Based Research fund (PBRF) now weights research Evidence Portfolios from Pacific researchers at 2 and research Evidence Portfolios submitted to the Pacific research panel at 2.5 (Tertiary Education Commission, 2021a). This fund is worth \$321 million a year (Te Tai Ōhanga The Treasury, 2020) and unsurprisingly has resulted in a significant shift in university recruitment and research priorities as some universities faced a significant loss in revenue (Naepi, 2021a). For Pacific students the Tertiary Education Commission provides additional funding per Pacific EFT ranging from \$325 to \$450 to support higher education institutions to provide the support needed for learner success (Tertiary Education Commission, 2021b). Again, this is not a small amount of money as in “2020, the University of Auckland – which reported 2843 Pacific EFTs, of which 86.3% were below level 7 qualifications and 4% level 7 or above – would have received in the realm of \$747,000 in additional Tertiary Education Equity Funding to support Pacific student success” (Naepi, 2021a, p. 24). The government expectations of equity have resulted in universities across Aotearoa New Zealand making commitments to Pacific communities that are primarily focused on the politics of inclusion.

The plans are only as good as the implementation, and the energy of the people behind it. - Talanoa Twelve

At some point we must ask how much qualitative and quantitative (Ahenakew and Naepi, 2015; Airini et al., 2011; Barber and Naepi, 2020; Leenen-Young, 2020; Leenen-Young et al., 2021; McAllister et al., 2020a,b; Naepi, 2019a, 2020, 2021b; Naepi et al., 2020, 2021; Suaalii-Sauni, 2008; Theodore et al., 2018a,b; Thomsen et al., 2021) evidence is needed for change. Recording the different ways that we are excluded or underserved can support and drive structural change like the shift in the PBRF, however, that change can be slow and often the generation of students or staff in front of us need change today. This chapter attempts to complement the work that is being done to record the different ways that Pacific peoples are excluded and under-served by offering some insight into how Pacific women go about the everyday work of changing the university. Ultimately, what drives this chapter is the belief that the academy can be redeemed, and it is with that in mind that exploring how Pacific peoples engage in change becomes urgent; as we simply do not have a 130 years to wait for equity (Tuhiwai Smith et al., 2020, p. 134). Instead, we must engage with how we can accelerate change because business as usual or the polite politics of inclusion means that we will not experience the change necessary for another four generations.

Ideally change is supposed to be revolutionary - Community Talanoa Four

Utilizing Masi methodology to frame twenty-seven talanoa with Pacific women who worked in Aotearoa New Zealand's universities this chapter explores how Pacific women engage in change. In writing this Chapter I have fought the tension to make it completely comprehensible and to also reflect the voices of the women that I worked with. So, instead this chapter is something of a middle ground; a clear narrative with moments of interruption to enable what Ahenakew referred to as a shift from sense-making to sense-sensing (2016, p. 333). These interruptions provide an opportunity to see that while I write about the university, Pacific women experience the university; all these interruptions come from the talanoa.

So maybe our secrets will be shared, but we wouldn't have partaken in your research if we had fear of that being used against us at a later stage. I think that our voices need to be heard more broadly and more widely, and regionally, but internationally as well. - Talanoa Seven

What this chapter offers is an exploration of how Pacific women engage in change making in our universities with a slight bracketing that not all of our secrets to change will be recorded because some of them we need to continue sharing in our whisper networks so that institutional habit (Ahmed, 2012) doesn't catch us unawares and find ways to block the change we desire.

Mapping our journeys

It is common in Pacific education circles to use wayfaring as an analogy for our journeys through the education system. Just as our ancestors were able to articulate and travel to what was beyond the horizon, we can imagine a better educational system before we arrive there. Pacific peoples' have been scientists since time immemorial; our ancestors navigated the world's largest oceans repeatedly and intentionally by reading the stars, watching the birds and listening to the ocean as we navigated from one island to the next then beyond to the horizon. Pacific peoples in the academy continue this tradition by intentionally engaging in career mapping; by understanding what we need to travel to the next island and being aware of what slows us. Fig. 1 provides an image of the necessary navigation for Pacific people through the academy. In Fig. 1 the storm that slows us are institutional habits (Ahmed, 2012) that are foundational to our institution's existence. The numbers above don't just happen, instead the foundations of colonialism, neo-colonialism, neoliberalism, sexism and racism in the academy (Naepi, 2021a,b, 2022; Kidman, 2020; Kidman and Chu, 2017, 2019) combine to create a storm that slows our progress. Importantly, Pacific women recognized that these storms existed and that they did slows us (Naepi, 2021b). This is where the analogy of storms as opposed to walls is useful. Pacific navigators understood that storms could be weathered, avoided or harnessed. But before we could do any of that we had to capture them, to know they existed and so this chapter captures storms by recording how we respond to them; by enabling us to see how Pacific women have practiced change in our universities.

Masi methodology and talanoa

Masi methodology is an Indigenous Pacific methodology that centers Pacific women in the research process (Naepi, 2019b, p. 237). Masi methodology ensures that throughout the research process Pacific women's voices are included by "recognizing that the work and knowledge that Pacific women do and hold is valuable throughout our lives" (Naepi, 2019b, p. 238) and that the research is "intentional in viewing Pacific women as knowledge holders who are experts in their field. In practice, this means centering Pacific women's voices as authoritative and having something to offer beyond the limits of the academy's understanding." (Naepi, 2019b, p. 238). Masi methodology was the methodological framework that resulted in the decision to use talanoa as the method. Talanoa is a Pacific narrative inquiry method grounded in the understanding that knowledge is created in relationality (Naepi, 2019c, p. 11). Talanoa is an established Indigenous Pacific research method (Fa'avae et al., 2016; Farrelly and Nabobo-Baba, 2012; Otunuku, 2011; Prescott, 2008; Reynolds, 2017; Suaalii-Sauni and Fulu-Aiolupoeta, 2014; Vaiolotti, 2006) that is based on the Pacific cultural practice of talanoa (Manueli, 2012). Importantly, Prescott's (2008) in depth exploration of talanoa in comparison to the modern interview technique noted that an interview is primarily focused on gathering knowledge, whereas talanoa is about creating or strengthening relationships and coming to reach a state of understanding between those involved. In 2017, in a study on sport management and talanoa, Stewart-Withers, Sewabu, and Richardson summarized talanoa as:

Fig. 1 Pacific navigation of academic pathways (Naepi et al., 2020, p. 153).

a process which affords value to, for example, kinship, land, tradition/custom, relationships, ancestors, ceremony, cosmology, space, language, ethics, the chiefly system, systems of faith, and protocols. Talanoa encompasses behaviors/manners such as openness, patience, tolerance, flexibility, silence, humility, generosity, gifting, reciprocity, humour, empowerment, listening, sharing, forgiveness, and subjectivity. (p. 59)

There are two types of talanoa represented below. The first are the initial one on one talanoa and the second are community talanoa. In alignment with masi methodology this research recognized that Pacific women should have the right to confirm the research reliability and validity as authoritative voices of their own stories. As such the community talanoa were in relation to the one-on-one findings where Pacific women were asked to confirm and expand on what had been shared so far. So, it is through a strengthening and building of relationships that these stories of change for Pacific women have been gathered. These talanoa represent 216 years of collective knowledge as Pacific women attempting to change our universities.

I was surprised how very angry I was, and I thought about that for a long time afterwards, the necessity to have platforms to talk about stuff, it keeps coming back to me a lot, between that one and this one. Having had a chance to process some of that stuff and going, okay, I can put it aside and continue on, but now at least I know that that is there and was there, and was a part of my experience, and it's better to know that something is living with you, then to have it suddenly flare up. Something that you weren't aware of, explode in the committee meeting somewhere, so thank you for allowing that part of my academic experience to breathe, to see the light of day, and I think move to a healthier place. - Community Talanoa One

Slow change

Before beginning a discussion on Pacific women's approaches to change in our universities we need to recognize that change is slow and how Pacific women have articulated this slowness helps us to further understand the different approaches that they take to change.

Change in universities is slow because so much of what universities do are steeped in tradition or as Ahmed would say in institutional habit (Ahmed, 2012):

a slow, it's ever slow, slow-moving, because it's so steeped in its tradition – Talanoa Nine

Change as something to be chipped away at, and Pacific women recognize that the revolutionary change we desire may not be possible:

It's a bit more of an indirect way, but challenging [the discipline] as whole, it's never really been a very revolutionary way. Well, at least I don't think so. I think it's just clawing or trying to bash your way or itch your way into where it's just a little bit at a time.....That's why you just have to chip away and put a little bits here and there - Talanoa Four

Part of the slowness of change is that some people simply don't want change and that the bureaucracy of change is a source of frustration:

It's there, it's just that some people don't want the office space to change. People in the office don't want to change, and then, say, if we wanted to bust down a wall that's like property services going nuts at us because we just take down one wall to make a student space. It's there. There's just too much red tape to get through for different people, and so that's really annoying - Talanoa One

However, change is a driver to keep Pacific women in our roles but also placed a time limit on how long we were willing to wait for change:

The quest to set things in change is what keeps you there. The fact that maybe you begin to see some change happening is very uplifting. But I think in order for me to stay in this position, something will have to change. I'm assessing the position, I'm in it for two years, so at the end of those two years I will certainly have a think about, am I able to manage this responsibly? - Talanoa Four

Pacific women recognize that change takes times, particularly in universities and that this can be a source of frustration. However, we also recognize how seeing change can be a motivating force for staying in a role. Importantly, for us while we are aware that change takes time we are also willing to put a limit on how long we are willing to wait for change.

Utilizing the university to make change

Pacific women know the importance of understanding the university and utilizing policy for change. The university is a tool to be wielded and the university can be used to support wider plans for change:

I think about being us. I think I recognize that the university does its thing. I see the university as being able to be co-opted into some other bigger plan, and that what I need from a university is the space to be me. - Talanoa Fourteen

We often understand the importance of understanding where power lies and who wields it:

It's understanding how policies get made, and who makes it. It's understanding how power is ... Where power resides, and who wields it. It's understanding how the system works, then that's kind of really as bland as that. When you come into the space you got to be a very good observer of who has the power, who has the power over what, and then who makes the decision over what. If there is something that I need to change, I always make sure that I know who is the last person down at the end of the chain that needs to make that decision, and then basically go straight to them. - Talanoa Twelve

Importantly, we also understand that in order to drive change sometimes it is Pacific women who need to need to wield that power:

"I've had someone, our Associate Dean Pacific saying things like, 'We need you guys to be sitting at those tables where those conversations happen', and for me, it was like that's never going to happen, and then you think, but then you have to, you have to, because it's not just you." - Community Talanoa One

Sitting at the table often also means understanding the people at the table and being aware of how they think:

I appreciate the, don't change who you are, your values is what got you here, and I absolutely believe that, but I'm learning that to be able to get to that table and sit around with those key people, you've got to be able to think like them too. - Community talanoa one

Driving change can also mean sharing with others how the system works and how to navigate around and through it:

also one way I do change is I tell the students how to get around the system... ... if you've been here long enough, you kind of know how the system works. but it's just knowing these little things that can make a difference, and that's how I see change - Community Talanoa Four

It is in the day to day details and being aware of finer details within the system that we can disrupt business as usual:

pragmatic things that we have to deal with every day, and we must read the details. We have to do the paperwork. We must attend to those finer details in the system, otherwise, that's where the system engulfs a more white privileged, white mainstream approach to understanding students. And those are major impacts on students. - Talanoa seven

Pacific women see the university as a tool to be utilized in change but also recognize that in order to be able to do this we must be aware of where power lies and have a seat at the table. The seat at the table means ensuring that we understand how others around the table think and what motivates them while simultaneously not changing who we are and our own values system. Often this can also mean reading the details and utilizing these details for change. Pacific women who do all these things also believe that for change to occur we need to share this knowledge so that others can navigate around and through the system.

Working with allies to make change

Pacific women see a role for allies in change making in our universities, particularly when it came to pedagogical practice. Sometimes these allies had established relationships:

I'm going to be working with a palangi friend to help us. She's trying to bring about introducing Pasifika methodologies and practices and theories into the way people teach Pasifika students in science. And you know, she's going to be asking them how are you going to transform your teaching practices to be inclusive of Pasifika world views. - Community Talanoa Four

It is helpful when allies are keen and want to engage as then they can be pushed to think about wider changes:

So what's also good about that, is that he is so open and, genuinely keen. And so he said "Oh this has been a great start." And I actually emailed and said, "Where do we go from here so why don't we have a meeting and start to think about how we could audit, not audit, but how we could provide some kind of mechanism to look at what's being taught and where there needs to be some changes in what's being taught. Looking at where our Pacific learners are struggling and what could be modified. - Talanoa Thirteen

Positive reinforcement when working with allies was also identified as a key change mechanism, with Pacific women reflecting that sometimes too much critique led to defensive responses:

And then we never get change. You know? So again that's very much from what my parents taught me, it's about working with people to effect change rather than continually criticizing because then they won't, they'll just get defensive. Talanoa Thirteen

One particularly insightful moment was when a Pacific women shared that she recognizes that authority that having an ally can bring to a program and that she chooses to protect her community in the short-term to enable long-term gains:

So, I share one of my main leadership roles, but sometimes people have difficulty seeing me as a leader. So, I choose to share this with a man- older man. It just provides a level of safety for my team. If it was just me, I would be okay to take that risk and just see if I can hold the land. But there's 10 other people whose jobs rely on us to be trusted, so I have my colleague there for those people who can't see me. They see him and they're reassured that there's someone in charge who looks like someone that they want to be in charge. - Talanoa Ten

Pacific women understand that allies are needed for change. Often this is occurring in relation to pedagogy, where Pacific women can support professional development for allies in how and what they teach. Importantly Pacific women recognized that allies need to be encouraged and that too much critique can lead to disengagement.

Collective action for change

Unsurprisingly, given the relational ontology of Pacific peoples collective action was seen as a key method for change in our universities.

Pacific women noted that despite critique of inclusion politics these things were needed for change and that everybody was playing their part increasing change:

Yeah, everybody's playing their part, though. We actually need that profiling in the choir. We also need the money, and then we need the people who are part of the advisory group, including [senior pacific male], to help set that up and to validate it as well. So, it's not going to be any one person. - Talanoa fourteen

Coming together is a way of bringing together a collective energy for change that can produce the momentum needed:

together as a collective we have decided that we would put all of our energies together and hopefully, the accumulation of all that energy is going to give us the momentum. - Talanoa Twelve

Collective action as provides strength:

It's strength in numbers, which you've got to have the support of those around you because, you can beat something when there's more of you behind it. It's hard to do by yourself - Talanoa Three

Collective action is an extension of how Pacific families operate and that when we do this, we will all thrive:

Whereas, if we have a collective, we're all moving forward together and we're all helping each other to get to that next level. Whatever it happens to be, it might be cultural skills, it might be language, it might be being comfortable going home to your home country with other professionals here. It might be teaching. It might be doing research. Whatever it takes. Whatever that next step is, and the next step. Just like we'd do in a family. And treat all kids the same, you know. Build on the things that they have and try to see a space for them that will thrive. – Talanoa Ten

Importantly, Pacific women identified that one of the reasons change maybe so slow currently is because there are individuals who drive their own agenda as opposed to working collectively:

Because, oftentimes, I think one of the reasons why change is slow is it's just based on one person's agenda, or what they think people should benefit, rather than this is what people are actually saying. They just maybe go on with their own agenda. It's all about you. – Talanoa Nine

Collective action enables change. Pacific women see collective action as a continuation of community practices and understand that collective action gives the energy, momentum and numbers needed for change. Collective action also enables us to recognize the different contributions that everybody makes to change whether is polite inclusive politics or radical calls for change.

Choosing change

Pacific women see change making as an active choice that can be a decision to go against the university or your colleagues. Pacific women recognize that they have a choice in change, and that sometimes the choice to disengage from change reflects the many battles they have had to engage in over their career, month, week or day:

And it comes from different places, that lack of safety, as well. And I think that sometimes we have more or less resilience to that, as well. So, there will be some times where I'm like, "Right, I'm gonna start a war. I'm gonna go to town on something here, and I have to say this." And then there's other times where I think, "Actually, right now I don't have the resilience to deal with what will come. Is this a stand on the big one, or can I let this battle go today just to save my own sanity?" Talanoa Ten

There is a risk to choosing change, but we engage anyway as we don't want to change who we are in order to be rewarded:

And people who tow the line get promoted, or they sit on committees, or they become the professors in some respects. The people who antagonize the systems like ourselves, and push the boundaries, we're seen as renegades, or we're seen as the problems ... For me, I can't be someone I'm not, and it makes me feel really uncomfortable, for example, that when decisions are made in the system or the institution that don't fit Pacific students' needs, or Maori students' needs, or indigenous students' needs, that we have to really be loud and scream about in some respects, and I hate feeling uncomfortable like that because I don't want to tow that line. I don't want to go against what our students are about, or our pupils are about, because in some respects, that's why our people are down, because people have been towing the line. We haven't been pushing enough boundaries. We've been giving in. We've been colonized, you know? It's like coming back to decolonizing our mindsets, and standing up for who we are and being who we are, but in a positive and a strength-based way, and affirming our identities - Talanoa Seven

For Pacific women change making is a choice that needs to be actively engaged with. Unfortunately, it is a choice that comes with risk and that often those who choose the status quo are rewarded. However, sometimes choosing not to engage with change is not because Pacific women are choosing the status quo but are instead choosing their own wellness.

Mentoring for change

Pacific women recognize the role that mentoring plays in changing their own trajectories. Pacific women often spoke of the roles that mentors played in supporting their wellness or career progression; mentoring was a key factor in change making.

Mentors did not always have to be Pacific, Pacific women noted that non-Pacific mentors who "clicked" were helpful and able to advocate for them around decision making tables in order to support more Pacific to come through the university:

You can have some really good mentors who are not Pacific. It's kind of getting a click with somebody who gets you, you know? There's that, and then there's the people who have opportunity to open up the minds and the awareness of those who sit around decision-making tables about the issues that are involved, and so allow for a lot more of Pacific people coming through - Talanoa two

There is a desire to interrupt any narrative that suggested we progressed without mentors. Instead, there was recognition that it is a collective effort to get the individual to the spaces and places they enjoy:

So that's mentor stuff. I think for anyone in academic career, anyone who manages to get into an academic position would always wanna identify mentors and stuff. It's rubbish that we're doing this on our own, though, really. And there's so many little things along the way to bump you and push you in the right direction. So those two people were really influential... And I sure there were many many mentors and support people throughout my experience that kept me going. - Talanoa four

Peer mentoring and the role of reciprocity and relationality is important in mentoring for Pacific women:

One of them was my writing buddy mentor. She refuses to be known as my mentor, cause she says in that our writing sessions, she gets as much out of it from me as I do from her. So there's that reciprocity that seems to work really well, as well as having really in common some of the basic principles of centrality of family, you know, joy of life, and living big lives. - Talanoa Five

Universities also provide opportunities for mentoring that are not always culturally bounded:

Well, the North Island University put on some great leadership development opportunities. It was a matter of stepping into them, really. So, they have a leadership development program. They have a women in leadership program. They had a chair mentoring program. All fantastic, and they're not culturally bounded. - Talanoa Fourteen

Mentors were the people who encouraged Pacific women to progress with study and the importance of having core qualifications to move through the university

it wasn't until I talked with a senior Pacific woman about how we're going to get to where we need to go? Well, we need some associate professors, we need some professors, because they're the people who will be in the room. That there's certain jobs that a university won't give you until you have that tick box and a PhD is one of them, but certainly the associate professor/professor stuff is one of them too. - Community Talanoa One

Mentoring plays a key role in providing critical advice about how to do our jobs:

And the one enduring practice that all our mentors have shared with us, whatever you do, you do it now. Make sure that you have the resources. Make sure that you share with others, and tell others what you want to teach and how you want to teach it. And also make sure that you have the time off. So it's about maintaining equilibrium within the teaching ratios and all that, and also the research and that - Talanoa Six

Mentoring was identified by Pacific women as a key practice for change. Mentors came in many different forms as peers, institutional, Pacific and non-Pacific. Mentors were seen as key informants for explaining institutional norms and progression advice. Mentoring for change reflects that Pacific women understand there is an aspect of personal development needed to advocate for change, to ensure that Pacific women can sit "at the table."

Conclusion

So you take the training that life, and universities, and research, and your own reflections on who you are and what you've got, and you put that into the policy government environment. All of those tools are needed, along with a good dose of relations, relationships. Then you just set about making the change that's needed. - Talanoa Fourteen

It is unsurprising that Pacific peoples have multiple approaches to change. Universities are complex institutions that require interventions at multiple sites in order to drive the long-term structural change that is needed to advance Pacific peoples. What these talanoa share is a recognition of both the capacity of higher education to be a positive force while also recognizing the behaviors and structures within higher education that need to change. While change is slow it needs to be recognized that Pacific women push this change in their everyday work in the university through sitting at tables, operating as a collective, mentoring each other, working with allies and actively choosing change.

A future question is, I think it's about potentiality. Maintaining that there are always possibilities. Anybody can do it. You're going to come across a lot of changes, but for Pasifika woman, it's about just getting it done. And always maintaining where you've come from, and celebrate that and celebrate the present, but also try and leave something behind. - Talanoa 6

Post-script

I completed this project before getting my first permanent academic job. Reflecting on these Pacific women's words has been a powerful and inspiring moment. At times as an early career Pacific researcher I can get lost in the weeds of the everyday. Revisiting these words have reminded me that I am not alone in this fight, that Pacific women have agitated for change in many ways and at many different levels for some time now. Importantly though, we have done so together. That is the takeaway from this work – that for anything to truly change we must advocate together and resist the temptation to embrace the neoliberal individualistic academy that would turn us against each other as we labor in the everyday work of change making.

The reason we can't pinpoint those moments of change-making is because our every moment in that institution is change-making. Our presence in those offices, our presence in those conversations is a moment of change. So how do you pinpoint that one moment, when every day what we do is change-making? - Community Talanoa Two – Sereana Naepi

Acknowledgment

I would like to acknowledge the University of British Columbia Public Scholars program for supporting this research. I would also like to thank the Pacific women who joined me in talanoa – I often reflect on what it meant to sit with you all so early on in my research career and how that has shaped my pathway forward Vinaka vaka levu.

This article will examine the development of an indigenous doctoral program from Aotearoa, New Zealand. The program is located within an Indigenous institution, and is influenced by philosophies, methodologies and practices that are embedded within indigenous ways of knowing and doing.

The establishment of the program involved community ideas and expectations in the development phase that has translated into a program wherein students “give back” to their communities through their research and the solutions evident in that research. The focus is one of indigenous development and advancement that requires a commitment by students to create solutions to existing issues and matters deemed important by their communities or indigenous organizations.

Setting the context for why we need an indigenous doctorate

The main doctorate offered by institutions within the New Zealand tertiary (higher education) context is the Doctor of Philosophy (PhD), which is carried out over a minimum of two to four years of study. Middleton (2001, p. 4) states that the origin of the New Zealand PhD was in “the soil of British colonialism and the early provincial university ... were colonial sites for the assimilation of British national culture or civilization.” Māori engagement with these doctoral programmes has been through these very colonial sites, which have been hostile to Māori knowledge, practices and belief systems because the assimilatory agenda to civilize Māori had resulted in the banning of Māori language, restrictions placed to suppress Māori knowledge and the general overarching desire to introduce Māori to the ways and thinking of the British.

Additionally, Māori were also actively dissuaded from attending universities through practices like those at secondary schools, which limited their options and choices. For example, restricting curriculum choices for Māori resulted in them not meeting the entry criteria to attend university, options that were driven by policies and practices based on racial categorizations, which argued that Māori were more suited to menial/manual work rather than academic (Barrington, 1988).

While access to universities was theoretically achievable for those who could put aside their “Māori ness”, being able to enter the university system had its own set of challenges. Doctoral enrollments required individuals to have a foreign language requirement, English being the main language with Māori language not considered viable. Doctoral study for many Māori was seen as intimidating, foreign and unobtainable (Johnston, 2010) and with the earlier practices of undertaking doctoral study at a foreign university, restricting further the chances of Māori to engage in doctoral work.

In 2001, Sue Middleton completed research on “New Zealand Education PhD’s 1948–1998” in which she explored several factors that further contributed to and/or hindered the PhD process for students. Middleton (2001) examined students family backgrounds, the role those tertiary institutions played in supporting students, supervision practices, examination practices etc. Some Māori were involved in that study as participants.

Likewise, my own research in this area (Johnston, 2010) highlighted a few factors that dissuaded Māori from seeking doctoral qualifications which concurred with those of Middleton (2001) but additionally highlighted tribal and whanau (family) commitments often taking precedence over doctoral study, which saw many PhD students taking longer to complete their qualifications.

Between 1952 and the end of the year 2000, the number of Māori to graduate with PhD’s in New Zealand was small (approximately 55) but over the past decade there have been increasing enrollments of Māori into PhD programs (Ministry of Education, 2001). In 1999, history was made when 3 Māori women graduated PhD from the University of Auckland (Garner, 2000) and at the end of 2000, 3 Māori men from Massey University, the first time that more than one person of Māori descent graduated PhD in any given ceremony at any specific university.

The first person of Indigenous descent (Māori) to graduate with PhD was Maharaia Winiata (Tribes: Ngai te Rangi, Ngati Ranginui) from Edinburgh University in Scotland 1952. Between then and 1990, several more Māori received their doctorates from overseas universities with the first group of consolidated New Zealand based PhDs being produced in the 1990s (Pohatu, 2001). The latter is perceivable because of a shift in university practices regarding the use of Māori language and the incorporation of Māori language as either a linguistics subject or a Studies positioned under anthropology. This space however was still contested.

The difficulty of precisely defining the exact number, is a difficulty of working within a colonial climate whereby identifying as Māori was not necessarily a positive action because of ongoing racial beliefs and views that presided within New Zealand about the ability of Māori. The data on actual Māori graduates with PhD is therefore inconclusive. However, the 2007 National Māori Academic Excellence Awards noted and celebrated 183 graduates between 2002 and 2007 ([Prov-Vice Chancellor Māori Office, 2007](#)).

There is also evidence that Māori are gaining PhD in areas like Chemistry and Science, where historically they have not been located before. The increase of graduates means that universities can employ doctoral qualified Māori staff where previously, none were to be found. While the number of Māori graduating with PhD is on the increase, the numbers are still disproportionately lower than those for Pakeha students (members of the dominant group) ([Tertiary Education Commission, 2009](#)).

Research focusing explicitly on Māori with PhD is minimal although a three-year project investigating specifically the supervision of Māori Doctoral Students ([McKinley et al., 2007](#)) has been completed. Given the growing numbers of doctoral candidates ([Tertiary Education Commission, 2009](#)), this is an area within education that needs further investigation to enable us to identify and understand what contributes to success for Māori students, and what does not.

The focus on producing more Māori graduates has also been supported through the activities of organisations who are developing programmes to support Māori Doctoral students, for example Nga Pae o te Maramatanga—a National Institute of Research Excellence for Māori based at the University of Auckland and its national Program for Māori and Indigenous Post-graduate Advancement (MAI). Further incentive is perceivable in funding, like for example an equity component that rewards institutions for graduating Māori PhD (Performance Based Research Fund Research Degree Component) and policy strategies bedded into the [Māori Tertiary Education Framework \(2003\)](#) and [Tertiary Education Strategy 2007–2012 \(2007\)](#). Given this type of focus the likelihood of continual graduates, growth and development of Māori with PhD looks inevitable.

Setting the context for why we need an indigenous institution (step 1)

In 2005, Te Whare Wānanga o Awānuiārangi (Indigenous Tribal Institution based in Whakatane, New Zealand) enrolled their first students into their own PhD program. The program had been approved the previous year by the New Zealand Qualification Authority (Government Accreditation Organization) after several years of application that included substantial challenges leveled at a non-University institutions desire to offer a PhD program. While education policies at that time did not declare that Wānanga could offer doctoral programmes, neither did they state that they “could not” and it was in this latter space that Awānuiārangi contested the right to offer a PhD program.

Traditional Whare Wānanga existed in New Zealand prior to colonization and were considered the highest places of learning where the teaching of information was subjected to exceptionally rigorous and demanding processes, accessed by “experts” and superior families and not available to all. Whare Wānanga were clearly places of excellence, focused on quality that insisted on only the best. Indeed, the mission statement of Te Whare Wānanga o Awanuiārangi reads:

Rukuhia te mātauranga ki tōna hōhunutanga me tōna whānuitanga

Pursue knowledge to its greatest depth and broadest horizons.

Te Whare Wānanga o Awanuiārangi has qualities that make its contribution to the tertiary sector unique and necessary, unique in terms of āhuatanga Māori (Māori ways of knowing and doing) and necessary in terms of Māori decision-making by Māori for Māori. It offers programmes that are “niche” targeted, (meaning designed for and with Māori communities), programmes that are complementary to university and other tertiary operations, while resisting the assimilation of things Māori to be “described, labeled and categorized in a Western manner” ([Johnston, 1998](#)).

In terms of offering a doctoral program, the distinctive characteristics of Te Whare Wānanga o Awanuiārangi and its contributions should not be underestimated. The general perception of the Wānanga is one of being a “Māori institution”, interested in offering only “Māori things” to a largely “Māori audience”. However, section 162, 4(b) iv of the 1989 Education Act provides a broader definition.

A wānanga is characterized by teaching and research that maintains, advances and disseminates knowledge and develops intellectual independence, and assists the application of knowledge regarding āhuatanga Māori (Māori tradition) according to tikanga Māori (Māori custom).

[Mead \(2003\)](#) states that the definition of āhuatanga and tikanga Māori in the act is not clear and is slightly restrictive as the English equivalents do not do justice for the concepts of āhuatanga and tikanga. In viewing the first section of the clause however, there are several key responsibilities that a wānanga is charged with over and above āhuatanga and tikanga Māori, which are often not highlighted. The key words are “teaching” and “research”, “maintain”, “advance” and “disseminate”, “knowledge”, “intellectual independence” and “application”, the same sorts of activities one would expect from any tertiary institution—activities of quality, excellence and rigor. Thus, Wānanga are expected to perform according to national criteria (for example, research and teaching),

internationally set benchmarks (for example, the PhD program), and are subjected to the same forms of evaluation, monitoring and moderation as other tertiary institutions. And there the similarity with other institutions ends.

Wānanga are also expected to perform to tribal criteria, tribal benchmarks and are subjected to intense tribal evaluation, monitoring and moderation—which other tertiary institutions are not. While other tertiary institutions enjoy measures of autonomy and decision-making, Awanuiārangi must always consider the desires, visions and views of those tribes whom it works with and the Māori/indigenous communities that it serves—to build educational capability, dissemination of language and knowledge, to teach and research. This is one of the many unique features of this institution.

As a result of our mandate from the 1989 Education Act, Awānuiārangi is charged to consider how the development of new degrees and programmes are responsive to community needs, goals and interests and it is those needs etc., which drive what Te Whare Wānanga o Awanuiārangi produces. Those developments are different from what is offered through other tertiary institutions because of our dual national/tribal requirements.

A primary vision of the institution is to promote, grow and sustain all aspects of Māori language, knowledge and culture and have regard to tikanga Māori practice. Te Whare Wānanga o Awanuiārangi has also developed a range of Māori educational opportunities and advancements designed to positively impact the social, economic and cultural growth of Māori communities and iwi. Being able to offer a doctoral program was key to meeting those aspirations, thus incorporating the visions and aspirations of indigenous peoples more generically. The breadth of our learning provision is therefore expansive (based on need and aspirations) and extends from marae (traditional Māori community places) and community-based learning programmes up to graduate programmes at Master's and Doctoral levels. These programmes focus on the theme of Māori development and advancement and benchmark to a wider body of international indigenous research activity.

Developing a school of Indigenous Graduate Studies (step 2)

Te Whare Wānanga o Awānuiārangi launched the School of Indigenous Graduate Studies in June 2008, which was charged with providing a graduate program that incorporated quality learning/teaching experiences for students. Awanuiārangi was accredited two Master's Degrees in 1994 and as the inaugural Head of Graduate Studies (2004) and then the School of Graduate Studies (2008) one of my roles was to pursue accreditation of a Doctoral Program. This led as mentioned previously, to offering of a Doctor of Philosophy in 2004 in four areas: Indigenous Studies, Māori Studies, Education and Environmental Studies.

To support the fledgling doctoral program, a number of aspects in the School were created that drew from indigenous networks and ways of operating. For example, the creation of a teaching adjunct faculty of indigenous/Māori PhD, (many of whom are furthering iwi/hapū/tribal developments in their own spaces) was enabled, linking students into community networks or research centers. The School also drew from this pool of faculty members to offer students co-supervisors based in other areas and institutions, who could add to a student's topic by providing networking support and the latest up to date research information in their fields. The adjunct faculty members complimented Te Whare Wānanga o Awanuiārangi current supervision pool.

The growing demand for Doctoral Study was met through the growing number of PhD credentialed staff via contractual secondary supervision arrangements and a Graduate Adjunct Teaching Faculty comprising Indigenous PhD holders from within New Zealand (and from around the world), who were available for thesis supervision. These developments meant that academic programmes like our PhD were drawing from the experience, knowledge and vision of Māori at national and international levels and indigenous scholars internationally.

Other measures for providing support included inviting colleagues and friends in other institutions and communities to support students as advisors, mentorships for supervision. Additionally, four annual "block courses" were run (this is not usually done for doctoral students in other institutions) that saw persons with expertise invited to work with students, and for students themselves to work and be connected to each other, thus creating collegiality and support networks. Within the block courses, students stayed on site at the Wānanga having freedom and space to work independently or to further conversations and develop networks for and with each other, as their research and study necessitated.

Other processes included an orientation process for all new intending students, several noho (staying on site) throughout the year for supporting doctoral writing, attendances at conferences, seminars and writing workshops to support students' needs. A key element of the doctoral program was the high level of interaction with other indigenous graduate students and scholars internationally. In 2010, doctoral students attended and presented at international conferences as part of an international outreach and the School of Indigenous Graduate Studies also hosted and supported students to attend the national MAI conference in 2011 where two groups of indigenous students from Australia attended. Such attendances continued until Covid 19 intervened in 2020.

However, there was a problem with the PhD program one of control exerted over the structure and underlying philosophies of the program, which had its roots in the "colonial sites for the assimilation of British national culture", the very sites that the Wānanga was contesting and struggling against. So, while Te Whare Wānanga o Awānuiārangi gained approval to operate the PhD program, that very program sat within a certain mindset that did not allow Māori students to be indigenous in their ways of thinking and knowing, and which expected conformity to University set agenda. While as an institution we struggled to be as good as the universities when it came to the doctoral program, the truth of the matter was, that was never a "level playing field" that we could engage on or could hope to change to be conducive to indigenous ways of thinking: tinkering with the system did not change it!

Developing an indigenous doctoral program (step 3)

It was time to rethink the whole nature of what came to count as an Indigenous Doctorate. That rethinking was escalated in 2011, when we were approached by Professor Alan Parker of Chippewa Cree (Rocky Boy's Reservation in Montana), the co-coordinator for the Master of Public Administration, Evergreen College in Olympia, Washington State who retired July 2012. While visiting the Wānanga, Professor Parker and I had an opportune moment to discuss Graduate programmes and he proposed that Te Whare Wānanga o Awanuiārangī should meet with graduates from the Master of Public Administration Degree to establish if the students could be considered for enrollment into the Doctor of Philosophy.

Initial discussions with potential students occurred at the end of 2011. In those discussions (and in considering some of the shortcomings of our PhD program), I began to think that our PhD program was not going to be a good match for these potential students for several reasons. Firstly, most of them had a Master's that prepared them for entry into a "taught" doctorate (which is the model in the United States) and that the base for their Masters (particularly in the research thesis/dissertation area) was not as strong as in the New Zealand program.

Secondly, New Zealand PhD programmes relies on self-direction and independent study, which I thought might end up potentially isolating the students (which had occurred to a certain degree with our own Māori students), made worse by the fact that they were in Washington State (and our team was based in New Zealand).

Thirdly, I was still not convinced that the PhD program could enable transformation for indigenous communities. Developments for change were reliant on the commitment of the student to create change, an aspect of research and doctoral studies that I was becoming more aware of and committed to. It was at this point that I started to think about a practical type of doctorate (a professional doctorate) that was quite different from anything offered in New Zealand and which had the potential to meet the requirements for transformation and change for communities.

My own doctorate for example (PhD), sits on a shelf, is referred to by students and colleagues but for the most part, gathers dust. That is not the type of situation I envisaged for our students. This professional doctorate would need to be niche driven, to achieve a number of objectives that the PhD program could not. In discussion with Dr. Parker, it was time then to get out into the communities to see what they needed and wanted.

Over the next year, Dr. Parker and I visited several tribal groups (in Washington State and later in Hawaii), met with their councils and various members to discuss the possibility of offering a doctoral program into Washington State and what that might look like. The tribe's involved in that discussion were Lummi, Swinomish, Tulalip, Puyallup and Chehalis. In those discussions, there were some extremely forthright conversations about the nature of doctoral studies in Washington State and two main points were made that highlighted some of the concerns tribal members had about the doctoral programmes available to their community members.

Predominantly they spoke of their young people going off to university, gaining a doctorate and not returning because they were "seduced" by the academy. They noted that often these graduates were the only tribal person employed in a department (placing them at risk) with opportunities to engage in other activities and at other levels which the tribes could not compete against. The chances of them returning to work with and for their tribe was limited. Discussants asked if our doctoral program could keep their community members in the community?

A second area of discussion that required thinking through what a professional doctoral program might look like, related to communities highlighting that some tribal graduates returned to work with their communities having learned "strange ways of knowing, and doing strange things". Some tribal members were quite blunt about pointing out that these types of graduates were not helpful for community and tribal developments.

As discussions progressed with tribal communities, it was confirmed in my thinking, that a straight-out research doctorate (PhD) was not where we would be going and that a Professional "taught" doctorate (with a significant research component) was the way that we should be heading.

As tribal communities aired their concerns and raised issues, we responded (always "face to face") which required many meetings, discussions and planning. The role of Dr. Parker in this process was integral: his relationship with many of the Chairs of the tribal councils stemmed from his previously having served on the Washington State Gambling Commission for five years and he was known to many of the tribes throughout Washington State through that role. He was highly respected and his support of our endeavors to offer an Indigenous doctoral program was an endorsement of what we were attempting to achieve. I always admired that whenever we turned up at any of the tribal offices, his ability to meet with the Chairs (or educational representative) in those Tribes, occurred very quickly.

To seek further support for a doctoral program, we also had conversations with Evergreen College and North-West Indian College (Lummi territory). This was to gauge possibilities for relationships moving forward, that later extended into conversations (and a memorandum of understanding) with the University of Washington (Tacoma).

We were also joined by Professor Margie Maaka (University of Hawaii) who was interested in the development of a specific indigenous type of doctoral program for Hawaiian students. Her contacts with other indigenous educators (throughout Hawaii and Washington State) were to prove invaluable in the thinking phases of a new doctoral program. Our times together meeting with tribes, potential students and communities enabled the three of us to talk and think through this intended new development. We were also fortunate to later draw on the knowledge and expertise of Dr. Sharon Parker who worked at the University of Washington in Tacoma, who was able to provide much of the background information to the workings of doctoral studies in Washington State.

New Zealand accreditation and approval of the program (step 4)

Mid 2013, I began in earnest to develop and write up the Professional Doctorate taking into consideration the discussions and points outlined by the Washington State Tribes, and taking into consideration evaluations, comments and feedback to our current PhD Program within Aotearoa New Zealand and iwi (tribal) groups. My experiences with the PhD program (and what did not work well for our students) became an important part of thinking through what the new doctoral program would look like. This new doctorate had to be “niche” specific, created and written with a precise purpose to assist desired outcomes of communities and tribes, unlike the PhD which focuses on individual students and relies on their own personal commitment to implementing their research findings.

What evolved over four months, was a comprehensive program that took into account many of the issues, aspirations and desires of those Indigenous Communities who had indicated their support for such an endeavor. The program also met the academic criteria required for a Doctoral Program in New Zealand and was accredited (approved for delivery) by our National Accreditation organization (New Zealand Qualification Authority) in December 2013. It was called The Doctor of Indigenous Development and Advancement (with a second program available for Māori students called The Doctor of Māori Development and Advancement). The name was important because it signaled the intent of the Degree. Both programmes were first offered in 2014 with the Indigenous focus for Washington State, and both the Indigenous and Māori focus within New Zealand. There are several unique philosophical and operational aspects of the program outlined here that were put into place as a result of the discussions with tribal communities.

For example, students’ intending to enroll into the program were required to be supported and endorsed by their tribe/iwi in their endeavor to undertake their research. This was to such an extent that community members and tribal councils could (in negotiation with students) be involved in various stages of the students’ enrollments and/or study. In Washington State, this negotiation culminated in scholarships for students’, included advice on topic selection and (once research proposals were completed) ethical approval. The result is that students are tied to their research and communities because they literally must seek permission and support to do their research from tribal members and the council before enrollments are accepted. This also keeps them in the community to do their research.

The doctoral topics that students selected, had to also be relevant to the tribe that the student affiliated to. Students were asked to consider developing models, structures and frameworks to assist their communities to change. As a result, topics focused on what could work, (rather than what does not work - there is enough of this type of research in existence), thus enabling the potential for their research to be transformative and to create change.

Significantly, the first two years of the program focused on coursework. In that time and through those courses (Literature Review, Methodology, Methods and Research Proposals), students were exposed to indigenous theories, practices, research, other indigenous academics and community which addressed concerns about students learning “strange ways of knowing and doing things”. In the first two years, students were assisted to rethink how they had come to think about and know about research. For many students this represented a significant breaking away from that colonizing gaze that previous study had trained into them: a western perspective about “what counted as research” (Johnston, 1998). This decolonization process was an important aspect of the first two years in the program.

For example, one student who was writing a revisionist history of her tribe initially began by wanting to engage with the non-native anthropologists and historians (western perspectives), which would have set her whole research along a very different pathway. Her work would have acknowledged those accounts as the valid accounts (even if she were just critiquing them). As her supervisor, my conversations with her included questions like why would you do that, why would you privilege their voices? Instead, she began with the narratives and stories of her elders placing their knowledge at the forefront of her research, which created a much more powerful account for her tribe’s account of their history, then what an analysis of non-native accounts would have produced. Her whole dissertation (Dupuis, 2018) is her tribe’s story of how they came to be in the place they are located, their relationship with other tribes and an in-depth acknowledgment of their own cultural practices. I advised her to either place the non-native accounts at the end of her work and pick them up there (if she felt the need to) or let them drop off altogether. Such conversations enabled a re-centering away from western and colonial frameworks for the research, to clearly acknowledging and centering indigenous one’s.

Students were encouraged to think in terms of indigenous methodologies and practices in their work. This has potentially been the most exciting part of their program to date, seeing how they integrate their own cultural ways of knowing and doing into the very core of undertaking the research, which influences the research framework and how they collect and interpret their data and information.

Another student for example (Cultee, 2020), spoke to a specific practice around oral traditions and how in her working with elders, she was not allowed to tape or write down what she was told. Instead, she had to memorize the information and give it back (correctly) before she was given new information. As a result, she spoke of how her ability to “remember” increased over the time she was engaging in the research and this practice enabled her to challenge biased ideas about the simplicity associated with oral traditions and remembering. Her research framework is from her own tribe’s knowledge framework.

In their final term of coursework, students prepare a research proposal and deliver their first oral presentation about their research. Whanau (family) and tribal members are encouraged to attend those presentations and ask questions/pass comments. The presentation is also assessed by a panel of three academics that can include (in the case of Washington State students) indigenous academics from Washington State. The role of this oral, is at one level to gain support (and critical feedback) for the research

that students are undertaking, but at another level for them to be accountable to those whom the research intends to include by talking through what the research is about.

The second oral presentation is in “defense” of their research however, we see this more as a formality with the expectation that because of the processes leading up to that oral, students would pass through this stage as a matter of process. This second oral also enabled students to disseminate their research findings back to their communities and participants who once again, could attend the oral presentation. Communities get to “witness” the research and students are enabled to feed-back their findings as a part of their reciprocity and accountability to their communities for what they have produced.

Our accountability as in indigenous institution (Te Whare Wānanga o Awanuiārangi) came at other levels that included operational. In Washington State for example, students attended classes for the coursework and our teaching/learning spaces accommodation etc., were hosted by their tribes. Students would ask that their next class be held in their territory and this helped to build up a rapport with tribes, while also enabling us to give back (financially) to those tribes who supported our program. The importance also of doing this, was that often we would be asked to give “a talk” on a whole range of different issues to the broader community or education groups and so reciprocity (and accountability to those tribes) came in many different forms.

From November 2011, we met with 47 potential candidates however, the interest in the program extended to include students from Washington State University, Hawaii and University of British Columbia. Word spread about the program but there were difficulties that had to be worked through. Most significantly the availability of funding for our international students precluded many from participating because of federal rules about funding to external (New Zealand) organizations. Some tribes found ways to provide scholarships and there was many a tribal policy change to enable students to enroll into our doctoral program.

Currently, Covid 19 and the impact on our students both within New Zealand and Washington State, has to a certain extent, halted the Professional Doctorate because of the impact on students’ communities. Although we moved to an online delivery in 2020, this is not in keeping with some of the philosophy of meeting “face” to “face” and the support that is generated by being together in the same room. We continue to work through those concerns.

The program is still evolving as has my role in it. I shifted from being the developer of the program, negotiator with communities and tribes, administrator of the students and institutional requirements, teacher/learner with the students (and their communities) coordinator (with overall oversight) to now being that of a supervisor, colleague and mentor. Others now guide and shape the program.

I have supervised 3 students to completion in Washington State and several in New Zealand and I acknowledge in closing their willingness to be involved in the Professional Doctoral Program and for persevering while we worked through the details. As a part of that acknowledgment, I include here the words on our website from Dr. Marla Conwell, our first international indigenous graduate who graduated in 2018 (Chehalis Confederated Tribes) and who also received Te Onehou Eliza Phillis Award for Outstanding Iwi (Tribal) Research.

She states: I completed my Doctorate as an international doctoral candidate based in my home city of Olympia in Washington, USA. After my Masters, I had not intended to pursue a doctorate initially but was compelled to join because of the Awanuiārangi Indigenous Studies program. I have been blessed with the opportunity to further my education by my Chehalis Tribe. This doctorate was the perfect way to repay that faith in me. I focused on indigenous language revitalization—a personal passion of mine ... I wanted to contribute to the indigenous language revitalization field in the hope of assisting indigenous groups who want to revitalize their own languages.

My experience was simply amazing! As an international student based in the United States, I was fortunate that we met for week-long classes each quarter in addition to the online component, and my cohort maintained frequent contact outside of class for study sessions and writing. One of the benefits of studying with Awanuiārangi was the focus on decolonization and indigenous ways of knowing. This was life affirming. It caused me to re-evaluate my life and experiences as well as develop my critical thinking skills and approach to the colonized education and life systems in which we are often mired.

Would I recommend this program to other international scholars? Absolutely—it is one of the greatest accomplishments of my life. I am one of the very first doctors in both my family and my Tribe. This program is amazing, and I wholeheartedly recommend it to all indigenous people and their allies (<https://www.Wānanga.ac.nz/experience/our-students/marla-conwell-ida/>).

Acknowledgment

The following year Dr. Conwell’s twin sister Dr. Mary Dupuis graduated and received the Emeritus Professor Roger Green, ONZM Award for Top Doctoral Thesis.

In following contemporary Indigenous ways of being, I share the following self-location statement to illuminate where my perspective comes from, my communities of accountability, and to be mindful that Shawn Wilson's concept of relationality (2008) is established. Though there are critiques of lengthy introductions (Gone, 2014), I hope that it is received as a presentation of my predispositions and perspective relevant to the passing of indigenous knowledge, in this case within the context of teaching at the graduate level at a predominately White institution (PWI).

Given by my grandfather Hokšína Oyágambisa.¹ I grew up with the Nakóna name Tataga Togáhe. I am a member of the Napéši² (Personal Communication Minerva Allen), Húdešana³ (Personal communication, Sweeney Windchief Sr.) and Wadópana⁴ (Personal communication, Larry Wetsit) clans of the Nakóna. In full disclosure, I was raised primarily off reservation, but feel privileged in that my parents spent the time and money to travel back to the Fort Peck Reservation in Northern Montana, in the summers. The highlights of my upbringing were within the context of family gatherings. As an enrolled Assiniboiné member of the Fort Peck tribes who grew up primarily off reservation, I now serve as an associate professor at a PWI located relatively close to, but ontologically distant from, the Fort Peck Indian Reservation. My intention is to share how this upbringing influences teaching that is inclusive of an Indigenous paradigm, even though it is at a PWI, where often students are not Indigenous but may find themselves engaging Indigenous community contexts, particularly through Montana constitutional law known as Indian Education For All (IEFA).

Indian education

In 1972, the Montana constitutional convention met to revise the state's constitution to include tribal peoples in the state. Though made official in 1999 it was not until 2005 that there was funding committed to the initiative. As a result of this funding there was a commitment, a structure for curriculum development, and dedicated personnel to train educators on the implementation of IEFA (Carjuzaa et al., 2010; Starnes, 2006). Though the majority of work has been at the primary and secondary levels, it is important to recognize that IEFA is not limited to the K-12 arena as stated by Carjuzaa:

OPI has developed several multimedia and on-line IEFA resources. Regional professional development allows many Montana teachers to access training tailored to local context. OPI Indian Education staff present on-site workshops for public schools, colleges, universities and educational organizations statewide (p. 196).

Therefor it is admissible to take the intent of IEFA and implement it into graduate education According to IEFA is focused on seven essential understandings. These include:

¹Assiniboiné name for Joe Day, Translation; "The boy everybody talks about".

²"Stakes themselves out" people through my paternal grandfather and father.

³"Red Bottom People" band of Assiniboiné on my grandmother's side.

⁴Assiniboiné band that settled on the Fort Peck Reservation, called canoe paddlers, Canoe band; Paddlers, band of Assiniboiné living around Wolf Point, MT.

- A recognition of tribal diversity
- A recognition of indigenous identity variability
- Understanding that there is an often missed discourse on pre-“discovery”
- Treaty processes are different for different tribal communities
- Federal policy is enacted, and the result extends beyond a discourse of tribal peoples being seen as wards of the state
- Indigenous curriculum implementation is to be considered using the most local tribes perspective
- The concept of tribal sovereignty is implemented differently among Montana’s tribal communities

In an effort to bring about culturally sustaining teaching (Paris, 2012) at the graduate school level, the purpose of this chapter is to share a teaching methodology that incorporates contemporary Indigenous knowledge while simultaneously incorporating a professionalization process that has the potential to inform what students might expect as they move from graduate programs into the field of academia and or academic administration. As students move from being consumers of knowledge and information in the undergraduate and professional realms, to providers of knowledge and information as graduate students (Neary and Winn, 2009), it is essential to foster development toward scholarship that aligns with local laws which subsequently provides the opportunity to include Indigenous values. (Badwound and Tierney, 1988; Harris and Wasilewski, 2004; Jackson, 2006; Kirkness and Barnhardt, 1991; Verbos et al., 2011), that subsequently confound typical teaching styles at PWIs. In reflecting on the courses that I teach; the students are all graduate students in a graduate classroom setting, and at this stage, the attainment of knowledge and understanding necessitates responsibility and complexity and eventually provides a unique position to influence others.

Bicultural accountability

Typically, graduate students are charged to become the expert in their field. How this expertise is communicated is often not aligned with an Indigenous community value of being humble (Zimmerman, 2005). In addition to a strange immersion into the field they study while balancing cultural integrity, they are in the process of contributing to the theories they ascribe to and taking their teaching responsibilities seriously. Furthermore, many Indigenous graduate students also feel an internal responsibility of contributing to their own communities and the broader indigenous community. Brayboy states “Consistent with findings regarding undergraduate AI/AN students, many graduate students report pursuing higher education out of a desire to give back to or to serve their communities” (Brayboy et al., 2015, p. 265). This is complicated by the fact that aside from Indigenous studies and its many iterations, the scholarship that they engage in their intellectual development is almost certainly centered in a non-Indigenous paradigm. As a university teacher and Indigenous researcher, and it is my charge to facilitate learning in alignment with Indigenous values as opposed to teaching in way that is preformed and predetermined by non-Indigenous principles, that often removes students from the process of innovation. In the majority of the courses I teach, I have to understand that bicultural accountability is paramount to successful classroom innovation. This occurs in three specific ways; (1) by measuring “Proficiency” and “Growth” paradigms which does not assume students have the same kinds of cultural capital, (2) by using consensus, co-construction and co-ownership through an indigenously cognizant model in the development of the course, and (3) implementing a professionalization process that is accountable to the institution as students move into academia and administration.

Graduate school as a professionalization process

Because students arrive to different topic areas with various levels of knowledge, students’ first assignment is typically an “Initial Reflection”; a 1–2 page paper asking them to reflect on their current knowledge directly related to the approved student learning outcomes. Often the responses are based on the student’s experiential knowledge serving to establish microaffirmations (Davison and Rolón-Dow, 2018). For example, students are explicitly asked *not* to Google, use Wikipedia, or review the literature in an effort to assess where each student is located in relation to their knowledge of the course content. The final assignment for the class mirrors this first assignment though at this point, students are encouraged to look at their initial reflection and their assignments as they respond. This teaching approach is conscious of two primary measures, (1) topic proficiency and (2) a knowledge growth paradigm. Topic proficiency is measured by the students’ knowledge of the learning objectives in class assignments while knowledge growth is measured by comparing students’ “initial reflection” with their “final reflection”, showing the amount of growth that each individual student made during their experience in the course, in terms of (1) knowledge, (2) skills, and importantly (3) dispositions (Rosebrook and Larkin, 2003).

Course co-construction

The central pedagogical innovation I use in the facilitation of learning combines using andragogical principles (Knowels, 1996; Merriam, 2001) which are techniques used to teach adults that include self-directed leaning, self-evaluation, and the development of scholarly independence. These principles are paired with a modified version of the Indigenous Leaders Interactive System (ILIS™), “an issues

management process that affirms the value of diverse opinions, clarifies a group vision, and fosters ownership in the collective outcome” AIO. (n.d.) to co-construct students’ collective experiences in the courses I teach, and eventually an agreed upon syllabus for each class.

To begin this process students are presented with the approved student learning outcomes that are stated on the syllabus. The adjusted⁵ ILISTTM prompting question asked of students during the first class is “How will we prove that at the end of the semester that we have met these student learning outcomes?” All students participate in providing responses to this question until as a collective, we have exhausted student contributions. This process provides rigor, by giving students ownership of their course; develops strong working relationships through active listening and considering classmates’ opinions; and provides the contemporary relevance required for a pedagogically sound doctoral level course by including both everchanging learning tools that are available online as well as making Indigenous inquiry a viable option.

As a result of the list of contributions, students are asked to cluster responses that overlap, and consider the contributions in terms of a “Grade-able” product. Students are then asked to connect the responses to the specific learning outcomes of the course, and finally they are asked to vote for the assignments they feel would be the most beneficial to their learning. In order to avoid students’ irritation related to assignments, deadlines, and expectations, the course assignments that we agree upon on are then given point values and due dates, based on guided conversation making room for traditional and family responsibilities that are too often left out. This technique provides the students with the opportunity to actively invest in their own learning (and learning styles) to the course material while feeling empowered to develop how they will learn in a systematic and calculated way. Finally, it allows for students to consider the fact that Indigenous community calendars’ and the academic calendar are not the same, making room for traditional community gatherings allowing students to be “whole” people.

The final paper

In implementing this approach, I have learned that students need some guidance regarding a final product that reflects the professional expectations of academia. The solution is to provide a realistic situation that emulates the postgraduate reality of the dissemination of knowledge. The students are asked to develop academic products that align with institutional and professional structures that are currently in place, to include indigenous research associations such as the American Indigenous Research Association or the He Manawa Whenua/He Au Honua Indigenous Research Conference.

In order to complete their degree, students are at some point required to use analytical and critical thinking to compose a final dissertation, thesis, or some sort of capstone document. The “Final Paper” and related “Poster/Presentation” assignment gives students experience in writing a well-organized paper that is pertinent to their own professional and/or research interests connected to the course. Part of the process is their responsibility to conceptualize and organize the paper during the semester. These papers are completed in successive steps similar to those used in proposing research papers at professional conferences in the field of higher education.

The required format for final papers is reflective of those accepted at regional and national educational researchers’ conferences. Specifically included are those conferences the students are likely to attend; the Northern Rocky Mountain Educational Researchers Association (NRMERA), the Association for the Study of Higher Education (ASHE), and the American Educational Researchers Association (AERA), or the above-mentioned Indigenous research conferences. Papers typically require six components (1) Objectives or purpose; (2) Theoretical or conceptual framework; (3) Methods; (4) Data sources (5) Conclusions or Preliminary results; and (6) The significance of the study.

Connected to the final paper, I require students to prepare a presentation or poster highlighting the elements of their final papers. This opportunity supports professional development in terms of dynamic teaching and presentation skills. Ideally students in the classes I teach will be able to adjust and refine the papers and presentations from my courses and deliver them at regional or national conferences, to their own students, or back home within their own respective Indigenous communities. If indeed students have a paper accepted, we then must develop the presentations that they will be expected to give and find travel funding.

Presentations/posters

The presentation is typically 10–15 min in length to include extra time for questions and feedback in order to prepare students for the academic critique they may experience in the future while simultaneously developing critical thinking skills and collegiality. Students are encouraged to be dynamic in their presentations and are directed to avoid only reading from the text or other materials in their presentation slides and are encouraged to use the provided IT equipment we have available in our classroom which mirrors what might be available at conferences. In addition to assessing the student, the practical significance of this is to test presentations if indeed they are to make a public presentation.

⁵Adjusted primarily because we are not allotted the time to be as thoroughly as practiced by AIO.

Challenges

One of the challenges that I have been confronted with in using this approach is that the course is often experienced as lacking in organization. This has been reflected in student evaluations in the courses I teach. It has been my experience that very rarely are students given the opportunity to co-construct their own course and are often unaccustomed to taking responsibility for their own learning. Nonetheless, by illuminating the realities of the profession, and a gentle reminder in that they will one day be leaders in the field as either professionals/administrators or faculty members, a canned curriculum does little to provide accountability for reflective innovation related to Indigenous community values or ontologies. My goals in the future are to better illuminate those realities while providing opportunities for students to learn about themselves as aspiring scholars and professionals. In order to accomplish these goals, I want to require an out of class presentation or poster session as opposed to “suggesting” or “encouraging” it. It is my hope that this requirement will bring even more investment in their own scholarship. Furthermore, a community accountability component could be added so that students’ home communities are aware of what they are doing in their time away at University. This serves to communicate what the students’ potential community contribution might be upon returning home.

Accessibility

Over the years I have had students who were unable to attend classes for multiple reasons. Students with documented physical disabilities have been unable to attend my courses in person. Others lived out of town and consequently were unable drive to campus because of winter road closures. Moreover, some were in the later stages of pregnancy and had difficulties getting to the classroom. Rather than exclude these students from classes, I have instituted a personal policy that all of my classes will be broadcast via internet video technology using our institutions video technology platform, allowing for participation when otherwise they would not be able to attend. This practice facilitated the “Covid-19 transition”.

In a review of student feedback, the strongest area of my teaching (Impartiality on Grades and exams) can be credited to the professionalization process found within the pedagogy that I implement. Students papers are treated as if they were submitted to an academic journal. I review the papers in terms of commendations and recommendations related to (1) APA seventh Ed. formatting (2) Content (3) Context/Relevance (4) Readability, and (5) Plagiarism. Student presentations are reviewed in a “mock conference presentation” where I act as a panel discussant and the other students are either co-panelists, or audience members.

The second strongest component as articulated by the students’ ratings (Stimulation of interest) can be credited to being conscious of avoiding a “predicament of relevance” for students. This is accomplished by letting them choose the topics they work on over the course of the semester, inviting student work that connects to Indigenous community. The only caveat is that they are germane to the learning outcomes of the course. In short, they are able to complete papers and projects they are interested in and carry community relevance.

This pedagogy opens the door for Indigenous students to do community centered work. As a result, students are aligning their work with IEFA. This is not without some concern. One question that I grapple with is; In a graduate course at a PWI, the students’ work is within an Indigenous paradigm, what is appropriate to share in a classroom, and what is not? Often In-class disclosures are often related to Indigenous cultural and spiritual values to include community specific custom. I am challenged by discourse that connects to students’ community held knowledges that are very close to the students but are conceptualized within specific community contexts and not considered the same way in an academic setting. To be clear, I do not see the knowledge as being wrong, rather, Indigenous knowledge is typically held within Indigenous spaces that are held to an indigenous standard that some consider “not academic”. I am unsure, as of now, how to proceed when it feels like the student is disclosing and sharing community-held information outside the Indigenous community. While their stories, iterations and perspectives are (in my view) absolutely appropriate within the auspices of Indigenous community life, or even the tribal college setting, the fact remains; most of the time depending on the course, at PWIs the majority of students are not Indigenous students. This can be the case even in such courses as Indigenous Methodologies in Research, and Native American Studies courses. To share community held knowledge seems to give non-Indigenous students access to information that is potentially at risk of being mis-used and misappropriated.

Furthermore, I am often challenged by students who wonder why I am such a stickler to APA sixth Ed. formatting, particularly when the knowledge that they are sharing is community held and protected Indigenous knowledge. I see the reason for students’ frustration. Why would an Indigenous student, in an Indigenous methodologies class, taught by a professor who is from an Indigenous community, be required to share in a way that is bound by non-Indigenous rules? This question, which speaks to a well-articulated argument against Western/colonized paradigms is to be taken seriously. My response to these students’ frustrations reflects that their voice is important, needs to be heard, and may empower others. The significance of their knowledge may not impact as many people if it is not written in a way that can be made public.

Reflectively, I have wondered, both in my own scholarship, and in the courses that I teach, the very same sentiments. To take it one step further I have become critical of the commodification of knowledge so apparent in the knowledge economy. In short, the Indigenous scholar, at any level, has the same burdens as their non-Indigenous counterparts/colleagues, but they also have a simultaneously unique source of power and knowledge and additional related responsibilities to protect that knowledge and power.

Conclusion

In conclusion, this chapter seeks to honor Indigenous scholarship by first locating myself for the purpose of establishing perspective. Please consider that this is one way to facilitate learning within an Indigenous paradigm, though performed at a PWI. It is not the only way. In this process I make use of the IEFA initiative in the state of Montana in order to bring Indigenous methods to the classroom while considering bicultural accountability, developing professionalization, self-directed learning, and access for all. Lastly the challenges of over disclosure of Indigenous community knowledge, and the fact that we are operating in colonized systems does not align well with graduate education as we know it. Further research in these areas is welcome, as we move forward providing spaces that help students keep their Indigenous concepts of self, intact. It is my intention to improve student learning in a way that broadens and deepens, professionalism, an investment in one's own learning, and prepare all students for the challenges they face as future scholars and educational leaders with particular emphasis on safeguarding community knowledge while promoting and particularizing what it means to be an Indigenous learner. This can be accomplished through innovative teaching methods which include by concentrating on both proficiency and growth paradigms for each student, facilitating course consensus and co-construction, and finally implementing a process by which students are able to experience what they will encounter in their professional lives, regardless of physical ability or Indigenous self-location and related complexities.

The Center for Cross-Cultural Studies (CXCS) at the University of Alaska Fairbanks (UAF) was created in 1977 to address research, development, and instructional issues associated with educational policies, programs, and practices in culturally diverse contexts, with an emphasis on Indigenous Peoples worldwide, rural, and distance education.

CXCS was originally established in 1971 as the Center for Northern Educational Research (CNER) by action of the UA Board of Regents and with initial funding from the Ford Foundation. By 1977 the University had assumed full funding and CNER was merged with the Cross-Cultural Education Development Program to form the Center for Cross-Cultural Studies. CXCS was housed in the UAF College of Liberal Arts until Spring 2021. As of May 2021, CXCS is housed in the UAF College of Rural and Community Development (CRCD).

The research agenda for the center is established in cooperation with Native organizations, school districts, and state/federal agencies, with a focus on applied research that will benefit the people of Alaska. CXCS is structured to provide technical support and information to school districts, social service agencies, Native corporations, tribal governments, community colleges, and state and federal agencies in rural Alaska. This provides direction for the improvement of educational and professional development opportunities for rural Alaskans and a forum for the examination of Indigenous education and community development issues. The center also sponsors various state, national, and international seminars, conferences, and exchanges to bring people together around issues of concern to Alaska, the circumpolar North, and Indigenous people throughout the world. The Center houses the Alaska Native Knowledge Network (ANKN) and offers an M.A. and Ph.D. in Indigenous Studies with an emphasis on Indigenous knowledge and Indigenous ways of knowing. All faculty and students interested in issues associated with Indigenous knowledge systems, cultural diversity, and education are encouraged to participate in and contribute to the efforts of the center.

The Alaska Native Knowledge Network was established in 1995 through the Alaska Rural Systemic Initiative (AKRSI) (Hill et al., 2006). AKRSI was founded 1995–2005 to implement Native ways of learning and teaching in rural Alaska through various initiatives with about twenty school districts statewide. “The underlying purpose of these efforts has been to implement a set of research-based initiatives to systematically document the Indigenous knowledge systems of Alaska Native people and to develop pedagogical practices and school curricula that appropriately incorporate Indigenous knowledge and ways of knowing into the formal education system” (Barnhardt and Kawagley, 2005).

ANKN was established to become “a culturally based curriculum resources clearinghouse established to disseminate the information and materials that are being developed and accumulated as the AKRSI initiatives are implemented throughout rural Alaska” (Barnhardt and Kawagley, 1999). Native ways of knowing resources have been implemented in a variety of ways throughout Alaska. ANKN was developed to become a repository and distribution of various ways of teaching and learning:

In 1995 the University of Alaska Fairbanks (UAF) in collaboration with the Alaska Federation of Natives established the Alaska Native Knowledge Network (ANKN) to share and promote the exchange of cultural resources and knowledge among Indigenous communities throughout Alaska and beyond.

Topkok (2014, p. 143).

ANKN is a website and a clearinghouse that constitutes a part of the Center for Cross-Cultural Studies. ANKN serves as a resource for compiling and exchanging information related to Alaska Native knowledge systems and ways of knowing. It has been established to assist Native people, government agencies, educators, and the general public in gaining access to the knowledge base that Alaska Natives have acquired through cumulative experience over millennia.

While CXCS was founded in 1971 to serve Alaska Native research, development, and instructional issues; its two graduate programs include Indigenous collaboration worldwide. The cross-cultural studies programs prepare graduates capable of conducting basic and applied research on social, political, educational, economic, and cultural issues of concern to people and Indigenous communities.

The Master of Arts degree in Cross-Cultural Studies with an emphasis on Indigenous knowledge systems was approved by the UAF Board of Regents on March 9, 2001. The degree's title was changed in 2019 to a Master of Arts degree in Indigenous Studies to better reflect the nature of the curriculum. The program is designed to provide graduate students from various fields of interest an opportunity to pursue in-depth study focusing on the role and contributions of Indigenous knowledge in the contemporary world.

The M.A. degree program provides a means to expand our knowledge base in areas that have received only limited attention in the past, as well as to document and pass that knowledge on to future generations in a culturally sensitive way. The intent of the program is to incorporate and contribute to newly emerging bodies of scholarship that have much to offer in addressing critical needs of the state.

Graduates of the program are expected to bring greater depth and breadth of cultural understanding to many of the complex social issues and fields of endeavor that shape Alaska today, especially those involving cross-cultural considerations and utilizing Indigenous knowledge systems (e.g., education, ecological studies, natural resources, health care, community development, social services, justice, Native studies). Students are required to demonstrate their ability to work effectively with Indigenous people in their studies and to complete a final cultural documentation project in collaboration with knowledgeable Elders. The master's degree program in Cross-Cultural Studies/Indigenous Studies is housed in CXCS, and as of May 2021, thirty people had earned their master's degree with eight self-identifying as Alaska Native and four self-identifying as Indigenous outside Alaska.

In 2009, the doctoral degree program in Indigenous Studies was established and continues to be housed in CXCS. The Ph.D. in Indigenous Studies draws upon long-standing academic and research capabilities at UAF to offer an integrated, cross-disciplinary course of advanced graduate study. Native peoples in Alaska have usually been the subjects of research rather than the ones responsible for conducting it. However, the role of Alaska Natives in research is changing due to a concerted effort on the part of the University of Alaska and Native people themselves to develop new programs aimed at recruiting and preparing Native scholars in all academic fields who can take on leadership roles and bring an Indigenous perspective to the policy arenas at the local, state, national, and international levels.

The interdisciplinary Ph.D. program in Indigenous Studies is sponsored by the UAF Graduate School in collaboration with the Department of Alaska Native Studies and Rural Development (DANSRD), the Alaska Native Language Center (ANLC), the College of Liberal Arts (CLA), the School of Education (SOE), and the College of Rural and Community Development (CRCDD). The program consists of a common core curriculum that all students complete, coupled with six thematic specialty areas from which students choose a concentration:

- Indigenous Studies and Research
- Indigenous Knowledge Systems
- Indigenous Education and Pedagogy
- Indigenous Languages
- Indigenous Leadership
- Indigenous Sustainability

The Indigenous Studies and Research concentration provides the programmatic infrastructure for advanced, in-depth, interdisciplinary graduate studies and research in academic fields related to the role of Indigenous knowledge and ways of knowing in the contemporary world. This will provide students focusing on this concentration area to provide a venue to sponsor state, national and international seminars, conferences, exchanges, and comparative research programs that bring people together around issues of concern to Alaska, the circumpolar North, and Indigenous people throughout the world. Below is an abstract from one of our graduates from the Indigenous Studies Ph.D. program with a concentration in Indigenous Studies and Research. Dr. Norma Shorty's title of her dissertation is, "Inland Tlingit of Teslin, Yukon: Gaanax.ádi and Kookhittaán Clan Origin Stories for the Immediate and Clan Family of Emma Joanne Shorty (Nee Sidney)."

The purpose of my research is to learn the story of Mother's clan, and to document the processes of gathering knowledge about the clan connections between the Gaanax.ádi and Kookhittaán from Teslin, Yukon, Canada. The objective of this thesis is to document the stories and the story gathering processes of published and private holdings on my Mother's clan stories. The study includes published literature and non-Indigenous historians and oral history reviews, especially on those who have knowledge about the Kookhittaán and Gaanax.ádi clans and have connections to the Inland Tlingit from Teslin, Yukon. This Indigenous-led research focuses on my mother and her clan stories. I am an insider and an outsider to my culture. From an insider perspective I am privileged to hear, to learn, and to retell Mother's maternal clan stories. As a result of this research, Tlingit ways of documenting history are discovered and Tlingit research (literacy) frameworks are revealed. I learned that the Kookhittaán and Gaanax.ádi clans are one. Our oral history is validated by face paint designs, petroglyphs and clan shirt designs. In their published work some non-Indigenous ethnographers made changes to words and designs which distorted the Indigenous record. This dissertation compares all possible information sources showing the heavier

weight of evidence is provided by available Indigenous sources. Colonization has greatly impacted the perpetuation of Indigenous knowledge systems by referring to Indigenous knowledge as “traditional” because the term tradition conjures up images of living in the past.

Shorty (2015).

The Indigenous Knowledge Systems concentration contributes to and taps into newly emerging bodies of academic scholarship that address the role of Indigenous knowledge systems in fields such as ecological studies, natural resources management, health care, education, language revitalization, community development, social services, justice, and Native studies. Students focusing on this concentration area will compare and analyze the epistemological properties, worldviews, and modes of transmission associated with various Indigenous knowledge systems. Below is an abstract from the first graduate from the Indigenous Studies Ph.D. program with a concentration in Indigenous Knowledge Systems. Dr. Theresa Arevgaq John’s title of her dissertation is, “Yuraryarput Kangiit-llu: Our Ways of Dance and Their Meanings.”

The first purpose of this study is to describe the categories of dance. The second purpose is to describe how Yup’ik music and dance has played a functional role in organizing and maintaining various societal infrastructures (kinship, social, political, subsistence/economic, and spiritual) within the Yup’ik culture. This study seeks to further understand this role and how it has evolved over time.

The study utilizes an ethnographic methodology that includes historical and contemporary perspectives to describe Yup’ik music and dance categories and to explain how dance serves to organize various aspects of Yup’ik culture and societal infrastructure. Data includes interviews from Yup’ik elders and adults, fieldnotes, research journal entries, digital recordings, photographs, and observations of Yup’ik immersion school performers and rural community cultural events such as the Cama-i Festival.

The study suggests that Yup’ik dance and categories are important elements of the multiple cyclic rituals. It adds to the present literature revealing that there are twenty different dance types and categories, and many of the rituals are lost except for the ciuqitet (common dances), nangereciyaraq (the first dance), and iluriuracraq (teasing dance) dances.

The study also suggests that dancing is an essential part of the Yup’ik social infrastructure and that dancing is integral to the social system. This is demonstrated through six themes: Kinship, Physical/Mental Health, Form of Prayer, Spiritual Enlightenment, Leadership, and Teasing.

I also argue that there is connectedness in dance, music, and stories that are part of our yuuyaraq (epistemic worldview). Yuuyaraq is defined as a way of being a human or an absolute unified social web. This web is represented in our social infrastructures of kinship, health/physical and mental, form of prayer/rituals, spiritual enlightenment, leadership, and teasing. There is a relationship in storytelling genres in dance and oral stories that represent people’s historical and contemporary accounts, describing their social, cultural, and subsistence lifestyle. Interview participant data suggest these connections still exist in our society today.

John (2010).

The Indigenous Education and Pedagogy concentration provides an opportunity for students to engage in the comparative study of issues associated with the education of Indigenous peoples and communities with an emphasis on the role of language and culture through a review of educational practices, pedagogies, and theories that have emerged from a variety of sources. Students focusing on this concentration will demonstrate a greater understanding about the role of Indigenous culture and language in cognitive, social, psychological, spiritual, and physical well-being. Below is an abstract from a graduate in the Indigenous Studies program with a concentration in Indigenous Education and Pedagogy. Dr. Charleen Fisher’s title of her dissertation is, “Diideets’ii In Our Pathway (In Our Future): Gwich’in Educational Philosophy and transformative Praxis in K-12 Education.”

Gwich’in pedagogy is largely undocumented in Western academia. Gwich’in epistemology includes holistic perspectives on all Western content areas and crosses the usual segmented knowledge genres. Intergenerational transmission of Gwich’in knowledge occurs in many places including the natural environment, with long-standing cultural ties to place. Gwich’in pedagogy is relational, place-based, holistic, cooperative, purposeful, and subjective. Gwich’in gaagwidandaii, or communal knowledge, predates the inception of many world societies. Gwich’in concepts presented in this paper will include the introduction of a framework called Kheegwadadhaak’a, translated to mean, “We just keep the fire going.” This framework is a visualization. Important concepts of Gwich’in pedagogy include traditional ideas of assessments or standards using the phrases nil’ee t’ah’in and ch’aadaii, both meaning that someone has a natural talent or is adept at something, for girls and boys, respectively. Learning, or gik’yanjii in Gwich’in, also means “to find out, notice or sense.” This comprehension includes a deep, contextual understanding of traditional Gwich’in knowledge. The three types of Gwich’in knowledge are gaagwidandaii, gihk’agwagwaanjik, and gaatr’oahitan. These translate as “collectively known, individually learned, and taught knowledge,” respectively. Gwich’in have a complex and relational pedagogy. This pedagogy attempts to achieve contextuality, or duulee ginlii, which translates as “proficiency, agility, ability to do almost anything, being extremely good at anything they do, or overall ‘sharpness’ in life.” This process is importantly both a communal and personal journey.

Fisher (2018).

The Indigenous Language concentration strives to reinforce an Indigenous identity that is dependent on the language and culture, prepares the student for success in the world, and leads to acceptance at home. The concentration is based on the philosophy that a strong command of an Indigenous language leads to an understanding of Indigenous ways of life, the world around us, and our place in it. Below is an abstract from a graduate of the Indigenous Studies Ph.D. program with a concentration in Indigenous Language. Dr. Alisha Drabek's title of her dissertation is, "Liitukut Sugpiat'stun (We Are Learning How To Be Real People): Exploring Kodiak Alutiiq Literature Through Core Values."

The decline of Kodiak Alutiiq oral tradition practices and limited awareness or understanding of archived stories has kept them from being integrated into school curriculum. This study catalogs an anthology of archived Alutiiq literature documented since 1804 and provides an historical and values-based analysis of Alutiiq literature, focused on the educational significance of stories as tools for individual and community wellbeing. The study offers an exploration of values, worldview and knowledge embedded in Alutiiq stories. It also provides a history of colonial impacts on Alutiiq education and an in-depth study of the early colonial observers and ethnographers who collected Alutiiq oral literature, clarifying the context in which the stories have been retold or framed. Collections of traditional Indigenous literatures are valuable on many levels. This collection is of historical and personal significance for local Kodiak Alutiiq tribal members' identity as it makes these resources more accessible for community members and educators, and therefore accessible to younger and future generations. The conclusion also provides recommendations for next steps for developing curriculum and revitalizing Alutiiq oral traditions. The book is intended to contribute to an understanding of the evolution of cultural traditions in Alaska, and to serve as a model for similar cultural reclamation and education efforts.

Drabek (2012).

The Indigenous Leadership concentration prepares graduates who are capable of conducting basic and applied research on social, political, educational, economic and cultural issues of concern to people and communities in Indigenous communities. Students focusing on this concentration area will expand the pool of knowledgeable and highly skilled Alaskans who can assume leadership and technical positions with public and private sector organizations, including universities, school districts, social service agencies, Native corporations, tribal governments, and state and federal agencies in Alaska and beyond. Below is an abstract from a graduate from the Indigenous Studies Ph.D. program with a concentration in Indigenous Leadership. Dr. Pearl Kiyawn Brower's title of her dissertation is, "Tumitchiat: Iñuqqaat Aullarrisiatun Ilisaġviit—A New Pathway: Indigenous Leadership in Higher Education."

After centuries of colonization and assimilation policies in education, Indigenous people across our world are making commitments to nurture the next generation of Indigenous leaders. One area of focus is on Indigenous leadership through various forms of Higher Education. This dissertation supports the need for Indigenous leadership programs that have a foundation in Indigenous ways of knowing and learning and suggests a definition of what Indigenous leadership embodies. Specific Indigenous leadership programs are described.

Within the United States, tribal colleges are unique entities, but they share the same goals. These institutions create opportunities for hope and sustained Indigenous self-determination through their students, who are the next generation of Indigenous leaders. A broad review of tribal colleges is presented here. Then a particular tribal college, Ilisaġvik College, located in Barrow, Alaska, is discussed in more detail. The research also illuminates circumstances at University of Hawai'i (UH), a settler-colonial institution, that has recently decided to become a Native Hawaiian (NH) serving institution. How is this new responsibility viewed by UH's Indigenous leaders? I conclude with an overview and syllabus for an Arctic Indigenous leadership program to be implemented at Ilisaġvik College. The intent is to provide a path that others may use to create their own programs to meet their Indigenous communities' needs.

Brower (2016).

The Indigenous Sustainability concentration is concerned with the social, cultural, and physical well-being of Indigenous communities at the present and into the future, in part by understanding the changes of the past. Students focusing on this concentration area will explore interdisciplinary topics from a systems perspective that holistically examine the interactions between food, health, education, economic, and political subsystems, within a historical context. Knowledge sources for sustainability are not limited to a single cultural or ideological perspective, and new ideas and experiences concerning issues of sustainability are taken into consideration. The concept of sustainability is of growing concern to many academic disciplines; new course offerings are regularly being developed across the University of Alaska system, and students interested in this concentration area will have the opportunity to work closely with their graduate committee to find and select the courses most relevant to their individual studies. Below is an abstract from a graduate of the Indigenous Studies Ph.D. program with a concentration in Indigenous Sustainability. Dr. Heather Sauyaq Gordon's title of her dissertation is, "Self-Determination, Sustainability, and Wellbeing in the Alaska Native Community of Ninilchik."

Alaska Natives are a diverse group of people with different language groups and over 200 tribes. We have a history of colonization and are still a colonized people, but through all this, we strive for wellness for our people. This paper begins with an explanation of historical trauma, development, and the lack of fate control Alaska Native people experience. The literature review explains how colonization can negatively impact the colonized and details international, federal, and Alaska state law and court cases having to do with Indigenous sovereignty and self-determination. In this project the researcher works with the Ninilchik Village Tribe of Ninilchik, Alaska, to explore how community members utilize self-determination, either

individually and/or as a group, to achieve individual, community, and tribal sustainability and wellbeing. This project uses the method of ethnographic futures research to conduct scenarios about the future. The researcher conducted 30 interviews about three possible futures: the optimistic, pessimistic, and most likely, and followed the interviews with four focus groups to discuss the interview results. The results were coded through grounded theory in NVivo analysis software and compared with: (a) the Capabilities Approach, (b) Self-Determination Theory, (c) social science development theories of Dependency and World Systems, and (d) the Elements of Development Model. The Capabilities Approach and Self-Development Theory explain the links between self-determination and wellbeing. Dependency and World Systems Theories explain the importance of local self-determination for development. Finally, the Elements of Development Model provides an outline for different types of self-determining actions. The project analyzes Arctic wellbeing indicators and developed indicators of sustainability and wellbeing. The project results demonstrate what community members think that individuals, the community, and the tribe can do to improve sustainability and wellbeing in Ninilchik, and how to achieve those goals through self-determining actions. The dissemination document serves as the start to a 20-year strategic plan. This type of research demonstrates how tribes can address the results of historical trauma and take control of their fate through self-determination. The next steps in research would be asset mapping and capacity-building projects to work with the data and benefit the community.

Gordon (2019).

Ph.D. students participate in research activities across a variety of academic disciplines and applied fields at UAF. They are encouraged to engage in comparative studies with other Indigenous peoples around the world and to focus their dissertation research on issues of relevance to Alaska and the Arctic. Using the Interdisciplinary Ph.D. model of academic assignment, students' home-base is in the school or college of their major advisor or chair of their committee.

In collaboration with the graduate committee, each student develops a program of coursework and research that produces a unique intellectual contribution to the applied fields associated with Indigenous Studies. Students elect to focus on one of the six thematic specialty areas, or they may choose in collaboration with their graduate committee to draw on multiple themes to develop their own areas of study and dissertation research.

The Ph.D. Program in Indigenous Studies integrates the tools and approaches of the natural and social sciences in a cross-cultural and interdisciplinary framework for analysis to better understand the emerging dynamic between Indigenous knowledge systems, Western science, and higher education. We focus on the interface between Indigenous knowledge and science on an international scale, with opportunities for collaboration among Indigenous peoples statewide, nationally, and internationally. It also draws and builds upon past and current initiatives that seek to utilize Indigenous knowledge to strengthen the curriculum and pedagogical practices in education.

With numerous research initiatives currently in various stages of development and implementation around the world, there is an unprecedented window of opportunity to open new channels of communication between scientists, policymakers, and Indigenous communities, particularly as they relate to those research activities that are of the most consequence to Indigenous peoples (e.g., effects of climate change, environmental degradation, contaminants and subsistence resources, health and nutrition, bio/cultural diversity, Arctic observation networks, natural resource management, economic development, resilience and adaptation, community viability, cultural sustainability, language and education).

To the extent that there are potentially competing bodies of knowledge (Indigenous and Western) that have bearing on a comprehensive understanding of particular research initiatives associated with Indigenous-related themes, we offer opportunities for Indigenous Studies Ph.D. students to be embedded with ongoing research initiatives to contribute to and learn from the research process. In addition to conducting research on the inner dynamics of Indigenous knowledge systems, the Ph.D. students also examine the interplay between Indigenous and Western knowledge systems, particularly as it relates to scientific processes of knowledge construction and utilization. As of May 2021, there were 24 people who earned a doctoral degree in Indigenous Studies with 13 self-identifying as Alaska Native and 5 self-identifying as Indigenous outside of Alaska.

Alaska has at least 21 distinct ethnolinguistic Indigenous groups, and hundreds of village-based Indigenous communities. Both the master's and doctoral Indigenous Studies programs include Indigenous students statewide, nationally, and internationally. While a majority of the Indigenous Studies students are from Alaska, there are/have been students from the continental United States, Hawai'i, Guam, Canada, Mexico, (South) Korea, and other areas; and students from Japan, Ghana, Zimbabwe, Macedonia, Pakistan, Azerbaijan, Greece, Germany, Norway, the Netherlands, Denmark, Finland, and Switzerland have been enrolled in our classes.

CXCS faculty

Dr. Sean Asikluk Topkok is Iñupiaq, Sámi, Kven, Irish, and Norwegian. Asikluk is a tenured Associate Professor and Chair for the Center for Cross-Cultural Studies. He earned his doctorate in Indigenous Studies with a concentration in Indigenous Knowledge Systems. His research interests include multicultural and Indigenous education, decolonization and Indigenist methods and methodologies, working with communities to help them document their cultural heritages, and community well-being. His most recent research includes working with Nome residents (including Iñupiaq, St. Lawrence Island Yupik, and Central Yup'ik) about Arctic cruise tourism, implementing geoscience utilizing cultural knowledge systems in a Northwest Arctic Borough School District (mostly Iñupiaq residents), and interviewing Tlingit and Haida residents in Juneau utilizing Southeast Traditional Values dealing with the COVID pandemic. Asikluk is one of twenty-nine Iñupiaq scholars who earned a doctorate throughout history. He currently serves on the WINHEC Executive Board, World Indigenous Nations University (WINU) Pro-Vice Chancellor, University of the Arctic Avatitsinni (On Our Homelands—formerly known as the Indigenous Issues Committee), and other Indigenous committees. Asikluk started as a staff person for Alaska Native Knowledge Network and the Center for Cross-Cultural Studies in 1997. He created and taught Cultural Atlases as a Pedagogical Strategy for CXCS in 2006. Asikluk's institutional knowledge and being mentored by Drs. Ray Barnhardt and Angayuq Oscar Kawagley provide students through his and others' experiences.

Dr. Michael Koskey brings to the Center of Cross-Cultural Studies a diversity of life experiences and education that have focused on intercultural relations and understanding knowledge from local worldview perspectives. Born in Germany, raised in the American South, a Marine veteran of the Gulf War, and with research experience in Alaska, Siberia, and Belize, a lifelong interest in learning from local, especially Indigenous people, forms the basis of Koskey's cross-cultural scholarship. With an educational and professional background in anthropology, history, political economy, education, archeology, and international relations; Koskey brings a broad yet integrated perspective to his classes and research that is always rooted in local experiences and community interests. With this background, Koskey works to bridge cultures, by the exchange of knowledge, through mutual respect and understanding of one another's worldviews.

Dr. Theresa Arevgaq John is Yup'ik from Toksook Bay. Dr. John is a tenured Associate Professor in the Center for Cross-Cultural Studies at the University of Alaska Fairbanks. She received her Ph.D. in May 2010 from the UAF CXCS Indigenous Studies Program entitled Yuraryarput Kangiit-Illu: Our Ways of Dance and Their Meanings. Theresa is the first graduate of the Indigenous Studies Ph.D. program. President Obama selected Theresa to serve on the National Advisory Council on Indian Education in 2011. She co-authored a book entitled Yupiit Yuraryarit: Yup'ik Ways of Dancing that received a prestigious 2011 book of the year award from the Alaska State Library Association. Theresa has published academic articles in various academic agencies as well as local newspapers. Her professional interest areas include Alaska Native ceremonies and studies, Indigenous epistemology, ontology, ecology, cosmology, and worldview.

Mission statement

Our mission at the Center for Cross-Cultural Studies is the improvement of educational and professional development opportunities for Indigenous Peoples. We also serve as a forum for the examination of cross-cultural and Indigenous education and community development issues across the state, as well as the globe.

Through the interests of our students, our goal is to provide technical support and information to school districts, Native corporations, tribal governments, community organizations, and state and federal agencies serving Indigenous communities. Our Indigenous Ph.D. program is the highest Native Studies degree granting program in the state and combined with our MA program, we work hard to increase the recognition of Indigenous scholarship across a range of academic disciplines to best serve our students.

Values

As a reminder, the Center for Cross-Cultural Studies houses the Alaska Native Knowledge Network and the graduate programs in Indigenous Studies. We acknowledge that each 229 federally recognized Alaska tribes and Indigenous-recognized tribes have their own unique cultural values. [Roderick \(2008\)](#) states:

What these cultural groups share in common, however, are deeply-ingrained values, such as honoring the land and waters upon which life depends, having respect and reverence for fish and wildlife, valuing community over individuality, sharing with others, and respecting and learning survival skills and wisdom from Elders. Alaska Native cultural worldviews are holistic. Native cultures accept that everything in creation is connected, complex, dynamic, and in a constant state of flux. Alaska Native peoples have a deep and sophisticated qualitative understanding of the environment in which they live. This understanding comes from stories passed down for generations; it also comes from life experiences, learning from mentors beginning at a young age, observations of others in the community, and the guidance of Elders (p. 2).

CXCS serves Indigenous peoples internationally. In the *Alaska Standards for Culturally Responsive School* (also known as the *Alaska Cultural Standards*), under the Cultural Standards for Schools A(3), a school, "includes explicit statements regarding the cultural

values that are fostered in the community and integrates those values in all aspects of the school program and operation” ([Assembly of Alaska Native Educators \[AANE\], 1998](#), p. 17). As an academic and research center at UAF, we acknowledge CXCS as a school. Hence, CXCS’ Core Values include shared international Indigenous values of Respect, Relevance, Reciprocity, and Responsibility ([Kirkness and Barnhardt, 2001](#)).

Respect

CXCS recognizes Indigenous Peoples are inherently sovereign. Each student, each community, and each research project have its own cultural protocols and knowledge system unique to their respective areas. CXCS represents a personal, welcoming, and belonging environment, in which students, communities, and research bring cultural knowledge, traditions, and Indigenous values that are respected.

Relevance

[Kirkness and Barnhardt \(2001\)](#) state, “If universities are to respect the cultural integrity of First Nations students and communities, they must adopt a posture that goes beyond the usual generation and conveyance of literate knowledge, to include the institutional legitimization of Indigenous knowledge and skills.” One of CXCS’ foundational courses is Indigenous Knowledge Systems, created by the late Dr. Angayuqaq Oscar Kawagley. The course description states this course is, “a comparative survey and analysis of the epistemological properties, worldviews and modes of transmission associated with various Indigenous knowledge systems.” Each student and community have a unique worldview which should not only be accommodating but also structural throughout one’s research and education.

Reciprocity

[Kirkness and Barnhardt \(2001\)](#) share, “the emphasis is on making teaching and learning two-way processes, in which the give-and-take between faculty and students opens up new levels of understanding for everyone ... Faculty members and students in such a reciprocal relationship are in a position to create a new kind of education, to formulate new paradigms or explanatory frameworks that help us establish a greater equilibrium and congruence.” In the Alaska Cultural Standards, institutions are encouraged to nurture students’ experiences in schooling and to apply what they have gained in the real-world context.

Responsibility

[Kirkness and Barnhardt \(2001\)](#) state, “Gaining access to the university means more than gaining an education—it also means gaining access to power, authority, and an opportunity to exercise control over the affairs of everyday life, affairs that are usually taken for granted by most non-Native people.” Students who are enrolled in the Indigenous Studies programs are encouraged by their Elders to continue schooling to benefit their respective communities. Many students have expressed their motivation to earn a post-baccalaureate degree to benefit their respective communities.

Shared Alaska Native values

Alaska Native peoples have recognized shared cultural values. Though CXCS acknowledges and respects the international Indigenous cultural values of Respect, Relevance, Reciprocity, and Responsibility; we include these shared Alaska Native cultural and core values as an Indigenous program housed in an Alaska academic institution:

Show Respect to Others—Each Person Has a Special Gift

Share What You Have—Giving Makes You Richer

Know Who You Are—You Are a Reflection on Your Family

Accept What Life Brings—You Cannot Control Many Things

Have Patience—Some Things Cannot Be Rushed

Live Carefully—What You Do Will Come Back to You

Take Care of Others—You Cannot Live without Them

Honor Your Elders—They Show You the Way in Life

Pray for Guidance—Many Things Are Not Known

See Connections—All Things Are Related

ANKN (n.d.).

Each Alaska Native group has their own unique set of cultural values identified by Elders in the communities, and in some groups the cultural values may differ from village to village. However, all cultural values have been passed down from generation to generation for thousands of years. Some groups have created posters identifying their cultural values. Elders, community members, and other cultural bearers worked together to identify and create their own cultural values; they did not come from one individual. To include each one would be extensive. Hence, the shared cultural values listed above continue to ground our students, staff, faculty, and communities as we work together.

Overall work ethics

CXCS faculty, staff, and students work closely with communities and their partners. The First Alaskans Institute (FAI) is one of the many organizations whose focus includes Indigenous-led initiatives which CXCS emulates in research and instruction. FAI formalized a set of agreements (<https://firstalaskans.org/wp-content/uploads/2016/10/FAI-AGREEMENTS-POSTER.pdf>) which CXCS have adopted for all our meetings:

In Every Chair, a Leader

Speak to be Understood; Listen to Understand

Be Present; Be Engaged

Value Our Time Together

Safe Space for Meaningful Conversation

Challenges → Solutions

Takest Thou Hats Off

Our Value of Humor Helps Us

We are Responsible for Our Experience

Take Care of Yourself; Take Care of Each Other

Research is conducted in alignment with Indigenous guidelines and protocols including the “Guidelines for Respecting Cultural Knowledge,” “Coolangatta Statement on Indigenous Rights in Education,” and the “United Nations Declaration on the Rights of Indigenous Peoples” (ANKN, 2000; UN, 2007; WIPCE, 1993). In the “Guidelines for Respecting Cultural Knowledge,” there is a list of actions for cultural responsiveness for researchers. They include, “(a) Effectively identify and utilize the expertise in participating communities to enhance the quality of data gathering as well as the data itself and use caution in applying external frames of reference in its analysis and interpretation (p. 15).” Many students and faculty are actively involved with cultural activities. “(b) Ensure controlled access for sensitive cultural information that has not been explicitly authorized for general distribution, as determined by members of the local community (p. 15).” Students and faculty approach tribal councils to involve them with research at the very beginning. “(c) Submit research plans as well as results for review by a locally-knowledgeable group and abide by its recommendations to the maximum extent possible (p. 15).” Students and faculty share drafts and results to review before any publishing. “(d) Provide full disclosure of funding sources, sponsors, institutional affiliations and reviewers (p. 15).” Communities are well-informed of all sponsorships. “(e) Include explicit recognition of all research contributors in the final report (p. 16).” Participants are recognized for their contributions in dissertations and other publications, and in some cases, they are co-authors. “(f) Abide by the research principles and guidelines established by the Alaska Federation of Natives and other state, national and international organizations representing Indigenous peoples (p. 16).” These principles and guidelines also include the “Coolangatta Statement on Indigenous Rights in Education” and the “United Nations Declaration on the Rights of Indigenous Peoples.” Research by students and faculty are written and developed by Indigenous people, provide guidelines for conducting research ethically and respectfully; and to do so *with, by, and for* Indigenous people.

How do these philosophies support an Indigenous/Native model of well-being?

The CXCS Well-Being Model applies to students, faculty, and communities. While the faculty are involved with various research, some of the themes might overlap with each other. Additionally, students have a choice of at least one area of concentration, but they all have an option to include other areas of concentration.

The Center for Cross-Cultural Studies is a research center which offers master’s and doctorate academic degrees. Faculty are involved with research with communities. Students conduct research for their graduate degrees. As a research center, we encourage community members actively involved with Indigenous research. For all three (students, faculty, and communities), well-being is essential to begin with individuals and communities. Each individual and community define well-being themselves utilizing their own cultural values and epistemology. For ways of being, they are guided by their cultural values which remain constant throughout time immemorial. For ways of thinking, they are encouraged to utilize their epistemology and Indigenous worldviews. Ways of understanding their cultural values and epistemologies are deeply embedded in their ancestral and living heritage(s).

CXCS is an internationally Indigenous Studies program. There is no one Indigenous philosophy which our program draws for its foundation. We recognize students, faculty, and communities bring with them their own rich culture and knowledge systems. From these various philosophies, CXCS continues to grow and provide an Indigenous platform in a Western institution.

Indigenous leadership

All leadership, including Indigenous leadership, takes place in context. [Dei \(2011\)](#) helpfully suggests that “[f]undamentally, the Indigenous should be perceived as mostly about place-based knowing, and understanding of traditional sacred relationships between peoples, their cultures and their cosmologies. These relationships offer a holistic knowledge base” (p. 23). [Blakesley \(2010\)](#) adds, drawing on [Waters \(2005\)](#), that indigeneity is multifaceted, an attribute, always referenced against a specific place, but also an element in personal self-identification. Indigeneity is “a complex and nuanced construct, carrying with it attributes specific to place or geographic location, legal status, and identity” ([Blakesley, 2010](#)). In offering this chapter, we acknowledge complexities of space, time and belonging as aspects of context in the Indigenous leadership that Solomon Islanders recognize and practice. We utilize a lens that celebrates how people relate through leadership socially, culturally, cosmologically, geographically and temporally. Our intent when undertaking this enterprise is to celebrate and honor what Solomon Islanders know and practice daily, informed as they are by kastom (customary wisdom and practice) from the past, and visions for sustainable futures.

Much has been written about Indigenous leadership ([Long, 2017](#); [Khalifa et al., 2019](#); [Edwards, 2015](#); [Henry and Wolfram, 2018](#); [Von Der Porten, 2012](#); [McCalman et al., 2012](#) and others). Writers have stressed strengths-based approaches that honor Indigenous wisdom as complete and sufficient in itself; the significance of the knowledge on which leadership is based; communal approaches to group well-being; spirituality, often revealed in altruistic and service-framed leadership; collectivist communication practices; the social self; the ontological and epistemological foundations of leadership; and the need to embrace a timescale of millennia. These and other relational aspects of leadership resonate with our approach which is to take the “direction of naming” ([Sanga and Reynolds, 2017](#), p. 199) of leadership from the moments we present, paying attention to how leadership is understood in space and time, and thereby adding to the wisdom of leadership literature through specificity rather than generalization. We acknowledge that the methodology of using five moments upon which to base discussion may produce an incomplete view of Indigenous Solomon Islands leadership. However, the diversity of our examples affords significance to our claim that consistency in leadership illustrates contiguousness across space and time.

Solomon Islands

Geographically, Solomon Islands is an archipelago of over 900 islands situated east of Papua New Guinea (PNG) and west of Vanuatu. Culturally, Solomon Islands is diverse—around 80 Indigenous languages are spoken, and multiple Indigenous cultural groups live within the modern nation state ([Dinnen, 2002](#)). A Melanesian creole ([Jourdan and Angeli, 2014](#)), Pijin, provides a lingua franca for most Solomon Islanders. In conjunction with Tok Pisin (PNG) and Bislama (Vanuatu), mutual communication is also possible across other Melanesian populations.

Settled since the time of the Lapita peoples ([Irwin, 2005](#); [Kirch, 1997](#)), Solomon Islands has had a complex recent political history. In 1978, its status as a British Protectorate switched to that of an independent state and member of the British Commonwealth. Relationships that feature donor aid continue with several bodies including the governments of Australia, Aotearoa New Zealand, The United States, and, latterly, China ([Kabutaulaka, 2010](#)). The capital of Solomon Islands is Honiara on the island of Guadalcanal. Auki, the provincial capital of Mala'ita Province is another small township. Much of the country is rural and many people follow a subsistence lifestyle, often aquatically based ([Basel et al., 2020](#)).

Solomon Islanders generally recognize three domains of influence (Sanga and Reynolds, 2019). Kastom is the domain that encompasses customary understandings and practices; the church domain centers on various Christian denominations; the domain of formal institutional life includes government, education, and other statutory bodies. These domains compete for influence over individuals and groups, but their power is generally ordered as given. In accounting for matters such as leadership, one must consider in what domain leadership is being practiced, through what domain the legitimacy of a leader is established, and how leadership in one domain negotiates with leadership from others (Sanga et al., 2018, 2020; Sanga and Walker, 2012). In this account of Indigenous leadership, although much attention is paid to the kastom domain, we also show the strength of kastom-originated leadership as it influences other domains, particularly through the example of education.

Our approach of presenting five diverse moments entails a need to examine what Indigeneity might mean in the Solomon Islands context. The linguistic diversity of Solomon Islands reflects multiplicity so that “Indigenous” can be understood at village, clan and/or tribal levels. However, there is much population movement in the nation state of Solomon Islands and beyond which requires a nuanced appreciation of Indigeneity in Indigenous Solomon Islands leadership. Gegeo (2001) separates space and place in ways that are helpful here. Place is the site, location and root of Indigeneity. It is the genesis of the various Indigenous ideas of leadership understood by a specific group. Space, however, extends beyond the physical into the social, spiritual and moral. It expands so that Indigeneity travels with the voyager to new places, a relevant factor when, for instance, teachers are relocated by government around the archipelago. Thus, when presenting the moments, we embrace the contextual fluidity that affords significance to place-specific Indigenous leadership but also acknowledges space-relevant expressions of Indigenous leadership. This duality makes relevant the notion of Indigenous Solomon Islands leadership in ways that extend beyond the individual’s physical location in village and genealogical location in their clan.

Five moments

In order to investigate Indigenous Solomon Islands leadership, we have selected four moments as examples. These are moments in the sense of their transience in time, especially within a millennial timeframe. They are also “of moment,” significant in their effect on our storied account of leadership. The four range in temporal terms from a historical past through a contested present and into a speculative future. They also extend from being situated solely in the kastom domain to negotiation between kastom and other domains. Through their diversity, the moments offer opportunities to trace links that attest to the strength of Indigenous Solomon Islands leadership and its consistency as a journey to the common good. A fifth moment of reflection is also added.

The labu: leadership as worship

This moment is informed by Kabini as the principal guardian of the Ngongosila labu of the Gula’alā. The storied account draws from “The Mala’ita Labu: Rescripting the politics of living well together” (Sanga, *in press*) to be published by the Pacific Theological College in Re-Storying the Pacific Household Volume 1, edited by Upolu Va’ai and Aisake Casimira.

A labu is a fort-like village of refuge. Labu were common throughout central, east, west, and north Mala’ita, Solomon Islands, in tribal settings during the pre-Christian era. The Mala’ita labu was a sanctuary, a safe space for all where everyone was given their place, including an opportunity to start afresh in life. The labu was of great value to those being hunted. People who were cursed or accused would be listened to by the labu guardians. Those fleeing temporarily from abuse or other forms of harm would find care and welcome. Leadership ensured that, for visitors and refugees alike, the labu was a nurturing and healing space.

The labu guardians vowed to ensure sanctity by remaining loyal to the mission of the labu and by protecting its purpose and purity. Asylum seekers promised to surrender their authority as independent agents to the labu leaders in exchange for guarantees of safety, protection, justice and custodianship. In a pre-Christian multi-tribal, multi-lingual, multi-cultural environment, the labu was a spiritually charged oasis of rest, a place of hope, of new beginnings, new creations and of co-creations of new futures.

The structure of the labu involved a physical compound protected by hedges, walls, and strong fences. It was secured by sentries. This was a sacred space, closely protected in theocratic Mala’ita through the leadership of tribal priests via a stringent moral code and punishment system. For those inside, the labu was a place of promise. Against those outside who wished to cause harm, the labu had human and spirit guardians, feared by foes and hated by labu enemies.

Leadership in the Mala’ita labu is best understood as worship. The labu was a place of worship where residents’ relationships to and worship of their deities were central pillars of a theocratic community. In Indigenous Mala’ita, *rō lā* (obedience) was a primary societal value. According to Sanga (2014b) for the Gula’alā people, “*rō lā* or obedience is an act of worship, and a means of submission to and demonstration of loyalty to the other, particularly to authority” (p. 156). This understanding of worship as relational remains in today’s Christian Mala’ita.

Conceptualized as worship, labu leadership was manifested in the tribal priests’ regular offerings of sacrifices, both on their own behalf and for their people. Worship showed in the ceremonies which priests would perform, in the offerings made to ancestor spirits, in the purification rites they would administer, in the scheduled and contextually called sacred feasts, and in the gift-giving in which people would participate. To be effective in such leadership, strict statutes and codes governed labu communal and private living.

Through their abua or spiritual rootedness and abu lā (holy living), labu leaders exerted influence, exercised stewardship, and played their roles as hosts of their tribal communities. Coupled with an effective support system and cohesive communitarian

capacities, labu leadership provided safety and space for members to individually and communally worship, thereby allowing purposive growth and flourishing for labu members and the community as a whole.

One labu was the offshore island of Ngongosila in east Mala'ita, in operation until the early 1950s. In early 1900s, Christian missionaries from the South Sea Evangelical Mission leased a portion of Ngongosila as their base for Christianization along the northern, eastern, and southern regions of Mala'ita. The northern part of Ngongosila remained a stronghold for the principal tribal group, the Gwailao, whose labu was the island and its surrounding waterways.

The sanctity, mission, and effect of a labu relies on Indigenous Solomon Islands leadership. Ngongosila embodied a well-cared for labu for an extended period of time, stretching back into the period where kastom was the only lore, and continuing until quite recently. Sadly, the community has not remained the example it had been. Historical, national, and local politics created rifts so that community cohesion waned, and consensus was eroded. Leadership acts that were once applauded became derided. Like other Solomon Islands communities today, Ngongosila is experiencing acute vulnerability and needs revisiting and reimagination. More than restoration, a vision of a new created community is needed.

However, like the stones of Ngongosila, Indigenous Solomon Island leadership endures to offer a pathway forward to a sustainable future and a renewed labu vision. The Gula'alā people mourn the dug-up coral reefs and loss of marine life around the island; weep over the loss of effective tribal authority; regret the dismantled community cohesion; and deplore the inward-looking confrontational leadership and resultant contentious splintering of relationships in the village. However, there is hope centered on Indigenous Gula'alā ethical teachings, leadership such as is contained in the joyfully welcomed book, *Fānanau lā 'I Gula'alā* (Sanga, 2014a). Hope in this instance is borne out of contextual public grief and cultural ontological loss.

The mission of the labu is being revived and augmented. Through the book, elders can now teach their young ones again using Gula'alā language and their own Indigenous knowledge. In tandem, assurance comes in the form of generous Gula'alā landholding clan leaders who have gifted free lands on the eastern coast of the main island of Mala'ita to displaced and diasporic Gula'alā, those who have lost homes due to the damage of sea-level rise on Ngongosila atoll. As a result, new Gula'alā-speaking communities have been built and settled, new farms and lands cultivated on mainland Mala'ita.

Spiritual leadership is also being rejuvenated. Through prophetic teachings by Gula'alā pastors and church leaders, the Gula'alā are assured of God's sovereignty and care; spurring the people on to give of themselves as Gula'alā as they had done through the labu. The Gula'alā Volunteers Ministry Band (a men's team of builders) was formed and travels to different parts of Mala'ita and the Solomon Islands enacting the spirit of the labu by building without payment churches and community halls for other groups.

In labu understanding, departure is an essential part of alidea or homeward journeying. The Gula'alā have had to learn to develop capacities for adaption, responsiveness and change. Labu leadership has required the Gula'alā to depart in haste or as planned, in sorrow and/or in joy. After all, their historical settlement on Ngongosila atoll was a result of an intentional departure from South Mala'ita in a previous century.

For the Gula'alā, any departing must be joyous. Even if sad or hard (in physical and/or experiential ways), departure is liturgical and imaginative. The theocratic Mala'ita mind believes this. Labu understanding urges Gula'alā leaders to a departure frame of reference because it is counter to self-serving and enslavement ideologies and/or loyalties.

Rara'aba: leadership as knowledge guardianship

This moment is informed by Kabini as alafa or male tribal leader of Gwailao. The storied account draws on Sanga and Reynolds (2020).

A rara'aba is a calming of nerves meeting. The moment we describe took place in a rara'aba of the Gwailao clan conducted in the Gula'alā language. Material was translated by Kabini, member-checked and then cleared for publication by the council of the principal alafa of Gwailao. The subject of the meeting was debate of, and approval for, the tribal secret knowledge contained in *Fānanau lā 'I Gula'alā* (Sanga, 2014a) to be publicly gifted for education purposes.

Knowledge guardianship of private material is a key area of leadership in Solomon Islands. In Mala'ita, Solomon Islands, there are three kinds of knowledge: public, specialized and sacred. Secret knowledge can be located in the second and third of these categories, although in an integrated Mala'ita worldview, both knowing and not knowing affect the whole of life (Sanga and Reynolds, 2020). As an example, Gegeo and Watson-Gegeo (2001) observe that for the Kwara'ae of Mala'ita, knowledge associated with certain rituals, sorcery and healing persists in secret domains, notwithstanding the influence of Christianity. Similarly, Sanga (2014b) describes moral education in Gula'alā, Mala'ita, as existing in a private knowledge domain guarded by sub-groups in clans. Because guardianship assumes responsibility for sharing or withholding what is known, leadership, privacy and knowledge are inextricably linked in these Indigenous Solomon Islands contexts.

Examining authority to maintain and/or negotiate the placement of knowledge in certain domains offers an appreciation of the dynamics of Indigenous Solomon Islands leadership. Guardianship over knowledge involves position, but this is not solely an individual matter. In communitarian Mala'ita, a person's identity can be both individual ("I") and communal ("We"). When an individual plays the role of a knowledge guardian they lead as an individual and as a family or clan representative. Two principles exercised in the rara'aba show how authority in Indigenous knowledge guardianship is underpinned.

First, the principle of 'ado lā ana rau lea fainia tōa or stewardship articulates the value of sharing something good with other people. Knowledge is assumed to be a good thing, worth sharing now and into the future. Knowledge must have guardians to ensure that the knowledge is well cared for. Second, the 'ado lā or stewardship principle is operationalized through the notion of nao-nao lā or seniority. Thus, the question of leadership authority in the matter the publication of *Fānanau lā 'I Gula'alā* (Sanga, 2014a)

involves appreciating guardianship in relation to the knowledge, and nuanced sensitivity regarding position in relation to others. Developing these understandings in context was a purpose of the *rara'aba*.

In the context of the *rara'aba*, seven dimensions of seniority are given in Sanga and Reynolds (2020). Seniority can involve matters such as *garangi*, guardianship vested by virtue of a direct line to the first custodian of the knowledge; gender and age such as through *futa lā* and *wane me geni*; generational closeness to the principal knowledge guardian expressed as *fuli wane*; blood relations as in *futa lā ana tē 'abu*; wider relationships including blood, marriage and adoption as in *wane futa-wane kwaitā*; and *wane goumouri* which involves agency, credibility and esteem. Social change, such as population movement away from the village and the availability of publication technologies, is a source of dynamism that, when framed through principled thought, can result in changes in the way knowledge is positioned. Dimensions of seniority may appear fixed, but actually require fluid negotiation when faced with innovative circumstances such as book production.

Two examples of how the *rara'aba* interrogated secrecy are offered. These were addressed in a context where secrecy itself was not debated, but the qualities and extent of the secrecy were at stake. First, a consideration of time offered opportunities to sift the relationship between the origin of the knowledge and its secret status. A well-known person, *kōkō Ruth*, was identified as the origin of the knowledge to be published. However, genealogical questions were asked to probe where and when she obtained the knowledge. This shifted attention to the knowledge itself which pre-existed the identified individual and, consequently, drew attention to clan structures as means of transmission. The discussion of secrecy was thus extended to prior generations and the communal parameters of secrecy were widened. The *rara'aba* served to erode any unequivocal claims regarding the level and type of secrecy relevant in this case. In effect, definitive claims of secrecy were revealed to rest on less secure historical footing than might have been assumed.

Second, a consideration of the movement of knowledge through space enhanced participants' perspectives regarding the secrecy. One speaker pointed out the way that women bring knowledge with them when they enter a clan by marriage. As a result, the origin and distribution patterns of secret knowledge are unclear. When knowledge comes through this route, is it held in expressions of wisdom or the teaching that the wisdom embodies? Embodied wisdom is visible and therefore the boundaries of secrecy are more inclusive than exclusive and further transfer is possible by learning through action. If knowledge is understood in this way, the sense of secrecy may not be intense, and guardianship deserves reconsideration. In addition, some people who should be "inside" the borders of secrecy may behave in ways that suggest they have not acquired the wisdom embedded in the knowledge and are therefore "outside." This kind of interrogation of knowledge transfer through space questions the relevance of certain principles of seniority because people's relationships to knowledge deemed secret is not always predictable.

The application of principles of knowledge guardianship in the *rara'aba* reveals much about Indigenous Solomon Islands leadership.

- First, leadership involves the application of known and agreed principles, but in ways that sift a complex situation to arrive at a conclusion. Principled leadership, therefore, is not absolute but contextual. The intersection of many contributions to the *rara'aba* from clan members resulted in a decision by and on behalf of the clan. The decision was arrived at by peeling back layers of the context to reveal the quality, intensity and significance of secrecy.
- Second, leadership responds to wider context. In this case, an aspect of context is the movement away from the village of clan members who occupy certain genealogical and guardianship positions. In this circumstance, knowledge transfer cannot be guaranteed. Gifting of secret knowledge for publication is a way to support transfer that has implications for secrecy. Thus, leadership must deal with the relative value to the clan of transfer when compared to secrecy. Balance must be achieved in ways that honor all those who generated, hold, and will benefit in the future from the wisdom contained in knowledge. Thus, leadership is never static.
- Third, leadership honors unity. The process of the *rara'aba* allows what might seem to be conflicting and divisive principles to promote group unity. The discursive structure promotes language that wraps principles in dignity and steers discussion in indirect ways to prioritize harmony over a swift resolution. This takes place in a context where food is shared and socializing is central so that the coming together, form of the *rara'aba*, and discussion itself all support the enhancement of warmth between clan members as the most significant outcome.
- Fourth, leadership values action. Through the *rara'aba* the guardianship of knowledge came to rest with those who practice the wisdom it contains. Since secret knowledge as discussed here is centered on sustainability, the form and purpose of the *rara'aba* are united as expressions of the wisdom of unity. As a result, the *kastom* tenet of generosity actioned through gifting became the focus of the solution rather than breaking *kastom* for gain or overstepping *kastom*-derived protocol boundaries and principles.

Underpinning these four aspects of Indigenous Solomon Islands leadership is its relational core, in this case exercised dialogically. The *rara'aba* frames leadership primarily in ontological rather than political ways in a context. Clan members are both "I" and "We," and leadership decisions are made by, on behalf of, and for the benefit of the collective. Leadership takes place by acknowledging complexity as an aspect of context and prioritizing "We" as the touchstone of Indigenous Solomon Islands life.

School and *kastom* leadership: negotiation across domains

This moment is informed by research conducted through the auspices of Victoria University of Wellington and the Institute of Education, University of the South Pacific, funded by the Development Leadership Project and supported by the Australian Department of Foreign Affairs and Trade. The data were collected by research partners Grace Rohoana and Graham Hiele of Solomon Islands National University from school and community members in various Solomon Islands locations using a *tok stori* approach

(Sanga and Reynolds, 2019, 2021; Sanga et al., 2018). Tok stori is a Melanesian kastom relational orality used for many purposes including conversation, pedagogy (Sanga et al., 2021), evaluation (Paulsen and Spratt, 2020) and research (de la Torre Parra, 2021). To illustrate Indigenous Solomon Islands leadership negotiations with the institutional domain, we select data from tok stori sessions involving two school leaders, one female (F) and one male (M).

Through tok stori, F offered two metaphors for leadership, one potentially ancient and therefore kastom based and inherited, and the other comparatively recent and perhaps church derived. "Leadership is explained in the canoe concept—its paddlers are expected to paddle in both sides of the canoe so that the canoe will go on the straight direction. If the paddlers only paddle on one side of the canoe, the canoe will not go straight and may sink in the storm. Another metaphor ... is light. Light needs power. Supposing that there is no power, the light will not be able to shine on everyone so that they can see the leader. Like so, a leader has to shine on everyone, but this can only be possible through possessing important qualities. A leader must be transparent so that people know what they are doing rather than hiding in the darkness." These metaphors draw attention to the collective responsibilities of leaders and the shared outcomes of leadership. Through them, F suggests "transparency, trust and respect" are important aspects of Indigenous Solomon Islands leadership.

F's explanation of the two metaphors draws attention to the visionary and relational nature of leadership. In the kastom context of the canoe, navigation is important; the fate of paddlers is interlinked by the shared vessel. Trust is key when contributing to collective movement and the fate of the vessel through paddling. F applies this kastom thinking in school: "In the school, the head teacher and the school principal are leaders. The school board chair and school board look after the school. The roles of these leaders are to direct and lead people in order to carry out what is needed to build the community. From my experiences, if trust is not developed, even teachers will start to murmur—and they will choose not to come to school anytime they choose to."

Similarly, the metaphor of light shows the way institutional leadership is informed by church example. Describing her school context, F says "I learned from the catechist and my uncle the importance of being transparent. I admire some of the leadership attitudes and practices they demonstrated in the church circle ... The catechist is so transparent in their work, so I try to do likewise in my own work. Yes, if I do not practice transparency, I may not develop the trust from my teachers and parents."

While negotiation between domains leads to positive outcomes when key leadership elements travel into school leadership, the divisive consequence of self-interest can also be disruptive in multiple domains. F narrates an example. "In the community, I learned that leaders do not always trust each other ... One thing that pulled leadership back is logging ... Before logging arrived in the community, the people at home used a metaphor and said: "Do not open the parcel" and "Leave it closed" because if the parcel is opened, we will be separated—and that happened." She has seen similar divisions in school life. "One thing I learned is that [some in] the community see the school as their private school. According to the history of the school, a woman started the school and today her grandchildren are the ones that expect the school to give them money every time the grant money is received. So, they come and swear at us teachers and asked for school grant money. They regard this school as their private business."

The focus of F's school leadership is not her managerial function, although this is present. The heart of her practice is relational, underpinned by values that originate in kastom. The application of the canoe and light metaphors by F as a school leader suggest the relevance in institutional life of kastom ideas and divisive consequences regardless of domain when key aspects of kastom leadership are absent.

M inherited a leadership metaphor. "I always remember a teaching from my parents in a form of a metaphor—a house. When you build a house, the foundation of the house must be built properly till you reach the roof so that when the house is completed it is firm and strong. My parents always reminded us of this metaphor. Since then, I became aware of my father's ideas as a leader in the family. It has helped me a lot because I often reflect back on my father's leadership approaches and methods when dealing with difficult issues that arise."

M unpacks the metaphor through dispute resolution. "When there is an issue involving two persons in the community, it is not proper for me to make other members in the community become aware of their conflict. Such matters I must keep confidential. To settle such disagreements, and to be fair for both conflicting parties, I have a private discussion with each one to seek their views. I found that this approach is effective in settling disagreements among community members." This process promotes alignment between individuals to support a strengthened sense of the collective.

However, in diverse Solomon Islands, kastom leadership is not always identical. M recognizes the complex origins of parents and staff, and the varied ideas from Indigenous Solomon Islands leadership they carry. "In schools we know that we work with students, teachers and parents of different ethnic groups ... Because these people are from different backgrounds, it is impossible to just show up and say, "Let us do things this way" and expect them to adhere to my plans." M's inspiration when molding community from diversity is his parents' example. As with dispute resolution, this involves small scale relational activity within general transparency. To gain community traction in a classroom building project, "I collected the views from members of the community whom I could easily approach and then began designing the best options. I began to engage in networking. While some members at first ignored my request to help ..., the progress of the work done slowly got them to get on board. Today I am pleased with community members' level of support for the school."

M provides specific aspects of kastom practice. "I learned from the community ... to prepare a meal for anyone which I have invited to meet and discuss with me. I applied this approach as well in school ... Sometimes some parents complained that they are tired of doing work for the school. Because the reality is many parents have limited or no formal education at all and they do not earn money from engaging in schoolwork ... So, providing meals for parents that participate is a gesture of appreciating their commitment. In this way they are willing to participate in other school projects or work." When the gifts of time and labor are

paired with the gifts of food and the effort of cooking, the balance achieved through generosity lends support to leadership legitimacy. As a result, community is built through collective activity.

Like F, M has experienced the way leadership in the kastom domain can be eroded when the interests of individuals undermine the good of the collective. "This type of leadership causes some disgruntled members of community to not respect decisions or directives from community leaders. For example ... finances provided by some external sources for the benefit of the whole community are used by the leader, or only shared to some members of the community. Even our cultural practices have changed. For example, gifts and food during weddings are not given to every member of the community as practiced in the past." The institutional domain is not immune from such effects. "Some relatives sent three of their children to live with me and attend classes in ECE. But my relatives never attended schoolwork during Parents' Day. One evening I visited their houses and explained to them that the school does not belong to you and me. This is a school and if you are concerned with your child's education then you need to participate in schoolwork on Parents' Day."

These two school leaders' tok stori sessions reveal much about Indigenous Solomon Islands leadership.

- First, Indigenous Solomon Islands leadership values are influential beyond the kastom domain. In some cases, kastom leaders are also school leaders who carry values from their kastom socialization in their families. However, the values are also present in the relational bedrock on which kastom leadership practice is built. The degree to which the school and community are integrated is a predictor of the success of the school as an institution, at least as far as the provision of buildings is concerned. Kastom values such as transparency, trust, and respect bind people together through mutual appreciation and integrity, regardless of domain.
- Second, kastom leadership transcends domains through metaphor. Building and paddling are kastom activities undertaken as a collective that support survival. Light is a benefit shared by all. Each metaphor speaks in its own way of the significance to leadership of collective existence and the importance of shared fate when judging leaders' success. Taken together, the metaphors offered in this leadership moment relegate individualism to the status of an unproductive path at best, and a catastrophe such as drowning or blindness at worst.
- Third, leadership values social cohesion. Cohesion is represented in the values discussed above and is an aspect of all three offered metaphors. However, cohesion requires enactment. F's tok stori shows the deliberateness of a school leader seeking to enact trust and transparency in the school context. M's tok stori shows how kastom protocols such as house to house visits and the provision of food support social cohesion. For F and M, a cohesive relationship between school and community is prized as a way forward and is an aim of their leadership.

Climate change: leadership as hope

The Indigenous Gula'alā of east Mala'ita Solomon Islands, have been battling five decades of sea level rise and the daily erosion of their atoll home. Since the 1960s, the Islanders have fought against the destructive effects of higher water levels, cyclones and ongoing current erosion. A 1991 report, SOPAC Technical Report 121 (Rearic, 1991), noted that the coastal retreat for Ngongosila and Kwai atolls was 2–3 m per year, and that the process had been happening since the 1960s. The atolls are 300–500 m in length and 100 m wide. While the highest point on each atoll is 2 m above the mean sea level, much of the islands are around 1 m above mean sea level. Moreover, both atolls are exposed to 1000 km of open ocean.

These factors have meant that for several decades the Gula'alā have been exposed to environmental challenges on an everyday basis. Moreover, while densely forested and sparsely populated in the 1920s–1930s, the Gula'alā atolls of Ngongosila and Kwai have seen considerable overpopulation for their sizes, thereby adding to the environmental stresses which were and are present. It is little wonder that people have referred to the Gula'alā atolls as the "sinking islands" (van der Ploeg et al., 2020), portraying the Islanders as victims of climate change.

Beyond physical changes for Mala'ita people, the manifestations of community loss from the climate crisis are multiple. Loss is seen in the littered unplanned brown sago-leaved houses and unkempt smoky cooking huts. Loss is shown by the captive parrot flapping its wings all day on a house laundry line. Loss is present when feared ancestor skulls and aged bones are eaten by the Ocean deep. Loss is experienced in once gendered repositories and sites of knowledge being eroded, their purity watered away, thereby rendering them ordinary and secular.

As a leadership response, the sili (Indigenous Mala'ita lament) which follows, captures the grief of the Gula'alā as they respond to the changes of their environment. In it, the Gula'alā express grief over a diminished life and abandonment:

'Oi, ote wela 'ae (O you of youthful understanding).

Molu fā angī nau laona asoā 'I tara'ena (You have caused my heartache today).

Ku manata 'agu to'ona (Inciting memories of bygone days).

Na fataia na kō nau kini, na abua babatō gera kini, na bae abu gera kini, ma na ramoa gera kini laona tolo ma na asi. (The exploits of my ancestors, the sacred utensils which rooted my worlds, the sacred shrines of power and the life-giving spirit of my very existence).

Kō nau kini wane gera rangonia toa, gera adafafia toa, gera ogua toa, gera ka aofia fana toa (The generosity of my ancestors, their stewardship over an integrated world, their cohesive leadership as guardians and hosts).

Kō nau kini gera rigita ana 'aba gera (The autonomy, strength of hand and authority of my ancestors).

Molu ngalia nō fāsi nau. Molu fā inomae nau 'I tara'ena. Molu ada siofa agu (You have robbed me of life today. You have made me an orphan, a destitute in my own world).

'Oi, keleirurūfia lea nau 'ae (It is in grief that I lament uncontrollably now).

In Gula'alā leadership, grief is publicly voiced. Doing so produces hope as it is only in the context of loss and grief that hope is credible and authentic. Comfort arises out of the grief over Ngongosila's ontological and theological loss. Subsequently, hope comes to the people in the form of the occurrence of something new. In this instance, the newness comes in the form of the Indigenous Gula'alā teachings on ethics as contained in the book, *Fānanau lā 'I Gula'alā* (Sanga, 2014a). In introducing the compilation of the Indigenous Gula'alā ethics teachings, Sanga (2014a) explains, "These teachings are gifted to and to be generously shared with all Gula'alā children (p. 15)." He further urges: "Fathers and mothers are to sit with their children and teach them diligently and daily about these precepts" (p. 15).

Reflection: leadership as consistent and contiguous

As we reach the end of our chapter, we pause in a fifth moment, a moment of reflection. We reflect on in the way that consistency in Indigenous Solomon Islands leadership provides contiguousness across space and time. Across moments one to four, Indigenous Solomon Islands leadership can be observed seeking social cohesion in the form of unity. From the ancient labu to the modern school, the one-ness of Solomon Islands societies is an aim of leadership fostered by a communal approach. That approach is relational, a second contiguous element.

Relational leadership connects the leader to the group, and the effectiveness of leadership to group-based outcomes. Indigenous Solomon Islands leadership is concerned with how the actions of the leader benefit everyone. In the rara'aba, concern was shown through leadership for those who had originated secret knowledge, those holding it currently, and those yet to come. The lament references the past, present and the future. These temporal conceptions that extend beyond the here and now intensify the responsibility of present relationships because honor is significant, and time is not linear. A society in which honor is degraded is not well led and a society that denigrates its past can have no future.

Indigenous Solomon Islands relational leadership extends beyond the human. Leadership as worship in the labu shows how the geographical and cosmological are inextricably linked. Similarly, the metaphors supplied by educational leaders show how leadership delivers wisdom from the kastom domain to the institutional. In these cases, leadership is transcendent, a principled matter in a holistic world where the division of time and space or spirit and matter can lead to unethical behavior, but where relationality is the key to sense making.

The core of the common good to which Indigenous Solomon Islands leadership is oriented is sustainability. This is linked to cohesion, well-configured relationality, and holism. However, sustainability is not a synonym for a static approach to leadership. This is because the world is changing as it always has. To serve the common good, Indigenous Solomon Islands leadership is dynamic. It deals with leadership at the intersection of domains, the advent of new technologies and social settings, and increasingly with climate change.

The dialogic nature of Indigenous Solomon Islands leadership is consistent across moments. Principled leadership must enter into dialog with circumstance and those affected. Hope extends from worship, honoring the stones of Ngongosila labu in response to change. It provides a route to a future where the strengths of Solomon Islands communities adapt while being ontologically grounded. Dialog embodied in the rara'aba is leadership in action. The wisdom of the past structures practice in the present to enable hope for the future. Leadership aspects such as transparency, trust and respect cement together kastom and institutional domains as aspects of a single whole. In these ways, Indigenous Solomon Islands leadership ensures the temporal remains

integrated with, not separated from, the social, cultural, cosmological, and geographic in a connected reality. Thus, Indigenous Solomon Islands leadership provides forward looking vision in contiguous dialog with the past.

Closure

This chapter has made a case for Solomon Islands Indigenous leadership as springing from, and embedded in, Solomon Islands societies. It is leadership that seeks sustainability as the common good in socially, culturally, cosmologically, geographically, and temporally appropriate ways. Our storied exploration described Indigenous Solomon Islands leadership through five moments: the labu or sacred island space; the rara'aba or calming of nerves meeting; school leaders' negotiations of the intersections between kastom (customary) leadership and school leadership; lament as hopeful attention to climate change; and a moment of reflection. Together, the five moments represent diverse but contiguous aspects of life in Solomon Islands. Their assemblage encourages appreciation of the strength of Indigenous Solomon Islands leadership to respond constructively to changing circumstances on a journey that is framed around community cohesion in pursuit of a sustainable future.

Introduction

Between 2014 through to 2019, I had a series of seemingly unrelated experiences in the professional, personal and academic parts of my life. I made certain observations, and drew unexpected connections and overlaps across the (seemingly) disparate parts. I have attempted to carry out an initial, exploratory analysis of these experiences and observations in order to render them as educative and sources of learning and insight. The global pandemic that began in 2019 paused the process. The opportunity to write this chapter gently reactivated and accelerated this exploratory study.

In 2014, my attention was drawn beyond Aotearoa New Zealand (where I live and work); beyond the island nations and countries of the Pacific Region (which includes Samoa, my birthplace) to several education initiatives led by Pacific-heritage peoples, for Pacific-heritage learners within pockets of Pacific-heritage communities in Australia, the United States and New Zealand. I noticed that each of these education initiatives fore-grounded the valued knowledges and languages of specific Pacific-heritage home islands. I noticed that these initiatives were led by professional, urban-based Pacific-heritage Gen Xers (and a sprinkling of millennials) espousing strong commitment to transformation and change for their communities. Most of all, I noted that none of these initiatives were instigated by the state or local authorities. Rather they were grass roots in origin and subsequent development.

I began to tentatively theorize the possibility of a new conversation, one that could weave such initiatives together, focusing on the education, development and engagement of Pacific-heritage peoples, and leadership within the Pacific diaspora. Conversations about education and leadership within Pacific-heritage communities within metropolitan cities in Australia, the United States and New Zealand are not new—however, connecting such conversations together, and theorizing them across and within an existing network of relations IS (arguably) new. One of the earliest conceptualizations of this Pacific transnational space is Oceania, developed by Pacific elder-scholars Albert Wendt and Epeli Hau'ofa (Wendt, 1976; Hau'ofa, 1993). It conceptually brings together Pacific peoples located in within the Pacific and Pacific peoples with migrant histories in Pacific Rim nations such as Australia, New Zealand and the United States. There is no binary with Oceania. Samu (2010, p. 4) explained Hau'ofa's (1993, p. 6) conception of "world enlargement", a process carried out by Pacific families, as follows:

*Tanya Wendt Samu is a Senior Lecturer in Education at Waipapa Taumata Rau, the University of Auckland, New Zealand. Tanya's research and scholarship has focused on Pacific/Pasifika education and Pacific research in education, in addition to curriculum development (in social studies, social sciences), for over twenty years.

Pacific people map their worlds in terms of the location of their extended families. These maps frequently include New Zealand, Australia and the west coast of the United States of America, where parents, aunts and uncles, brothers, sisters and cousins reside. Modern technological advances in telecommunications and air travel have helped strengthen these familial networks. Traditional socio-cultural obligations are maintained by the flow of remittances, generally from the Pacific rim homelands of Pacific migrant communities to their Pacific country of origin, via the convenience of electronic transfers. There is also a counter-flow of cultural wealth such as tapa (traditional cloth made from mulberry tree bark), tivaevae (traditional quilts) and ie toga (fine mats) which are an intrinsic part of life events, when family members travel to visit one another for weddings, funerals, and church openings.

In framing this initial exploratory study, I have selected two education initiatives (one in the United States, one in New Zealand) and two leadership initiatives (again, one in the United State and one in New Zealand).

The rest of this chapter is organized into five sections. The first describes the context of the study and my positionality. The second presents the conceptual underpinnings. The third details the inquiry that was undertaken and the four key questions that inform and guide the exploratory study, while the fourth section discusses key insights that emerged.

The overall context and positionality

Positioning myself

I live in Auckland, Aotearoa New Zealand. My father is Samoan, my mother is Maori, Ngati Kahungunu to be precise. From one side, I am a migrant from Samoa. My children, nieces and nephews were born and raised in Aotearoa New Zealand. From the other side, I can trace my whakapapa or genealogy in Aotearoa back two generations before the waka that brought my ancestors to its shores. My connections to Aotearoa are deep. My legal connections to New Zealand are more recent in comparison. I was awarded citizenship when I was 11 years old, and I hold a current New Zealand passport.

Much of my academic career (spanning twenty five years) has focused on the education and development of Pacific-heritage peoples residing within Aotearoa New Zealand. I liken my teaching, research and service in the field that I have referred to as Pasifika education (Samu, 2010) as an all-encompassing personal, professional and intellectual fusion of educative experiences. These experiences have not necessarily been part of a systematic, orderly, sequential, intentional career program. I doubt such career trajectories are possible for many of us who were teachers and social workers before moving into the academy to be teacher educators, social work and counseling educators, academics and scholars.

Locating Pacific/Pasifika/Pacific-heritage populations

Oceania as a conception “sees” no international political boundaries. However,

please note that I will be using Pacific-heritage, Pasifika and Pacific interchangeably to refer to those who identify with one or more cultures indigenous to the island countries of the Pacific and are located within a Pacific Rim nation. I do not include New Zealand and Australia as Pacific countries or nations. Rather, I position them as Pacific Rim nations, along with the United States. This is an admittedly blunt typology, but Pacific Rim nation reflects the relative economic and political position Pacific Rim nations have compared to Pacific island nations. Pacific-heritage populations are minority populations within Pacific Rim nations. For example, a key feature of the Pacific population of New Zealand is its size relative to the total population. In 2018, the Pacific population in New Zealand was 8.1%, with 381,642 peoples. This is projected to increase significantly (Ministry of Pacific Peoples or MPP, 2020, p. 10).

However, the Pacific-heritage populations of the United States and Australia are considerably smaller as a proportion of the national population compared to New Zealand. For example, in the United States, “roughly 690,000 people identified as Native Hawaiian or other Pacific Islander alone but almost 900,000 identified as NHPI in combination with another race” according to the US Census Bureau,¹ drawing on 2020 census data. The total population of the United States was 331.4 million. According to Parliament of Australia,² the total population in the 2021 census was 25.4 million. According to Bately (2017), those claiming “Pacific Islands ancestry (excluding Maori)” were 0.88% of the total population in the 2016 census. Information about the proportion of the Australian population that identified as such for the 2021 census was not available at the time of writing this chapter.

From a state level perspective (for example, Queensland, Australia, or California in the United States) Pacific peoples are proportionally, very small minority in terms of numbers. From the perspective of metropolitan areas or cities, such as Brisbane, Queensland; or Los Angeles, California, Pacific peoples become more visible, but are still small, proportionally. However, it is in terms of suburbs or cities within mega-cities, where we find “pockets of Pacific Islanders” (the term Pacific Islanders appears to be used by institutions in the United States and Australia). It is at this level, where Pacific communities are much more visible and known to local government agencies and services such as schools and housing concentration. Examples include the city of Logan, part of the Brisbane metropolitan area. Logan has been described as “the heartland of Australia’s Pacific Islander population” (Chenoweth,

¹<https://www.census.gov/library/stories/2022/05/aanhpi-population-diverse-geographically-dispersed.html#:~:text=There%20are%2020.6%20million%20people,according%20to%20the%202020%20Census.>

2014). West Valley in Utah, the United States has been described as “the first large Utah city to be ‘minority majority’ where minorities combine to make up a majority of the population” (Davidson, 2018). 2.7% of the almost 137,000 population of West Valley identified as Pacific Islander. Given that the four selected education initiatives for this study are located in New Zealand and the United States, more contextual details will now be presented.

Aotearoa New Zealand

The formal, institutional name for Pacific heritage peoples in Aotearoa New Zealand has changed several times over the last 70 years. From Pacific Islanders, Pacific Polynesians, Pasifika, to simply Pacific (the current term of reference for many government departments), there has been the tendency to group together those who identified culturally with one or more Pacific nations (Samu, 2015). Prior to the mid-1990s, the underlying assumption of such terms was that the group was homogenous (Samu, 2020), and therefore could be responded to as one simplistic, unified block of sameness. Later in the 1990s, such umbrella terms acknowledged the diversity of languages, cultures, worldviews and histories within. Recognition of more nuanced and contemporary expressions of being “Pacific”, related to being urban, and homegrown in Aotearoa New Zealand, also began to emerge at the same time (Samu, 2015).

In a recent report (MPP, 2020), the Ministry of Pacific Peoples identified four key characteristics of Pacific population of New Zealand: it is young (with a median age of 23.4 years); growing (it grew by 29% between Census 2011 and Census 2018); diverse (in terms of cultural or ethnic identity; birthplace; settlement histories and regional distribution within New Zealand) and culturally rich (it includes people who identify with one or more of seventeen cultural groups, the main groups being: Samoan, Cook Island, Tongan, Niuean, Fijian, Tokelau, Tuvalu, I-Kiribati and Rotuman).

There are certain implications for Aotearoa New Zealand, as a consequence of this population profile. Most of the growing Pacific population is concentrated in specific suburbs or electorates. They represent voting power. The combined Pacific and Maori population represent almost a quarter of the total population of the nation. Both populations are youthful, with median ages in early twenties, and higher birthrates. Given the aging profile of the dominant European heritage population, these stats have implications for national level planning and provision in the employment; education; housing and health.

The cultural wealth of Pacific peoples is considered by many government agencies to be integral to developing appropriate, contextualized services for Pacific peoples in health, education, and social development, as evidenced by national level strategic plans with Pacific-specific targeting. Examples include the *Ministry of Education’s Action Plan in Pacific Education 2020–2030* (2020) and the *Ministry of Health’s Ola Manuia: The Pacific Health and Wellbeing Action Plan 2020–2025* (2020). The current position of Pacific peoples within New Zealand (developed over the past five decades) is best captured by the following somewhat aspirational statement within the Ministry of Pacific Peoples’ Pacific Aotearoa Lalanga Fou Report (2018, p. 5):

Our story as Pacific peoples in Aotearoa is one that is both familiar and ever evolving, in response to the changing currents of the modern world. Waves of migration have laid a foundation for our Pacific story; a story that involves aspirations to be a confident, thriving, prosperous and resilient Pacific Aotearoa. Our strong ties with tangata whenua¹ through our whakapapa², and shared moana³ help strengthen our identity in Aotearoa. Today, Pacific communities are recognised for the diversity they bring, the knowledge they impart and the contribution they make to the uniqueness of Aotearoa.

United States

The United States Census Bureau³ uses the term “Other Pacific Islander” with sub-groups including: Polynesian (Samoan, Tongan, Other Polynesian); Micronesian (Chamorro, Marshallese, Other Micronesian) and Melanesian (Fijian, Other Melanesian). It seems that usual categorization is Native Hawaiian and Other Pacific Islander or NHPI. The Bureau gathers data on NHPI and subgroups as well as NHPI “in combination with other race”. In the 2020 census, the NHPI population was 1.586 million with 689,966 identifying as NHPI alone, and 896,497 NHPI in combination.

Historically, Asians and Pacific Islanders have been grouped together by government classifications, and at some levels of government and some institutions, this usual practice. So it is important to bear this in mind when looking for and encountering data relating to the Pacific-heritage population within the United States. In terms of location, just over half of NHPI are located in Hawaii and California. The states with the next highest Native Hawaiian/Pacific Islander populations are Washington, Texas, Florida, and Utah. At the level of individual states, this population is still quite a small minority group. In the 2010 census, for example, there were approximately 37,000 NHPI in the state of Utah. The total population of Utah was 3.2 million. Smaller population sizes nation-wide and state-wide positions Pacific Islander populations to vie and compete for additional funding and resourcing, if needed by specific Pacific communities. One can assume that much more lobbying and community organization and activism is required in such settings and contexts (compared to the Pacific population within New Zealand).

³<https://www.census.gov/library/stories/2022/05/aanhpi-population-diverse-geographically-dispersed.html#:~:text=There%20are%2020.6%20million%20people,according%20to%20the%202020%20Census.>

Conceptual underpinnings

When radical post-colonial writers and artists from the Pacific were challenging cultural canons, and providing counter-hegemonic conceptions in the 1970s (for example, Albert Wendt, 1976) and early 1990s (for example, Epeli Hau'ofa), they focused on Pacific peoples living *within* the Pacific—and not on its *margins*, as in the Pacific Rim (Coxon, 2011). It is here that comparatively large communities of Pacific-heritage peoples have become established in certain suburbs or cities of metropolitan cities such as Auckland, Sydney, Los Angeles, Honolulu. These communities are a consequence of immigration from island nations such as Samoa, American Samoa and Tonga which began in the late 1960s and continued across the 1970s. Vibrant first, second and even third generation Pacific communities have since emerged within these metropolitan societies. This chapter collectively refers to them as the Pacific diaspora, recognizing global processes (such as labor migration) and inherently Oceanic processes (such as Hau'ofa's world enlargement) that have shaped contemporary Pacific peoples socio-economic positioning, relational connections and cultural identities across time and space.

Conceptualizing Oceania and taking an oceanic perspective

In his seminal essay "The New Oceania", published in 1976, Samoan writer and scholar Albert Wendt, described the provocative body of writing and artwork that was emerging within the Pacific Region at the time as ".... a revolt against the hypocritical/exploitative aspects of our traditional/commercial and religious hierarchies, colonialism and neo-colonialism and the degrading values being imposed from outside and by some elements in our own societies" (p. 59). His conceptualization of a "New Oceania" included counter-hegemonic features such as the importance of individual dissent. He warned that "without it our cultures would drown in self-love" (Wendt, 1976, p. 52). He advocated, not for the revival of past cultures but "for the creation of new cultures which are free of that taint of colonialism and based firmly on our own pasts" (p. 53). In exploring ideas such as Wendt's and expanding them and reframing them to education contexts and settings, it would seem that in taking an Oceanic perspective of Pacific or Pasifika education (Samu, 2010), facilitates new forms of expression and identity, and encompass and absorb creative 21st century approaches to resolving issues and concerns of Pacific peoples and their education in the 21st century—such as in Aotearoa New Zealand, and the United States.

Conceptualizing an oceanic identity

A poignant piece of prose that provides the concept of Oceania with life, is a quote by elder-scholar Teresia Teaiwa. According to her close friends (Teaiwa et al., 2021, p. xv)

As the late Professor Epeli Hau'ofa was finishing his essay 'The Ocean in Us' (1998), he decided he needed an epigraph, something wise and poetic to underscore his argument for grounding regional identities in the Pacific Ocean ... Hau'ofa asked a young poet, scholar, activist, and well-known wordsmith for a line he could use. She immediately offered her now most widely circulated quote:

We sweat and cry salt water, so we know the ocean is really in our blood

Hau'ofa and Teaiwa presented and promoted the value of developing a strong regional identity for Pacific peoples. This was via the shared inheritance of the Pacific Ocean, or the Moana. A strong shared identity as Pacific Islanders/Pacific peoples/Pasifika/Moana Peoples/Oceania involves ancestral connections to the actual Pacific Ocean—and connects people in Pacific island nations, and Pacific peoples within Pacific Rim nations such as New Zealand, Australia, the United States and Canada. Scholars of Pacific Studies as a multi-disciplinary field have been strengthening such connections, and such identities across the diaspora and into the Pacific region via symposia and conferences organized and hosted by universities for many years. For example the Pacific History Association⁴ has held its biennial conference for more than 24 years. The University of Hawaii at Manoa's Center for Pacific Island Studies⁵ was established more than 70 years ago. The University of Utah⁶ organized a two-day virtual symposium in 2021 entitled "Pedagogies for Indigeneity and Diaspora: Pacific Studies at Home and Abroad". Comprehensive, in-depth transnational research studies of the Pacific and Pacific diaspora and the sharing of new knowledge and perspectives demonstrate that critically important conversations are occurring at that level. I argue that something similar should be nurtured and developed in terms of specific conversations across the Pacific diaspora about education and leadership, particularly education initiatives for and by Pacific peoples.

⁶<https://transform.utah.edu/pi-studies/symposium/>.

A conceptual challenge from the past

In 1985, Tongan scholar and philosopher, Epeli Hau'ofa issued a thought-provoking challenge to the “educated, relatively wealthy urban-based local elites ... locally instrumental in deciding the directions of change” (p. 163). He considered them paradoxically, as both a potential threat to the survival of “the indigenous elements of traditions” and potential change agents drawing on “the rich heritage from the past” (p. 166) to produce new images, new voices for the Pacific. The spatial focus for his writing was undoubtedly nations of Pacific the Pacific region. However, his essay also reflected the growing sense of political, economic and cultural connection as Pacific peoples “toward” the rest of the world, including recognition of negative external influences, particularly those from powerful and influential colonial/former colonial nations of the Pacific Rim such as New Zealand, the USA and Australia. That was then (the mid 1980s). What about now?

I believe his challenge is pertinent for very different 21st century metropolitan contexts and settings—within which “new”, quite different Pacific peoples reside, where many endeavor to survive, and not as many, regrettably, thrive. State provided education is one area which is problematic. For example, according to American Tongan activist and educator ‘Anapesi Kaili, speaking in 2012 about Pacific Islander students within the United States:

We have criticized them for not knowing their language and culture, yet we don't take the time to teach it. I have been in numerous meetings where administrators and teachers clearly do not see a need for multiple histories or epistemologies or anything that is not in par with mainstream culture and values. Yet, the minute our young people show any sign of resistance in this mainstream classroom they are labelled as having a behaviour disorder, tracked into ESL and special education courses and their Pacific cultures blamed for their so-called failures. The same culture that they are not allowed to practice or even emulate. The same culture that they hardly even know!

The inquiry and its approach

Elder -scholar Seu'ula Johansson-Fua has written simply and clearly about the value and importance of drawing on indigenous knowledges and perspectives (Johansson-Fua, 2014, p. 66) when undertaking research. She stated:

For me, as the apprentice, it was an exciting process of re-thinking about education, and about being Tongan. It was my own personal re-education as I worked with these two academics in search of a research framework that would capture the reality and truth about our world view. The Kakala research framework was a space that would allow us to be who we are, with all our insights, knowledge, experiences and inherited gifts and to position ourselves where we belong without shame or pretence. It is from this position as a researcher that we can do justice to our world view and to present an accurate account of what and who we really are.

Her wisdom resonates with me. Drawing on the concepts and ideas of Pacific elder-scholars in my search for meaning of the experiences I briefly described at in the Introduction of this chapter, and the subsequent thinking and writing involved has had a similar effect on me. I describe the personal re-education, during the process of sense-making, as the need to capture reality and “to be who we really are”.

Critical Exploratory (CE) questions

Four questions were applied to the exploration of the websites and public FaceBook pages of the four education initiatives that I selected. Three of these questions came from Hawaiian scholar Benham (2006, p. 45) who posed them when she was speaking over a decade ago to Native Hawaiian and Pacific Islander scholars about their research. I refer to them as Critical Exploratory Questions or CEQ.

Critical Exploratory Question 1:

Does it meet a high standard of social justice that ensures freedom to self-determine and plan for future progress?

Critical Exploratory Question 2:

Does it ask important questions that move us and others to transform our thinking and generate new ways of viewing learning and teaching that make a difference?

Critical Exploratory Question 3:

Does it invite to the conversation voices of cultural experts, elders, families and communities?

I argue that these questions reflect Wendt's views (1976) that our efforts must be counter-hegemonic; must recognize multiple Pacific worldviews; and must draw on indigenous epistemologies.

I add a fourth question, one posed by Haig-Brown (2012, p 74). She argued that such a question is necessary for the long process of decolonizing our countries and our lives, even when “our country” is a nation in which we or our parents or even grandparents settled. Her argument is about the need to educate ourselves, as diaspora, about the lands, histories and cultures of First Nations peoples, or Tangata Whenua.

Critical Exploratory Question 4:

“Whose traditional land are you on?”

The selected education initiatives

A distinguishing feature of these initiatives is that they are led by professional, urban-based, well-educated, bicultural, bilingual, relatively young members of their respective “local” Pacific communities (I define “young” in this instance in a culturally subjective sense—it means younger than I am by at least a decade and a half). Examples of local communities include West Valley, Utah in which Mana Academy is located; and Mangere East, south Auckland in which Rise Up Academy is located. Auckland is the main site for the Mana Moana Leadership program, which has national scope. Hawaii is the site for the National Pacific American Leadership Institute’s national leadership program.

Mana Academy (West Valley, Utah, USA)

Mana Academy is the first Pacific focused Charter school to be established in the world. It offers full primary schooling, and secondary schooling up to Grade 11, and is located in West Valley, in the state of Utah, the United States. Established in 2013, plans are currently underway to mark its ten year anniversary in April, 2023. In the academic year that ended in June of 2022, Mana had a student enrollment of 313 students. 49% of student enrollment identified as Native Hawaiian or Other Pacific Islander (NHPI) and 43.4% identified as Hispanic/Latino. Half the student population is defined by the state as being economically disadvantaged, and 97.1% as minority enrollment.⁷

According to its website, Mana Academy’s Mission is to “develop scholars who are rooted in their native cultures and are prepared to be the leaders of tomorrow”. Mana Academy’s Vision⁸ is as follows:

Mana Academy Charter School is a *community and family centred* school committed to *educational excellence* and *cultural sustainability*. Our administration, teachers and parents *work together as partners* to enhance the academic achievement and learning of all students. We provide a learning environment that is *culturally relevant and inclusive*. We strive to meet the needs of all learners by designing academically challenging work that is meaningful, engaging and inspire innovation, exploration, discovery and creativity. We empower all students to access, enrol and graduate from college.

All students who graduate from Mana Academy will be equipped with the necessary knowledge and skills to be successful leaders and positive agents of change in their local, regional and global communities (emphasis added).

Mana Academy Charter School’s Facebook public page features school activities and celebrations for secondary students, marking the end of the 2022 academic year (emphasis added).

From June 13, 2022:	• Our Mana Academy class of 2022 Salutatorian ... performing her final <i>Tongan tau’olunga</i> ... at our graduation ceremony • Our secondary campus scholars performing a <i>Samoaan sāsā</i> choreographed by Mana alumna and teacher ... This sāsā tells of the different legends of Polynesian Demi-God Maui when he fished up the islands, lifted the sky, snared the sun and brought fire to his people
From 11/6:	• Our class of 2022 have all been accepted to the college/university of their choice, <i>received full ride academic scholarships</i> and will begin their college career this coming fall.
From 1/6:	• Our elementary scholars <i>singing Nga Iwi e, composed by The late Hirini Melbourne, a Maori songwriter</i> and poet joined by a performance by some of our 3rd and 4th grade scholars. • Our high school scholars <i>performing a Norteno tribal</i> choreographed by our 10th grade scholar ... Norteno Tribal is native to the Mexican states of Sonora, Chihuahua, Coahuila and Nuevo Leon. The Norteno was developed from blending of the Mexican and Spanish musical traditions, military band instrumentation and Germanic musical styles such as polka and the waltz

I have selected these recent posts in order to provide insight into what “cultural sustainability”, “culturally relevant and inclusive” as well as “academic excellence” seems to look like for Mana Academic Charter School.

In addition, I share a post from the principal’s FB page. In 2018, I asked for her permission to use a specific photograph and her description of it for a presentation. The photo was from a visit to Mana Academy by His Highness Tui Atua Tupua Tamasese Ta’isi Tupuola Tupuola Efi and his wife, Masiofo Filifilia Imo, of Samoa. Tui Atua is a highly esteemed Samoan indigenous knowledge holder, with an international reputation as an academic scholar. The principal wrote the following (emphasis added):

Today our elementary scholars presented traditional gifts to His Highness Tui Atua Tupua Tamasese Efi and Her Highness Masiofo Filifilia Tamasese. We presented our gifts in the order of our migration to Utah.

⁷<https://www.usnews.com/education/k12/utah/mana-academy-charter-school-147712>.

⁸<https://www.themanaacademy.org/about>.

Our first presenters were our Navajo scholars representing the indigenous people of the land, followed by our scholars from Mexico, representing our Latinx community, then our Hawaiian scholars, Samoan scholars, Tongan scholars, Maori scholars and finishing up with our Marshallese scholars.

They were so moved by the fact that all gift presentations by our scholars were done in their native languages.

I took the Critical Exploratory Questions (CEQ) and applied them broadly.

CEQ1: Cultural graduation celebrations signal “freedom to self-determine and plan”, given the highly charged issue of high school bans on cultural attire during graduation ceremonies in other parts of Utah state. It made news via Maori media⁹ in New Zealand in June of 2022, when a young Samoan student made a formal appeal in the Jordan District of Utah, to overturn a by-law passed in December of 2021, forbidding high school graduates from wearing cultural items on top of their graduation regalia.

CEQ2 & CEQ3: Mana Academy offers a school curriculum in which all students are exposed to and learn from and about, the cultural groups represented within the school (Tongan, Hawaiian, Samoan, Marshallese, Hispanic and Navajo). Its website profiles staff, including a Culture Team of cultural teachers and mentors.

CEQ4: Learning about the indigenous peoples of their location is an explicit part of their school curriculum regardless of whether or not any students identify with the specific tribes whose lands the school and surrounding community are located on.

Rise Up Academy,¹⁰ Rise Up Trust¹¹ (Mangere East, South Auckland, New Zealand)

Rise Up Academy began in 2014 as a full primary Charter school via education policy changes instituted by a National government. It was founded by Rise Up Trust, a not-for-profit organization established in 2006. Rise Up Academy transitioned into a Designated Character School in 2019 (under a Labor government). Rise Up Academy’s website states that their special character consists of “A Hearts and Minds based Inquiry Learning model, which reflects Maori and Pasifika values. When we enroll your child, we enroll your whanau. Culturally responsive Whanau mentoring programmes.” Rise Up describes its vision and mission as the development of “SHARP minds, STRONG bodies and GOOD hearts by RAISING Leaders, one child at a time”. It states:

This acknowledges and reflects our shared Pasifika values – Mark 10:27. “Love the Lord your God with all your heart and with all your soul and with all your strength and with all your mind and, Love your neighbour as yourself”.

The whanau or family mentoring programmes are an important feature of Rise Up Academy. These programmes are also a requirement of parents/caregivers who enroll their children. Take, for example, the eight week Hearts and Mind course. It equips parents with the keys to unlock their child’s potential and engage with their learning. It is intended to enable parents to “feel empowered as they understand the connection between their child’s learning style, love languages and personality type and the best way to develop the child’s thinking and problem solving skills”. Another example of a key whanau program is Synergy, a “family program involving three way learning, where Whanau Educators take parents and their children through real life problem solving strategies. Through the Inquiry Learning Model and real life scenario the whanau plan a presentation about their child, which is presented by the child on the last evening.” Culture and identity is one of the seven stated objectives of the Synergy program. This program runs for seven weeks, in weekly 1.5 h sessions that occur in the evenings after work.

In her welcome statement on their website, the CEO of Rise Up Trust (who is also the principal of Rise Up Academy) stated the following:

For 15 years Rise UP Trust has partnered with our community to celebrate Pasifika uniqueness. With collective strength we have challenged, changed and lifted educational achievement and well-being in our community.

As a premium provider of evidenced based whanau engagement we have grown from a garage home-school, established The Rise UP Academy – Designated Character School and continue to address intergenerational disadvantage through the Building Learning Communities project.

In partnership with The Foundation North we are committed to a 10 year longitudinal study to track the learning journeys of a focus group within our community.

⁹<https://www.teaomaori.news/utah-polynesian-community-wins-appeal-wear-cultural-attire-graduation>.

¹⁰<https://www.riseupacademy.school.nz/building-learning-communities/>.

¹¹<https://www.riseuptrust.org.nz/>.

There is a Learning revolution going on in South Auckland and we welcome your support or expressions of interest in our programmes.

Rise Up Academy is the only one education initiative in this exploratory study that has been involved in sustained evidence based research studies of its services and practices. At least three quality assured academic publications have been produced from research activities to date (the most recent being [Sharp et al., 2020](#)).

After a broad application of the Critical Exploratory (or CE) questions:

CEQ1: Rise Up's well-documented history from an informal Saturday school in a family garage run by two Pacific primary school teachers, to a community trust to a school reflects the determination of its leadership to achieve a specific vision for Pacific learners and their families in south Auckland, in local board areas of Mangere-Otahuhu; Otara-Papatoetoe and Manurewa. Rise Up's development has been astute and strategic, drawing on one specific philanthropic source that shared their vision, collaborated with them to build their capacities and capabilities in alignment with the series of goals they set for themselves.

CEQ2 & CEQ3: The primary focus for Rise Up was on building up parents, to empower them in their efforts to effectively support their children's education, and strengthen their families. When the Trust established the school, parents were required to commit specific hours to serve and support the school (reciprocity) and to take the courses. Home-school partnership takes on different meaning when comparing Rise Up Academy to most "mainstream" schools in the New Zealand education system.

CEQ4: On the basis of the website scan or brushstroke, this CE question is not strongly evident. This does not mean it is absent, or goes unaddressed. Foregrounding matauranga Maori in relationship to Rise Up as a school is not evident within its online presence.

Mana Moana¹² (National Leadership Program, Aotearoa New Zealand)

Leadership New Zealand¹³ was established in 2003, and its overall purpose is "to create a connected community of leaders working together for a more just, equitable and sustainable Aotearoa". The Mana Moana Experience was launched in 2019 as one of four leadership development programmes offered by Leadership New Zealand. The website describes the Mana Moana Experience as an integrated program for Pasifika leaders. It "brings together the experience, expertise and networks of Leadership New Zealand and a research-based indigenous knowledge-derived specialist program created out of the post-doctoral research" of the Mana Moana Experience program director.

Mana Moana is designed for mid-career Pasifika leaders. It involves six three day retreats over a period of eight months. The program involves peer coaching and small group contact between whole-cohort retreats. Each retreat focuses on "a significant broad issue/theme that is critical and relevant to key issues facing the Pasifika community and New Zealand". Other program features include:

- the vitalization and mobilization of indigenous Pasifika languages, knowledge, values, culture, ways of knowing and viewing the world.
- the understanding that Pasifika ancestral cultural resources are fundamental and essential for optimal contemporary living and leadership.
- to succeed in Western contexts, Pasifika cultural resources are seen to be a source of advantage, pride, competitive edge, x-factor, complexity, cognitive flexibility, neuroplasticity, polycultural capital and a way of reaping the diversity dividend.

"This is leadership for a new era, drawing on ancient indigenous resources".

In order to capture a glimpse of the possible nature and tenor of aspects of the Mana Moana Experience, I invite readers to peruse "Our Ancestors Speak", described as a powerful short film work that is a call to arms for people across the Pacific and globally. Mana Moana -Pacific Voices¹⁴ is not directly associated with Leadership New Zealand's Mana Moana Experience. However its program director has curated this "... collection of emotive and artistic video works that have been created to amplify and support the Pacific drive to global action to reduce greenhouse emissions".

Based on a broad application of the Critical Exploratory (or CE) questions:

CEQ1: The focus on the development of an explicitly Pacific leadership, in which Pasifika cultural resources are more than sources of self-esteem and pride, but are identified and used as capital for good leadership and success seems to explicitly contribute to self-determination and planning for "future progress".

CEQ2: From the description of the program, and the participants' immersion within an indigenous framework for learning, it seems the potential for new learnings that "make a difference" is high.

CEQ3: This appears to be a program that includes cultural knowledge holders and experts and elders—but perhaps not families, given the residential retreat nature of the activities.

¹²<https://www.leadershipnz.co.nz/mana-moana>.

¹³<https://www.leadershipnz.co.nz/about/about-us>.

¹⁴<https://www.manamoana.co.nz/pacificvoices/>.

CEQ4: Learning about the relationship between Maori and Pacific peoples in Aotearoa New Zealand is deeply embedded in the program design and is an explicit part of the learning experience.

The National Pacific American Leadership Institute¹⁵ or NAPALI (National Leadership Program, Hawaii, USA)

NAPALI is a “non-profit tax exempt organization” that has been running since 1998. It provides Native Hawaiian and Pacific Islanders the opportunity to learn about Servant Leadership and to harness their own cultural heritage to be a better leaders. Their Mission statement states the following:

The Mission of the National Pacific American Leadership Institute (NAPALI) is to identify, train, and nurture Pacific American Emerging Leaders. NAPALI is unique in that it conducts the only leadership program in the nation that integrates the leadership values of Pacific American cultures and Western Society.

It is committed to making a difference in the quality of life of Americans who trace their ancestry to the indigenous peoples of the Pacific islands - American Samoans, Chamorros, Fijians, Maoris, Native Hawaiians, Tongans, Tahitians, and others connected with Pacific American cultures.

Over the 24 years since it began, 310 Fellows have graduated from the program. Here are extracts I have selected from the website to provide insight to the nature of the program that NAPALI offers (emphasis added).

- NAPALI ... educates and trains emerging Pacific American leaders to build upon *traditional cultural values* in understanding, harmonizing and applying leadership theories and skills necessary for achieving personal and professional growth, greater responsibilities, and a *higher level of service to our communities and country*.
- This course is based upon the belief that indigenous Pacific Americans have an established historical basis for their core values and norms, and that they will act in accordance with them as long as these values and norms are relevant in today's society.
- The course curriculum focuses on empowering participants by helping them *understand key cultural individual and collective* Pacific American values; how these values shape attitudes and perceptions; how they were expressed in leadership skills and practices; how they *fit into the dominant society*; analyze universal leadership attributes, skills and actions which increase potential for success; and *build bridges between cultural values and leadership skills for Pacific Americans and the dominant Western culture*.

The course consists of a one day multi-site session prior to a 78 h seminar conducted over a consecutive 8-day period in a setting conducive to learning, thinking and sharing.

After a broad application of the Critical Exploratory (or CE) questions:

CEQ1: The information on the NAPALI website is succinct, to the point. The broad, brushstroke application of this particular question did not yield anything particularly definitive other than an indicator that over the eight day course, career goal setting and personal development planning and presentation are intended activities.

CEQ2: A focus on specific cultural values occurs between Day 2 through to Day 6 of the residential program. It is interesting that while no specific details are provided, indigenous cultural activities are scheduled alongside activities that at first glance could be assumed to be the expected curricula for generic leadership development programmes (e.g., “public policy agendas” and “ethics and compliance”). The available photographs of previous groups show learning taking place outdoors in Hawaii—in taro patches, on board traditional Polynesian double hulled canoes with participants wearing clothing suited for active outdoor activities rather than corporate wear within conference centers.

CEQ3: Indigenous cultural elders or knowledge holders are described (and appear in photographs) as being an integral part of the program in addition to university based academics and scholars. Given that participants are selected from around the United States, and the residential or retreat nature of the eight day course, it not a program that can easily involve families.

CEQ4: I have inferred, based on the available text and photographs of the website, that participants experience indigenous Hawaiian culture, values and beliefs, which makes sense given the location of the retreat.

Key insights, preliminary conclusions

In some ways, the so-called new conversation I am calling for leveraged off an internal one that I began to have when I began to notice, observe certain education initiatives. Like Johansson-Fua (2014), I have been involved in an intriguing and at times exciting process of re-thinking about the education, development and engagement of Pacific peoples within the diaspora. The observations followed by aspects of this exploratory study has been a personal re-education for me.

I chose four to explore—two charter schools, two national Pacific leadership programmes, two different geographic settings, both Pacific diaspora. The others that caught my attention included a school to university pipeline project at Griffiths University

¹⁵<https://www.thenapali.org/>.

called the Griffith Maori and Pasifika LEAD¹⁶ (Legacy, Education, Achievement and Dream) Program, in Queensland Australia; Le Fetuao¹⁷ Samoan Language Center, a non-profit community organization in Honolulu, supporting young Samoan children to learn their heritage language and culture. It has strong partnerships of the University of Hawaii-Manoa's Samoan Language Program, churches and businesses. In 2015, I also came across an education program supporting Pacific and Aboriginal professional rugby league players prepare for life after professional sporting careers. A key partner with the Australian Rugby League Union was Australia National University or ANU (Canberra).

So, what have been key insights for me? I identify and share my reflections of three key learnings or sights.

(i) *Revise the Critical Exploratory Questions*

Perhaps the set of Critical Exploratory Questions that I "found" in my reading and reflections merely confirm the features that caught my attention, and their application confirms what I see as being of value—in terms of initiatives that are innovative; designed to respond to specific, contextualized contemporary needs identified by savvy, strategic minded Pacific community leaders and educators rather than state authorities; informed by indigenous Pacific values, cultures, ways of knowing and being; and implemented by Pacific leaders who have formed collaborations with universities, philanthropic organizations and other relevant entities.

If I were to explore further (in a subsequent study) I would reshape or adapt the CEQs as follows:

CEQ 1: This question might need to be reversed to "Does this initiative ensure freedom to self-determine and plan for future progress thereby ensuring a high standard of social justice?"

Or perhaps it should read "Does this initiative ensure the exercise of oceanic *agency*, thereby ensuring progression toward *equity* and *social justice*?"

CEQ 2: This question could also be reversed, to become "Does this initiative move those involved to transform their thinking; generate new ways of learning and teaching that make a measurable difference; and promote new questions?"

CEQ 3: I think this question could remain as it is currently.

CEQ 4: This question is far more important than I realized—so much so, that I have reflected on it in the next sub-section.

(ii) *The Importance of Decolonizing Pacific Perspectives of Place*

If a Pacific education or leadership initiative is explicit and purposeful about decolonizing leaders must take cognizance of the relationship between themselves as Pacific, and the indigenous peoples of the land. According to Haig-Brown:

I consider the possibility of decolonizing discourses of diaspora, by asking the central question not only where people of the diaspora come from, but *where have they come to?* (2012, p. 74, emphasis added).

In the context of Aotearoa New Zealand, according to Teaiwa and Mallon (2005), it is not uncommon in formal ceremonies for Pacific visitors to be welcomed and greeted by Maori as *tuakana*, or elder sibling. However, in the realities of contextualized encounters, relations can be one of "ambivalent kinship" (2005, p. 208), where depending on the specifics of the encounter or situation, there may be "a denial of kinship; or an assertion of seniority within a kinship model; or it may produce moments where the representation of a 'united happy family'" appears best. It is this kinship position that seems to be an appropriate inclusion for a reflective response to Haig-Brown's question. The Health Research Council (2014, p. 2) in New Zealand has what I consider to be a robust, astute answer:

Pacific peoples acknowledge, support and respect Te Tiriti o Waitangi as the foundation for their relationship with Tangata Whenua and recognise the Tangata Whenua status of New Zealand Maori and their right to exercise tino rangatiratanga. Pacific peoples also recognise the mandate accorded under citizenship rights and the entitlements that comply with international declarations and other legal instruments regarding the rights of human beings. Pacific peoples and Tangata Whenua are related and bonded culturally and geologically through the Moana Nui a Kiwa (greater Oceania kinship connections). This relationship is embedded in history, mythology, and cosmological beliefs, and transcends state boundaries and legal jurisdictions.

It means relevant, deeply thoughtful and authentic perspectives of the lands and histories of the people of the lands in which we as Pacific reside should be integral in the learning experiences that Pacific education initiatives design because they are part of our Pacific diasporic identities.

(iii) *Oceania as Relational Space*

According to Pacific elder-scholar Eve Coxon (2011), Epeli Hau'ofa's "influential vision" promoted "a revitalization of the pre-colonial historical interconnectedness" of Pacific peoples and "the development of extensive and expansive new connections with the countries of the Pacific Rim". She stated:

By reclaiming the term 'Oceania', he re-conceptualised the embodied life experiences of Pacific peoples by focusing not just on their small islands (their *places*) within the vast ocean, but on the varied *relationships* maintained over many centuries throughout the Pacific Ocean, their shared *space*, which

¹⁶<https://www.griffith.edu.au/student-support/outreach-and-engagement/pacific-islander-and-maori-student-outreach>.

¹⁷<http://www.lefetua.org/>.

more recently have given rise to new relationships with places on the Rim. Oceania is thus a *relational space*, a “much enlarged world of social networks that crisscross the ocean all the way from Australia and New Zealand in the southwest to the United States and Canada in the northeast” (p. 6)

It makes sense that the new connections she refers to are inclusive of places *within* the Rim nations, in which Pacific-heritage communities have settled, become established, and endeavor to become valued strands of the fabric of those societies.

It is specifically Pacific social networks, facilitated by 21st century technologies and modes of connection (social media platforms such as Facebook), that drew me in different ways to notice, observe grassroots initiatives in these outer reaches of Oceania. For example, when my younger sister and successful author of Pacific young adult fiction was invited to carry out a speaking tour in West Valley and Salt Lake City Utah in 2014, I joined her to provide big-sister moral support; to observe and meet community leaders and educators in this surprisingly sizable “pocket” of Pacific peoples that I had not been aware of until then.

This was how I first came to visit Mana Academy and meet the principal, deputy principal. It was through their social media posts that I became aware of the National Pacific American Leadership Institute (the Mana Academy principal is a Board member) and held initial discussions about it in subsequent interactions with Mana Academy leadership when they came on an education study tour to Auckland in 2016, and when I visited Mana Academy during my research and study leave in 2018. From 2014 through to the present, I became more involved with the American Research in Education Association (AERA) Indigenous Peoples of the Pacific Special Interest Group (IPP-SIG). Through IPP-SIG, I met and reached out to young emerging United States based Pacific doctoral scholars who turned out to be either NAPALI Fellows or were intending to apply to the program.

In 2016, I was formally approached to be the Pacific research advisor for a longitudinal project, Ngā Tau Nguahuru “Looking Beyond for Ten More Years”, a study into “success” as Maori and Pacific. It grew out of Foundation North’s Maori and Pacific Education Initiative 2009–2014. Foundation North is a major (in terms of scope and funding capacity) philanthropic organization, serving Auckland and Northland for over thirty years. This was how I became re-acquainted with Rise Up Academy. And then there’s my cousin who as then CEO of Leadership New Zealand, facilitated the establishment of the Mana Moana Leadership Experience. I began to follow its progress through her social media posts after its’ launch in 2019. Interestingly, the main funder for the Mana Moana Leadership program has been Foundation North.

What are the preliminary conclusions of this exploratory study? I identify three.

(i) *“When the answers are within us”*

Each initiative attests yet again to Pacific peoples capacities to draw on their resources and in collaboration with others, develop innovative strategies which hold the potential for meaningful change—particularly in the contexts, settings (such as the United States) where the initiatives rely far more heavily on Pacific peoples and their communities. We are fortunate, in Aotearoa New Zealand, that given the demographic profile of Pacific peoples, national education and social policies are in place that specifically target Pacific peoples because this population is a strategic priority. This has influenced both the private sector and the philanthropic sector, in terms of funding decisions.

(ii) *Counter-Hegemonic*

These initiatives are examples of education collaborations intended to be counter-hegemonic. They also represent efforts to decolonize the education of Pasifika learners. This is evident in the development and use of conceptual frameworks informed by indigenous knowledge and values; the foregrounding of heritage languages as assets for learning success and pedagogical responsiveness to the unique identities of the Pacific learners, their families and communities.

(iii) *The need to learn more*

To reiterate, this study was part of an exploratory, contemplative process of inquiry, one holding significant potential for deeper theorizing, more intensive examination. There is a case for the design and implementation of an over-arching, more comprehensive research project, one that examines rather than explores the strengths of these innovations and the outcomes for Pacific learners, participants and their families and communities.

Overall, this exploratory study draws attention to Pacific leadership, particularly the type of leadership that Hau’ofa believed was crucial for Pacific futures. I believe the leadership of the two quite different Pacific charter schools reflected that form of stewardship. The two different Pacific leadership programmes appear to focused on development of ‘that type’ of Pacific leadership. By virtue of their nature and structure, the two Pacific charter schools have developed incredible distinctive curriculum and learning programmes. They have responded to their respective visions for education of Pacific learners through deliberate purposeful design, the extent of which would be very challenging to achieve in “mainstream” state schooling.

I end this chapter with this quote by Benham (2006), which captures the essence of these education initiatives:

Keep this in mind: If it is not us, then who will do this and to what end?

Let us be the ones to answer the question:

¹⁸Benham (2006, p. 45).

'Where can we collectively be that is greater than where we are now?'¹⁸

Introduction

Western psychology is often conceptualized as the study of the mind and behavior. Yet, western psychology as a field of study and practice is young-only developing since the mid to late 1800s (Asthana, 2015). According to the Merriam-Webster dictionary (Merriam-Webster, 2004), the word “psychology” originates from the Greek language with *psychē* meaning “breath, principle of life, life, soul,” and *logia* meaning “speech, word, reason.” Though great variation exists, there are commonalities between this western definition of psychology and the worldviews among over 476 million global Indigenous peoples speaking more than 400 distinct languages, including 5.2 million residing in North America (Worldbank, 2022). Similar to the Greek definition of psychology, many Indigenous cultures incorporate elements of the soul/spirit and words/reasoning into views of health (Struthers et al., 2004). As the first author was culturally instructed, our breath flows through us from our ancestors, guiding us with their loving touch. We carry this ancestral breath toward the future through our sacred bones (see Fig. 1). As we stand upon the ground connected to *iholitopa ishki*/mother earth, being embraced by the skies, we are unified and can be in a state of health under our ancestors’ watchful gaze and direction. To us, the concepts of *breath* and *life* are sacred, and words are seen as powerful in extending knowledge from our bodies to the world around us and beyond. These words and teaching are not distinct from our mind or body

Fig. 1 Ancestral Mississippian shell engraving. <https://peachstatearchaeologicalsociety.org>.

and can be embodied during knowledge exchange, as seen within Indigenous worldviews across the globe (Batacharya and Wong, 2018).

Despite these initial overlaps in terminology, western psychology is shrouded in a cloak of oppression within Indigenous communities. As a colonial tool, it has objectified Indigenous peoples as “primitive” and “inferior” to whites in order to justify further trauma (Garth, 1931; Walker, 2018). With both Indigenous authors being raised in Oklahoma, they both often witnessed the need for psychological services. For instance, American Indian children have the highest depression rates than any other racial group in the US, as well as disparate rates of substance use disorders, post traumatic stress disorder, and suicide (American Psychiatric Association, 2017). Many are in dire need of emotional and social support to cope with historical and current traumas. Yet, there continues to be difficulty in accessing behavioral health services including long waits, few providers, and limited access to Indigenous traditional healers- if preferred (American Psychiatric Association, 2017; Aronson et al., 2016; Gone and Trimble, 2012). Furthermore, Indigenous communities often perceive western psychology as having high risks. Recent research has found that Indigenous communities can view western psychology as belonging to a foreign culture, or as being “white” (Gone, 2007). This may be due to differences in function and treatment. For instance, most western healing practices relegate spiritual health to spiritual healers, who are seen as distinct from health professionals; while Indigenous healers often address physical, mental and spiritual ailments at once viewing them as interconnected (Johnson-Jennings et al., 2018). Therefore, western psychology may not always be appropriate or effective for Indigenous patients. In addition, the history of western psychology continues to influence Indigenous community perceptions. As an Indigenous psychologist, the first author has heard Indigenous community narratives of psychologists, and their patient records, ending up in court to testify against Indigenous peoples, even for minor infractions. Many of these narratives culminate with stories of imprisonment of the community member(s) and, or removal of Indigenous children. In other words, the community, as whole, can experience large gaping wounds stemming from using western psychology. However, its not only the recent trauma that echoes across Indigenous communities and builds distrust, but also western psychology’s history of systemic oppressions. In particular, western psychology has been plagued by its systematic contribution to the genocide of Indigenous peoples using eugenic tactics, since its inception (Ilyes, 2020).

Given access issues to both western and traditional healing methods and varying cultural beliefs among Indigenous peoples, western psychology might be preferred and, or be the only avenue for Indigenous populations given the disparate mental health needs, as related to historical and, or ongoing systemic racism. Therefore, both western psychology and Indigenous psychology continue to be needed for Indigenous wellness (Aronson et al., 2016; Gone and Trimble, 2012). For instance, despite western medicine fragmenting healing by relying upon healing methods that compartmentalize- the body, mind, and spirit, it may still prove useful to Indigenous populations if employing appropriate care, cultural empathy, and overall respect (Goodkind et al., 2015). Yet, a need persists for western psychology to be decolonized in practice, education, and research. Despite western psychology having dominated medical approaches to healing beyond the physical body, many Indigenous psychologists have, remarkably, indigenized their psychological practices, research, and education. However, instead of developing a field of “Indigenous psychology” as grounded in Indigenous worldviews, international Indigenous scholars have argued that many have only imposed Indigenous elements onto the western psychology framework (Marsella, 2006). Some may call this, colloquially, as adding a feather (Walters et al., 2020). Though this may be the case for some, other revolutionary psychologists, such as Dr. Mason Durie indeed grounded his Te Whare Tapa Whā model in Indigenous worldviews (Durie, 1994). Though focused on a specific Indigenous group, Māori, this model inspired generations of Indigenous students across the globe to pursue psychology, such as the first author. Within this chapter, the authors (i.e., being Indigenous scientists, one psychologist and one health educator) will briefly discuss western psychology drawing from a decolonial and indigenist lens with the hope of supporting social transformation in practice, research, and education. To do so, western psychology’s foundation in racism and eugenics, as well as the appropriation of Indigenous psychology will be discussed. However, one cannot discuss these atrocities without uplifting Indigenous psychology and the thriving of Indigenous peoples today, which includes revitalizing and reinventing Indigenous healing methods, which will also be introduced.

Decolonizing psychology

As represented in Fig. 2, academic elder, Dr. Tuhiwai Smith (Smith, 2021) argues that decolonizing is a risky but necessary endeavor when working with Indigenous knowledges and ways of being. She provides a framework that has advised numerous Indigenous

Fig. 2 Tuhiwai Smith's (2021) decolonizing framework: Risky Business.

academic descendants, as well as allies, who seek to decolonize. She proposed that one must simultaneously unmask Indigenous knowledges, such as Indigenous psychologies and healing practices that have been subjugated by western psychology. As well, Tuhiwai Smith's encourages academics and others to actively create space for Indigenous voices-while challenging ethnocentric racism, both historically and present. To seize Tuhiwai Smith's call for activism within the field of psychology, for the psychologists, scientists, and educators must recognize the many social injustices that western psychology has committed against Indigenous peoples and challenge these ongoing colonial notions. In particular the historical and ongoing use of psychology to other Indigenous peoples and frame them as the deficit (Hartmann et al., 2019; Walker, 2018) must be addressed. This deficit approach in practice and research can be seen with the reference point, or norm, of "psychology" being European and, or western, white settler culture. Though found ethnocentric, western psychologist often advocate that their theories have accounted for scientific unbiases through "rigorous western methods" (Sherif, 1979). They further frequently ignore biased cultural influences on leading theorists. Therefore, a decolonial approach to psychology is necessary to move the field forward, to rebuild, and to effectively train psychologists and other mental health providers, educators, and scientists.

The colonial tool of western psychology and eugenics

"If there is to be reconciliation, there must first be truth.- Timothy Tyson remarks regards to the Truth and Reconciliation Commission of Canada (*If There Is To Be Reconciliation, There Must First Be Truth* – KapitalFM 92.9 Abuja, n.d.)

Western psychology has served as a colonial tool of genocide from early on in its development, as aforementioned. During the 19th and 20th century, western psychologists sought to relegate Indigenous persons as inferior. The Eugenics movement, which argued for "the practice or advocacy of controlled selective breeding of human populations (as by sterilization) to improve the population's genetic composition" (Merriam-Webster, 2004), took root in western psychology, forming the backbone of many practices. In particular, Indigenous culture, behaviors, and thoughts were deemed inferior and of lower intelligence than that of western, white settler families. The IQ test gave "evidence" to the racist notion of white settler superiority, while framing Indigenous adults and children as "feeble minded" (Walker, 2018). Scholars have since exposed the intertwinings of the Eugenics movements with western psychology's inception (Buss, 1976, Levine, 2016, Yakushko, 2019). However the impact on Indigenous communities has not often been addressed.

Eugenics psychology and intelligence testing were particularly problematic in increasing systemic racism. The results of these biased tests on Indigenous peoples informed policies and law (Levine, 2016; Yakushko, 2019). Terman, a Stanford University Eugenics proponent, standardized Alfred Binet's IQ test for the US. Unfortunately, he drew from his biased views of genetic and race based intelligence to retain culturally biased tests, and, or modify scoring scales to support views of inferiority. In doing so he reinforced that American Indian children, as well as Mexican American and Black, or African American, children were the deficit, or exhibited a presumed "feeble mindedness" (Terman, 1916). In doing so, he and his team tested, validated, and promoted inherently biased IQ tests that persist today. These racist biases can be seen within Terman's writings:

It is interesting to note that M. P. and C. P. represent the level of intelligence which is very, very common among Spanish-Indian and Mexican families of the Southwest and also among negroes. Their dullness seems to be racial, or at least inherent in the family stocks from which they come. The fact that one meets this type with such extraordinary frequency among Indians, Mexicans, and negroes suggests quite forcibly that the whole question of racial differences in mental traits will have to be taken up anew and by experimental methods.

Terman (1912/2007, p. 456).

To reify this "evidence," white settler children's scores were compared to Indigenous children, who were most often those who were forcibly and imprisoned within a boarding school and likely had no interest in completing these foreign tests. At the same time, Indigenous children were often experiencing human rights violations including rampant physical, mental, and sexual abuse, and forced child labor. As Dr. Dorothy Leighton found in one boarding school alone, over 40% of the children were malnourished as well as other untreated ill conditions (Schuck et al., 1964). However, Terman's researchers who helped norm and test the initial Stanford-Binet IQ test also held attitudes such as Rowe (1964) below:

The striking difference between the Indians and the two groups of white children cannot be explained by hygienic, social and educational differences ... Moreover, many of the children examined had spent three or more years at the government school where good food is plentiful and the school conditions at least average. The children go to school one half day and work the other. The half day of work is also educational in that each child is taught some trade or occupation. It seems therefore that the only satisfactory explanation of their inferiority in terms of the tests is to be found in an inferiority of native ability.

P. 456 Rowe (1914, p. 456).

With such a biased view towards the 268 Indigenous children who were made to take this test, the researcher continued to rationalize racist views of inferiority. Notions of second language acquisition, foreign cultural concepts, and, or not wishing to take such the test did not seem to occur to the researcher.

Western psychology continued to promote intelligence and aptitude tests to justify stereotypical notions of feeble mindedness toward Indigenous children. The IQ test, and a subsequent feeble-mindedness diagnosis, was used to track Indigenous children into subpar “special education.” Even in the late 1980s, the IQ tests were argued to *not* be culturally biased, as both teacher subjective assessments and scores were similar, despite the obvious cultural biases that may be shared between the two (Reschly, 1980). Today, inherently biased IQ tests continue to be utilized to track students in education and limit their opportunities (Morrier and Gallagher, 2012). Testing has further been used as a colonial tool to take children from “feeble-minded” Indigenous mothers. Approximately 25%–50% of all American Indian children had been removed to foster care or boarding schools by the 1940s (Abourezk, 1978). Sometimes, these tests would result in families having their land, money, and rights taken away due to their incompetence, or feeble-mindedness diagnosis (Flynn, 1988). Thereby this western psychological intelligence testing, and resulting stereotypes of Indigenous persons as inferior and unworthy of human rights, disrupted families across generations and led to continued subjugation, unjust policies, and violence. For instance, a US national Indigenous insane asylum operated from the early 1900s until 1933 with children and adults from over 52 tribes being forcibly admitted and held-most without a diagnosed mental health disorder. Children, as young as age 2 years, were admitted for causing problems at school and for their families not giving up “primitive” Indigenous cultural practices. Each inmate received unethical and deplorable treatment (Dilenschneider, 2013). This asylum, and related psychological “treatment,” have had long lasting and profound effects on Indigenous communal views on mental health practices and the legitimacy of such.

Western psychology’s eugenic roots and testing further promoted the genocide of Indigenous peoples by justifying forced sterilization. Prior to the 1910 US national law legalizing forced sterilizations, several states enacted laws regarding the ability to forcibly sterilize those deemed “feeble-minded,” often targeting American Indians (Cackler et al., 2016; Lawrence, 2000; Stern, 2005). Persons would be tested and if determined undesirable, as presumed by their Indigenous race and test scores, they could then be forcibly sterilized. Over 25% of all American Indian women were sterilized by 1976, and cases continue to occur into the present 21st century (Lawrence, 2000). This has affected not only the future generations of Indigenous peoples, but violently impacted the Indigenous mothers who were still caring for the next generation. For instance, in the early 2000s, Indigenous Women who were sterilized had 2.5 times the odds of poor mental health (Cackler et al., 2016). Hence western psychology, the very field that professed to increase mental health, has been a prime contributor to inducing ill mental health and genocide against Indigenous peoples.

Another test that has greatly impacted Indigenous populations is the ADHD testing that was birthed from the 1919, *continuous mental performance attention task*, forerunner to the modern Continuous Performance Task/CPT used in the diagnostic ADHD test. While early in the 20th century, psychologist Russell Garth (Garth, 1931) argued for the statistically significant superiority of the “primitive” American Indians on this test. Some argue that the CPT test was originally utilized to demonstrate the superiority of white children over other racial groups (Garth, 1931). The test was later modified and then generated inferior scores for American Indians. Recently, on one western reservation, up to 75% of all children were likely to be diagnosed with ADHD, and Indigenous children continue to be diagnosed at much higher rates today (Walker, 2006). Given these disparate rates, CPT’s history and use in today’s ADHD diagnostic testing has been argued to support a negative racial stereotype of the “ADHD Indigenous child” (Walker, 2006). This has further caused increased intergenerational distrust and tracking of Indigenous children.

Though “standardized” intelligence or aptitude tests have been blatantly developed on racist principles, as spread from a history of eugenics, they are still in full use within educational and health settings. Furthermore, they continue to influence policies, laws, and discrimination against Indigenous persons. Therefore, to truly decolonize western psychology, our society must reconsider the use of biased testing and how it impacts Indigenous groups.

Cultural appropriation within western psychology

Though western psychology is riddled with racism, there are several foundational theories within western psychology that were influenced and, or appropriated from Indigenous cultures. One of the more famous and contested theories is Maslow’s Hierarchy of Needs. Maslow was well documented to have traveled to the Blackfoot nation and to have studied under their elders- gathering much information about their teachings, or intellectual property, of self actualization and which basic needs are necessary for functioning within communities (Blood et al., 2011). Though the tribe has always held a well-developed framework for wellbeing, the tribal elders recognize that Maslow had not completely stolen their health theory, as several aspects differed. However, they were upset that their substantial influences were not referenced (Blackstock, 2011). As Blackstock (2011) cites, “Maslow did not fully incorporate Blood First Nation understandings of ancestral, knowledge, spirituality, and multiple dimensions of reality, nor did he fully situate the individual within the context of community ([personal communication] Wadsworth, 2008). Therefore, the Blackfoot Nation and Indigenous scholars have sought to reclaim their knowledge and to voice Blackfoot theoretical views, which have been silenced and long overlooked.

Richard Katz, a psychologist and personal friend of Maslow’s surmises, “Maslow may not have elevated Siksika [Blackfoot] teachings and influence on his hierarchy of needs as he may have believed that doing so would diminish the validity of the ideas” (Kaufman, 2019). In essence Katz recognizes that western psychology and research may have quickly rejected elevating and publishing any Indigenous theories of health and wellbeing within its existing racist framework. The resistance from white settler researchers,

even today, do support this notion. For example, any online search for “Maslow” and “Blackfoot” will yield more settler paper’s decrying his connection with Indigenous knowledges than Indigenous papers discussing such. Some settlers note their disbelief that Blackfoot elders knew about Maslow’s agenda, given that they had not met him prior. Through a settler view of Indigenous inferiority, one may not be able to comprehend that Indigenous peoples have known about white settlers, and their colonial agendas for centuries and have established strategies for coping with them, far before the individual arrives on the reservation. Given these reactionary settler papers disrupting the colonial narrative will take much activism, i.e., defined as “direct vigorous action especially in support of or opposition to one side of a controversial issues” (Merriam-Webster, 2004). Indeed, we are reminded by Tuhivai Smith that decolonial “attempts to break free can involve enormous violence: physical, social, economic, cultural and psychological” (Smith, 2021, p. 27).

In the mid 1930s, Erik Erikson, another notable psychologist who helped build developmental psychology, informed his area of psychological study under the tutelage of Indigenous knowledge keepers from the Lakota and the Yurok Nations (Erikson, 1945; 1993). From the Lakota, he learned their theories and practices on personality, identity development, and child development, and nurturance. In doing so, he noted what was obvious to most Indigenous peoples, i.e., culture and external factors shape behavior for adolescents. Afterwards Erikson used their teachings to make critical links and inform his developmental theories, especially around adolescence. Though the word “adolescence” appeared in the 15th century and came from the Latin word “adolescere,” which meant “to grow up or to grow into maturity” (Lerner and Steinberg, 2009, p. 1), it wasn’t until 1904 that the first president of the American Psychological Association, G. Stanley Hall, was credited with “discovering” adolescence (Henig, 2010, p. 4). Meanwhile, Indigenous cultures have long held the notion of adolescence, as we understand it today. Prearrival of European settlers, Indigenous pre-adulthood and exploration was well practiced within Indigenous communities. For instance among Choctaws, it is common knowledge that the ancestors did not promote marrying a young adolescent child nor having children until the age of 20 years or more. Yet at the same time, tribes supported healthy sexual development and as early as the 1700s, Europeans documented American Indians having invented and widely used an oral contraception effectively for birth control. This was 200 years before western science was to create the birth control pill (Keoke and Porterfield, 2009), thus demonstrating complex biological and pharmaceutical knowledges. Ironically, Margaret Sanger who developed the birth control pill for western medicine was also a large proponent of eugenics and forced sterilization (Franks, 2005). Though Erikson recognized Indigenous people’s influences on his work, racist notions of inferiority prevented the recognition of Indigenous knowledges as theories, and as intellectuals who could have readily co-authored. However, Indigenous academics, have been trained in western education and earning doctorate degrees for more than a century. For instance, the first Indigenous lawyer, and Indigenous rights proponent, was Choctaw tribal member, James McDonald, who graduated from Georgetown Law School in 1831 (Hoxie, 2013). Furthermore since the 1900s to 1930s, through the Society of American Indians, over 230 American Indian intellectuals, professors, and doctors were organized, actively met at conferences, and were indigenizing academic theories. They influenced US policies for Indigenous rights and impacted laws affecting Indigenous peoples (Allen, 2013). Meanwhile, many in western psychology were still calling Indigenous peoples “primitive” and claiming that they had “inferior” intellect.

Similarly esteemed Carl Jung developed the field of analytic psychology as guided from Indigenous knowledge and theories. However, he differed from Maslow in that he readily discussed the influence of tribal knowledge upon his work; albeit, through a paternalistic and ethnocentric lens. Indigenous scientists have argued that Jung objectified and romanticized Indigenous peoples using a colonial gaze that skewed his interpretations (see Durie, 1994; Deloria, 2009). This can be seen in Jung’s writing “it is not only primitive man whose psychology is archaic. It is the psychology also of modern civilized man. ... every civilized human being, however high his conscious development, is still an archaic man at the deeper levels of his psyche” (Jung, 1964, pp. 50–51). Jung further recognized that while “whites believe that they thought with her head, every one of the Pueblo knew that thinking comes from the heart” pp. 247–248. Unfortunately, Jung did not cite the Indigenous knowledge keepers from whom he learned as co-authors; instead, he simply integrated their intellectual property into his work as his own. Furthermore, he was often seen to twist Indigenous intellectual theories presenting them through his colonial lens. For instance, “In evoking the figures of the devil and the divine, Jung interpreted the trickster figure in comparative terms that made sense to European psychologists and scholars, but which had little to do with American Indians” (Deloria, 2009). A strong Indigenous co-author and intellectual could have readily assisted Jung in writing a unified and accurate view of Indigenous analytical psychology, which could have moved the field forward even more. One Indigenous co-author could have been the highly esteemed, Dr. Marigold Linton, who graduated with a PhD in Psychology in 1964 and was the first doctorate level American Indian psychologist (Trimble and Clearing-Sky, 2009). Despite many other Indigenous intellectuals with doctorate degrees, missed opportunities for advancing the field of western psychology were likely marred by racist and ethnocentric notions that did not respectfully recognize and integrate Indigenous intellectualism.

Plastic medicine wheel

-When the hen nurtures and raises the egg as her own, even her offspring doth not protest its intrusion- author’s Choctaw Family proverb

As aforementioned, non-Indigenous western scholars/researchers have taken Indigenous concepts, repackaged them within their western framework and then applied them to healing. Indigenous psychology has also been infiltrated by western concepts, which

are not properly cited or recognized as noted in the above Choctaw family proverb. One of the most prominent is the colonial view of the “medicine wheel” as related to behavioral health, which continues to plague Indigenous psychology. A brief online search will yield many papers by Indigenous, and non Indigenous allied academics, who write about “decolonizing” and using “indigenist/Indigenous research methods;” yet, they still utilize the compartmentalized westernized “medicine wheel” to guide their health interventions. This remains highly problematic for several reasons.

First, the *medicine wheel* term was created using a colonial settler gaze upon an authentically sacred symbol, which is shared across Turtle Island, or North America. The mere terminology has been argued as a form of cultural appropriation and misuse (Robertson, 2021). At the turn of the century, several white settlers set their eyes upon the Bighorn Wheel in Sheridan Wyoming and decided to term this symbol a “medicine wheel”, based on the circular symbol with four segments having a circle in the middle. These stones and shapes obviously depicted a distinctly sacred site. However, by asserting power and dominion over Indigenous symbolism, white settlers began to identify and categorize the naming of all similarly shaped icons both on ground and in drawings, as the “medicine wheel” (Brumley, 1988, 2006; Eddy, 1977; Kehoe and Thomas, 1979). Additionally, many tribes utilized similar iconography as found within carvings, writings, etc. For example the first author’s Choctaw culture utilizes a circular symbol, sometimes with a central ring, that often refers to our sacred fire and simultaneous connection to multiple worlds (Johnson-Jennings et al., 2022). In essence, the medicine wheel was named by settlers as “medicine,” but doing so reduces the fluidity and sacredness of the symbol to be about healing alone. From an Indigenous view, naming is ceremony, and for this object, settlers have done the naming, a “wheel.” Given one western definition of a wheel *being to publicly produce someone or something and use them to help you achieve something* (Merriam-Webster, 2004), settlers viewed these symbols as assisting humans alone, reflecting the colonial view of ownership and taking. Whereas Indigenous frameworks often view healing as bidirectional with the land/rocks/sky being active participants and kin in the healing process-rather than mere objects (Johnson-Jennings et al., 2020, 2022). Thus, this naming has eroded the original meaning behind these sacred sites and symbols. For some, this symbol is known to represent the sacred directions, movements of the cosmos, and align with star constellations (Robertson, 2021). However, over time the colonial lens and promotion of the medicine wheel has overridden the actual ancestral use of these symbols and sacred sites.

Secondly, the medicine wheel has been appropriated by settlers and then infiltrated western medicine and psychology to day. Like a cancer, it has proliferated and taken over. Beginning in the 20th century, the medicine wheel was invented as a potential health tool for American Indians, as created by what some may call a *plastic*, or fake, white settler, medicine man. In 1972 Charles/Arthur Storm, or as he called himself *Hyemeyohsts*, a reportedly invented name, falsely claimed to be a Cheyenne tribal member, even forging a tribal enrollment card, which was later exposed by the tribe (Velie and Mclinton-Temple, 2007). Storm then published what he called “Cheyenne” knowledges with the medicine wheel as a teaching tool for wellness. In doing so, he researched some elements of Indigenous healing and proceeded to insert yellow, black, white, red, and blue/black colors on his wheel, as well as assign animals and personality traits. He then devised the separation of “mind, body, spirit, emotions” for non-Natives. However, dissection of the self as separate mind, body, spirit and emotions has not been found in Indigenous traditional views pre 21st century (Robertson, 2021). In fact, Robertson (2021) argues that no tribal language in Canada and, to the authors’ knowledge, no tribes in the US have a word for *mental health* (i.e., referring to the health of the *mind* as distinct and separate from emotions). Hence, using this medicine wheel symbol to refer to the individual and separation of self into four quadrants are colonial constructs (Robertson, 2021). To make this model passible, Storm integrated concepts of balance and relationships that he appropriated from Indigenous culture. His cunning cultivation of the plastic medicine wheel took root, not only within new age movements that he said to have led, but clandestinely in our Indigenous communities and among Indigenous practitioners and non-Indigenous alike. Subsequently, Indigenous psychology began to emphasize the individual as self, fractured and guiding treatment with a facade of medicine wheel culture.

Third, today the medicine wheel continues to be used in psychological training, education, and practice, which unduly fragments our healing approaches and could cause harm. Some have argued that the medicine wheel remains a “mirage” that arbitrarily tries to present complex Indigenous ways of knowing into four quadrants through a colonial lens for practice or education (Widdowson and Howard, 2013). As Indigenous psychologists and educators, we must ask ourselves if what we practice actually aligns with Indigenous ancestral teachings and instruction, or if it has been filtered through a colonial lens to be palatable but not necessarily effective. One can then begin questioning if a treatment is incongruent with the community’s, family’s or individual’s ancestral teachings. One common incongruity is the western colonial framing of the medicine wheel tending to the *mind*, or as often referred to cognition, as separate from *emotions*. If utilizing this wheel and compartmentalized view of health, many Indigenous health interventions may not be as successful in addressing cultural health beliefs around wellness and balance, as they see the body as whole and inseparable. Believing its worth as an Indigenous tool, numerous Indigenous researchers base their research or health interventions upon this fractured model. However, they are often the offspring of those academic elders who have accepted this plastic medicine wheel as part of Indigenous culture. Many Indigenous psychologists may not know the medicine wheel’s history and, or feel pressure to follow precedent set by mentors who used this colonial symbol of self. Yet, Robertson (2021) argues not only does the medicine wheel do a disservice for Indigenous clients, often perpetuated by those who practice Indigenous psychology, but it limits culturally appropriate, holistic healing that could occur.

Overall the medicine wheel encourages viewing a dissolution of self, void of context. To teach this to a client or patient or student can be argued to further western colonial notions in psychological practice. This fragmentation of the person void of context can encourage ignoring the role of ignore their maltreatment; i.e., genocide, historical trauma, present trauma, and ongoing oppression on their current symptoms today. Instead of seeing self as intertwined and an interconnected whole within an intergenerational

environment, the Indigenous person and their actions are highlighted and blamed, either directly or indirectly. Though the *medicine wheel* symbol has been argued to affect one's emotion and communicate information (Ortner, 1979: 92), this conceptualization, nonetheless, could promote the blaming of the individual for not tending to their "distinct" four quadrants effectively to maintain balance and wellbeing. Hence, Indigenous psychologists, researchers, educators alike must carefully consider decolonizing the medicine wheel and practices attributed to such.

Weaving thriving: indigenous psychology

The majority of Indigenous persons are healthy and well. Yet, the vast systematic attempts at genocide, ethnocide, and assimilation have shattered Indigenous wellbeing, which reverberates throughout each generation. Indigenous people's ancestral/intergenerational connections, languages, family systems, original instructions and ceremonies have not been *lost*, they have been systematically *stolen* in an attempt to eradicate, subjugate, and dominate, as scholar Dr. Leonie Pihama has noted about Maori culture (Pihama, 2012). Beginning in the late 1400s to present day, Indigenous peoples in the Americas had their pillars of wellbeing stolen. This has spurred vast and ongoing health disparities with Indigenous peoples. For instance in the US, Indigenous peoples experience mortality rates higher than all US rates combined; including 3 times the diabetes rates and 4.6 times the rate of chronic liver diseases (mainly due to fatty liver diseases as related to obesity) (IHS, 2019). These disparities cannot be noted outside of the present day colonial settler context, which has nurtured and maintained this oppression (Czyzewski, 2011). Colonialism and ongoing structural racism continue to influence Indigenous persons lives in ways in which scientists are just beginning to understand. For instance, chronic pain rates increase for Indigenous persons who experience historical trauma, early childhood trauma, and racism (Chae and Walters, 2009), and Indigenous persons experience the highest rates of pain as compared to other racial ethnic groups (Johnson-Jennings et al., 2020). These high pains rates, coupled with racial discrimination and trauma, can also increase risks for smoking, which then increases perception of pain (Johnson-Jennings et al., 2014). Pain can become a vicious cycle and if untreated can result in individuals using substances to cope (Johnson-Jennings et al., 2020). In addition, more than 80% of Indigenous persons in the US have experienced violence, with over 90% of cases being non-Indigenous perpetrators (Department of justice, 2016). They are also more likely to be killed by the police, experiencing the highest rate (i.e., 2.9) as compared to Blacks (i.e., 2.6), Hispanic/Latinos (i.e., 1.7) and Whites (i.e., 0.9) (Hansen, 2017). This ongoing violence continues to feed mental health disparities in Indigenous communities today (Warne and Lajimodiere, 2015); however, most psychological interventions focus on the self as opposed to the structural system causing harm. Practitioners, educators, and scientists alike must consider the individual and their ability to cope and draw from resources within these colonial environments. In fact, Indigenous communities have, or are revitalizing, their traditional medicines, their kinship supports, their original instructions from their ancestors, etc. in order to promote resilience and wellness. And, Indigenous peoples are doing more than surviving, they are continuing to reclaim and thrive using their health approaches. Some describe this as *thriving*, which refers to drawing from the ancestor's (i.e., their ancestral knowledge and practices) while focusing on living in a good way for the future ancestors (Johnson-Jennings et al., 2020; Billiot et al., 2020). This thriving is seen in the many community engaged and grassroots projects that emanated during COVID (e.g., Jennings, 2020; Tuason et al., 2021).

Today Indigenous populations are continually revitalizing and reinventing Indigenous approaches to healing. They are strong and carrying forward their cultural beliefs and teachings for the next generations. They are influencing psychological education, practice, and building healing from the grassroots level. For instance, Canada's educational system is indigenizing as mandated by their psychological association. The Canadian Psychological Association's did so as a response to the Truth and Reconciliation Committee report asserts that all "undergraduate psychology students should have access to a course on Indigenous cultural literacy" that covers (a) an introduction to Indigenous knowledge and worldviews (b) the impacts of Canada's colonial policies (e.g., the Indian Act, Residential Schools, the Sixties Scoop, intergenerational trauma), on Indigenous peoples and communities, and (c) Indigenous psychology and cultural allyship" (Schmidt, 2019). However, while considering decolonizing, one may ask why western European based, settler psychology is termed "psychology", and practices related to Indigenous culture be considered "Indigenous psychology." This reference point normalizes western settler psychology as the baseline. However, Indigenous knowledges and health practices continue to be quite effective not only for Indigenous peoples, but as seen through western psychology's cultural appropriation of Indigenous healing ceremonies around psychedelics for non-Indigenous persons too (Gukasyan and Nayak, 2021). However, Indigenous scholars and knowledge keepers should be guiding these efforts, as they maintain ownership of their intellectual property.

Furthermore, Indigenous psychology has promoted psychological practices based on Indigenous culture as opposed to the eugenic-based, western psychology. Though this does prove difficult given the vast cultural differences that exist between tribes, commonly held beliefs that are emic, or shared. Though *Indigenous psychology* could simply be referred to as *Indigenous healing*, Indigenous psychologist scholars Dr. Mason Durie (see Durie, 1994), Dr. Teresa LaFromboise (see LaFromboise and Lewis, 2008) and Indigenous psychology philosophers such as Vine Deloria (Deloria, 2009), only to name a few, have paved the way for developing an Indigenous psychology field of practice and research that is decolonial. The authors working definition for *Indigenous psychology*—as distinct from western psychology, includes the following: (1) consideration of historical and present day traumas on Indigenous health and coping with a collective self vs. an individual. (2) including the study, pursuit, and practice of Indigenous healing, which is emically holistic and complex and wise. (3) viewing healing as interconnecting self with human and non-human kin and through multi-temporal (past, present, and future) and spatial dimensions of health, as guided by ancestral direction. Indigenous healing

practices have not ceased. They have continued across the millennia. Indigenous ancestors have been excellent scientists and researchers who intelligently drew from the spiritual world to guide their research, study, and practice. Presently, Indigenous academics, leaders, elders, and intellectuals continue to guide these initiatives to refine Indigenous psychology.

Through Indigenous psychology, western psychology's colonial history, narratives, and biases can be exposed and addressed to effectively serve Indigenous populations who are in need. At the same time, further space for Indigenous psychology must be created and maintained. Hence, a decolonial framework for western psychology is needed. As our academic elder, Professor Linda Tuhiwai Smith notes, "Decolonizing Methodologies is not a method for revolution in a political sense but provokes some revolutionary thinking about the roles that knowledge, knowledge production, knowledge hierarchies and knowledge institutions play in decolonization and social transformation" (Smith, 2021). Indigenous psychology is an ever-growing field that if led by Indigenous peoples can have vast impacts on improving health. There also exists a need for future research to determine how Indigenous healing methods could inform individual and group treatment for Indigenous peoples in innovative ways. This may include Indigenous practitioners, educators, and scientists appropriating some western psychology tools for our own use, on our own terms. Our ancestors have often done this since European invasion, with beadwork being a prime example. If grounded within Indigenous ways of knowing and science, Indigenous psychology can adapt and integrate as needed.

Finally, Indigenous communities are engaging in a plethora of strength's based research to build their health and wellbeing. Some are grounding their work in Indigenous healing paradigms of land and culture and are conducting land-based healing to improve health and prevent chronic diseases (e.g., Jennings, 2020; Johnson-Jennings et al., 2020, 2022; Redvers, 2020; Walters et al., 2020). They then augment their approaches with western psychology as appropriate. For instance, Johnson-Jennings has founded her research and approach in an Indigenous cultural framework and then weaves in her narrative therapy training as appropriate. For instance, through her blending, she has co-developed land-based narrative reactive therapy, which focuses on physically visiting land sites for historical trauma and re-narrating these as focused on the strength, resilience, and love of those ancestors who experienced such (Johnson-Jennings et al., 2022). However, the individual is not the only focus of this health intervention approach. The land is viewed as an active participant who is also healed through reconnection and ceremony (Johnson-Jennings et al., 2020). Still, other Indigenous communities are engaged in returning to traditional foods and practices and involving the entire community in feasts, activities, social dances as a method to restore mental health and healing (Johnson-Jennings et al., 2021). The communities are often utilizing their Indigenous healing frameworks and tending to the whole person, the community, and their environment, further spurring thriving. During COVID-19, Indigenous communities quickly rose to the challenge of maintaining wellness and developed much community activism and support (e.g., Akuhata-Huntington et al., 2020; Bratina, 2017; Tuason et al., 2021). Indigenous persons are no longer merely surviving, but are active leaders and intellectuals who are now in a state of promoting thriving.

Conclusion

Humankind has not woven the web of life. We are but one thread within it. Whatever we do to the web, we do to ourselves. All things are bound together. All things connect.

Chief Seattle, Duwamish.

This chapter is by no means exhaustive or a complete decolonial take on western psychology. It is however, one initial step in exposing the subjugation of Indigenous knowledges and intellectual property. It further has attempted to shed some light on the advances that Indigenous knowledges have gifted to western psychology. At the same time, this chapter has proposed to illuminate how colonial views of health can be masked within Indigenous cultures, such as the medicine wheel, and how this may influence treatment outcomes. Hence, a need exists for more Indigenous psychologists and allies who can guide western psychology in creating space for Indigenous psychological training, education, and practice.

Introduction

Indigenous weaving practices, and the storied artforms they produce, hold sophisticated systems of knowledge that guide how we move through and relate to the world, how we learn and are taught, how we experience life and pass down knowledge intergenerationally. Historically, these weaving practices were practical and purposeful - such as the knowledge required to weave clothing and create shelter. More recently, Māori (the Indigenous people of Aotearoa New Zealand) and other Indigenous researchers have looked to theorize our artistic practices as research methodology to tell our stories and explain our lived experiences in our words, on our terms, and through our own Indigenous artistic lens.

Methodology as an element of research, is an immutable aspect of academic scholarship. It refers to the concepts and theories that frame the way research is conducted, that is, the knowledges and influences that underpin research as a process for creating “new” knowledge. Over the last forty years, Indigenous research methodologies within academia have taken up critical Indigenous theories (Chilisa, 2012; Kovach, 2005, 2009; Smith, 1999) that seek to re-claim, re-frame and re-present the lived realities of Indigenous peoples. Rather than accept a Western academic definition of methodology, this chapter enthusiastically takes up threads woven by other Indigenous researchers that encourage us to look to our own “ways of being” in the world, re-weaving our thinking to theorize education research methodologies that will serve us in our diverse lived realities. By re-claiming methodology as an aspect of being Indigenous that has, for centuries, served our people and allowed them to flourish, I consciously seek to re-frame how methodology is viewed both within academic research paradigms and beyond.

While the approach I forward here is grounded in Kaupapa Māori (Māori centric) theory (Pihama, 2001; Smith, 1997, 2003), this chapter reaches beyond an Aotearoa New Zealand context to connect with other Indigenous decolonizing approaches. By weaving together our different and similar threads of theory and practice we simultaneously contribute to both our local decolonizing agenda and broader global Indigenous aspirations for self-determination. Like other Indigenous scholars I lean away from a convenient “pan-indigenous one size fits” approach to thinking about methodology, instead leaping in to research approaches which are critical, culturally based, decolonizing Indigenous approaches to research such as Kaupapa Māori research that is by Māori, for Māori with our language, values and aspirations at its center.

Kaupapa Māori theory emerged in the 1990’s as a radical response from Māori academics to create space in the academy for Māori-centric research methodologies to emerge (Henry and Pene, 2001; Irwin, 1994; Lee, 2008; Nepe, 1991; Pihama, 2001; Smith, 2003; Smith, 1999) or what Pihama (2001) calls “culturally defined theoretical space” (p. 77). Another prominent Māori academic, Kathy Irwin says that Kaupapa Māori research is that which is:

[C]ulturally safe, that involves the mentorship of kaumātua, that is culturally relevant and appropriate while satisfying the rigours of research, and that is undertaken by a Māori researcher, not a researcher who happens to be Māori.

(Irwin, 1994, p. 225).

Irwin’s description of Kaupapa Māori research, while written over twenty years ago remains relevant today, as Māori continue to claim theoretical space that centers our ways of being and doing in academic research.

This chapter is in two parts. The first part sets out to re-weave thinking about research methodology and how it shapes and informs education research. By reclaiming methodology from the academy as an exclusively academic activity, and re-framing it as an inherently Indigenous practice of enquiry, we reinstate ourselves as Indigenous methodologists, theorists and experts on ourselves and, as such, the people best placed to research “us”. When we claim space to theorize Indigenous ways of being and doing as methodology, particularly Indigenous arts-based methodology, I argue that we enact a decolonizing praxis of thinking and doing (Kovach, 2021), theory and practice, that holds within its strands a transforming potential to create positive change for Indigenous people. Practicing art is enjoyable. Theorizing arts practice is interesting – but when the theory is practiced, and the practice is theorized, a powerful praxis is potentialized that elevates “craft” and the artifacts it produces to robust and valid theoretical praxis.

The second part of this chapter offers an example of how an “old” set of arts practices was theorized as a “new” arts methodology. I share an approach I developed in a Kaupapa Māori research project about eight Māori women and the aspirations they hold for their children and grandchildren to live “culturally whole” lives as Māori, expressed through the storied heirloom cloaks they wove for their families.

Overall, this chapter has two simple yet complex aims. The first is to encourage Indigenous education researchers, particularly those in arts-based education, to look to their own practices and deeply methodological ways of being and doing to theorize methodology. The second is to celebrate the Indigenous theorists that walk amongst us and to draw on their ways of being and doing in the world to theorize the research praxis and methodologies best capable of researching our lived realities from our perspective. Finally, I share the lessons I learnt from re-thinking weaving as methodology and encourage other Indigenous creative artists, scholars, researchers and teachers to contribute culturally located ways of approaching research in education. To ensure the weaving of this narrative begins correctly, I claim a positionality to this topic by introducing myself.

Revealing my threads – who I am comes before what I do

An important, and indeed expected, element of Indigenous research is to locate oneself in relationship to people, place and purpose. In Aotearoa New Zealand, often the first question asked in a Māori language exchange is not WHO are you or WHAT do you do but more importantly WHERE are you from. The response identifies one's relationship to significant geographical landmarks, eponymous ancestors and tribal canoes that connect the person to the land and its people. A right to claim this cultural relationship accrues an immediate and almost greater cultural responsibility to act in “right” ways that seek to honor those people, places and stories.

In contrast, some Western research approaches forward researchers as objectively detached observers to the people, places and stories they encounter. Botswanan Indigenous scholar Bagele Chilisa (2012) argues that some Western research approaches stubbornly refuse to interrogate the impact of researcher positionality, instead championing an acultural objectivity as better capable of generating valid and robust research “results”. Hawaiian scholar Kū Kahakalau (2019) says the expectation of Hawaiian researchers to “remain neutral and unbiased, removing his/her personal opinion from the research process” (p. 13) is incomprehensible (p. 13) given that Hawaiians bring with their mana, encompassing strengths that are simultaneously physical and emotional, intellectual and spiritual, including skills, knowledge, experiences and aspirations. I argue that researcher positionality, their intentions, and the theoretical underpinnings of the research is as important, if not more, as articulating the methods, data collection tools, analysis and conclusions. As such, I locate my reflexive positionality (Kovach, 2021) here as a Māori woman, mother, and daughter, artist and researcher, storyteller and teacher, to declare, as I disclose (Grierson, 2007), the woven stories and experiences through which I view research.

I am the daughter of a Māori mother who, in the context of 1970's feminism and cultural renaissance, sought to reclaim and restore a positive Māori identity in and for her family – ways of being that had been systematically stripped away by a colonizing education system intent on cultural assimilation (Hohepa et al, 1996; Webber, 2008). My mother's deliberate actions to reclaim language, identity and artistic practices in, and for, her immediate family, served to disrupt our family's experience of cultural disconnection so that her children, and now her grandchildren, may experience a positive cultural identity as Māori.

As a child, I reveled in the creative act of making. Whether it was sewing, cooking, or crafting, I recall a deep sense of fulfilment in creating something “new” from something “old”. Scraps of fabric were given new life as blankets or clothing. Cardboard was decorated and fashioned into tissue box covers and match sticks were glued, sanded and varnished to make lighter holders (as abhorrent as it sounds, it was the 1980's). The meditative space of making was where I could sit with my thoughts and upon completion, I experienced an immense joy in gifting what I had made to others – what we name in Māori language as koha.

As a teenager I learnt raranga (the Māori art of weaving harakeke or flax leaves), an art form I picked up very quickly. Weaving was the space where my creativity and desire to make, gift and connect to others, could be located within Māori practices, language, and knowledge. Through raranga I felt connected to an old set of knowledge and practices that enabled me to express my Māori identity in storied and creative ways. I wove backpacks and bags that were gifted to family and friends. I wove mats that were given to a local school and flower arrangements for a relations wedding. At one point in time my ability to weave enabled me to pay my bills and buy food.

After more than two decades developing my weaving and teaching practice, I undertook a PhD that explored the practice of whatu (a traditional cloak weaving technique) beyond its tangible arts practice, to include a theorization of whatu as methodology (Smith, 2017). I named this methodology Whatuora and introduce it in the second part of this chapter as an example of how re-weaving thinking “about” methodology led to re-thinking weaving “as” methodology. First though, let's begin unpicking then re-weaving some theoretical threads.

Part one: re-weaving thinking about methodology

This part of the chapter begins by re-complexifying notions of methodology within the context of arts-based practice, discussing the possibilities created when we find the space, and the courage, to re-weave our thinking about methodology and theory. I introduce you to a key theoretician in my research – my then five-year-old daughter Kahukura - who, through her sharp, bi-literate insight, provided me with a moment of theoretical clarity that led me to developing Whatuora as a Māori arts-based methodology. By sharing Kahukura's story, I encourage Māori and Indigenous researchers to reinstate ourselves as Indigenous methodologists and theorists whilst reclaiming knowledge fragmented through colonization to effect positive change for our communities. By re-weaving how we think about methodology and theory, we honor the embedded and embodied ways of knowing contained within a wide range of Indigenous language, knowledge and narratives as an active and radical form of Indigenous scholarly resistance.

We have always been theorists

Māori, and Indigenous people globally, have always engaged in research, testing methods and methodologies to solve problems, advance technologies and develop theory. Activated by decolonizing politics, re-weaving how we think about research methodology in education seeks to re-claim and re-complexify methodology from its academic constraints to instead “see” methodology through Indigenous eyes and within our creative Indigenous hands. I argue that theorization and methodology does not reside exclusively in academic literature or with distant, sometimes dead, frequently male and often Western theoreticians. As Kaupapa Māori scholar Leonie Pihama (2001) reminds us, theory and methodology did not arrive with the coloniser. Rather, Indigenous peoples have for centuries engaged in their own forms of methodological research to test theories and advance thinking:

As Māori we have a history of investigation. It is an ancient history of exploration, of navigation, not solely in the physical domain, but in ways that reach throughout the many dimensions of Te Ao Māori. These are all forms of research, they are all ways within which our people have developed knowledge and have located ourselves in the wider world. (p. 47)

Indigenous people have always been theoretical, developing our own methodologies and methods to tackle problems. As Hawaiian academic Lisa Kahaleole Hall (2019) says however, that our rich theorisations have been “overshadowed at best, or delegitimized at worst” (p. 111) by dominant Western thought. Indigenous sets of knowledge have for centuries supported great advances enabling Indigenous communities around the world to explore, adapt and advance our technologies (Chillisa, 2012; Hau'ofa, 2008; Kovach, 2009; Pihama, 2001; Smith, 1999). Yet the notion of methodology in our more recent history has been captured and claimed by the academy nudging our ancient ways of research to the academic margins.

Indigenous methodologies have evolved to fit a contemporary reality shaped by the struggle to resist the assault of colonization through projects of cultural reclamation. Eminent Māori scholar Linda Tuhiwai Smith's seminal work *Decolonizing Methodologies* (1999) for example, strongly advocates for reframing and reclaiming methodologies as a critical element of a strategic Indigenous research agenda. Smith discusses the tides or states of survival, recovery, development and self-determination that intersect with those of decolonization, healing, transformation and mobilization, none of which are linear nor are they goals or ends in themselves. Instead they are “processes which connect, inform and clarify the tensions between the local, the regional and the global ... processes which can be incorporated into practices and methodologies” (p. 116). Similarly, Indigenous educationalist and academic Leah Abayao (2006) discusses Indigenous methodology as that which is:

[A]cquired over generations by communities as they interact with the environment ... exploring indigenous technological knowledge and knowledge transmission systems, and recasting the potentialities they represent. (2006, p. 180)

Consider for example the sophisticated navigational systems developed by Pacific voyagers that enabled them to criss-cross the Pacific Ocean on deliberate and purposeful voyages - technologies later regarded as superior to those of the Western world at the time (Evans, 2015). Navigational methods and methodologies such as these required high-level theorization, research, development and testing in order for return voyages across vast expanses of ocean to succeed. Importantly here I argue that methodology is a lived experience, a praxis if you will, of weaving together the theory and practice, the thinking and doing, to create solutions.

Claiming space to theorize art practice as methodology

Theorizing is not new to us. Indigenous methodologies that enable us to think about and understand our lived experiences have existed in various forms for thousands of years. Margaret Kovach (2009), a Professor in Education of Plains Cree and Saulteaux ancestry explains Indigenous methodologies as ways of knowing that are both practical and capable of transmitting values and

knowledge. In the Aotearoa New Zealand context, Māori across a wide range of fields are working to awaken “new” knowledge from “old” knowledge by theorizing mātauranga Māori or Māori knowledge in new and useful ways.

Māori arts researchers, Donna Campbell (2019) and Kahutoi Te Kanawa (2008), both recognized internationally as experts in traditional Māori fiber arts, theorize the traditional Māori weaving practices of tāniko and rāranga as research methodology. Campbell and Te Kanawa’s in-depth practical expertise in their respective fields, bound together with their theoretical scholarship in teaching and research, sees a re-weaving of “old” know how with innovative “new” ideas grounded in an active Māori political consciousness.

Yet we do not theorize for theory’s sake. As Māori arts practitioner, Charles Royal (2011), says the goal of theorization is not to create new knowledge for its own sake but rather “to develop a way of encountering the world that upholds life, deepens our relationships with the natural world and with each other (p. 48). Similarly, Hawaiian scholar Ho‘manawanui says that Indigenous researchers are rediscovering, recognizing and utilizing long standing ancestral analytical and intellectual tools (Ho‘omanawanui, 2019) drawing from the past before us (Wilson-Hokowhitu and Meyer, 2019), weaving it with the to find solutions to our problem.

When theorizing the artistic practice of whatu as the methodology most appropriate for my research, I did not invent something “new” as is often the imperative in research from a Western perspective. Instead I gathered existing strands of thinking around, language and identity, weaving them together in such a way as to create “new” fabric from “old” threads or “new” theory from “old” ideas. While Western theory can be a useful theoretical ally and, like critical and emancipatory theory, has contributed to Māori and Indigenous scholarly thinking, astute theoreticians walk both physically and spiritually amongst our own people - if we only have the eyes to see and the hearts to hear.

Our theoreticians walk amongst us

When I began my research, there was not an established methodology that immediately appeared to me as appropriate for a project that explored living as Māori women and weaving cloaks. I noted that some research projects explain methodology in a small section within a chapter where “established” methodological approaches are assumed then “applied” to the project. Whatuora methodology is a more diffuse, interwoven idea. Theorizing the artistic practice of whatu as methodology is concerned with creating methodology, and in turn methods, from within the embodied knowledge of whatu as an arts practice. When theorizing whatu as the methodology most appropriate for my research, I did not invent something “new.” Instead, I wove together several existing sets of ideas around Māori weaving practices, language, identity in a “new” way – in a sense creating “new” fabric from “old” threads.

While holding firm to the belief that the methodology for my research would be found within its practice, it was a gift from a key theoretician in my family – my then five- year-old daughter, who prompted me to theorize the practice of whatu beyond its practical application. I began to think about the interwoven meanings embodied in the complex term whatu – something my bi-literate daughter Kahukura did instinctively - and how these interwoven meanings could be bound together as methodology. This story was written several years ago about this moment, I share with you Kahukura’s story.

I sit deep in thought, working on a kākahu (cloak). Fingers moving rhythmically. Aho (weft strands) tangling and untangling. Whenu (warp strands) coming together. Building the kākahu whenu by whenu, one by one as the feathers are added. Some in pattern some not. Some selected, others discarded. I am in the zone. Thinking, thinking. Thinking about my research. Thinking about who this kākahu is for. Thinking about what to cook for dinner.

Thinking that it is getting dark and the girls need to come inside. Thinking and weaving. Kahukura is 5 years old. She often sits beside me and does her version of “whatu” – twisting and plaiting and twirling of whenu into curious knots. I think to myself, “I love it when she sits here with me,” and I tell her so. She smiles and I can tell that she enjoys the time we sit together. I think to myself, “I wish I had had someone to sit next to, to learn whatu. Yet, I do not “teach” Kahukura to whatu. She watches. She talks. She sings. The pedagogy at work here is not teaching. It is education. It is the deliberate act of whatu pedagogy – reclaiming knowledge and learning and passing this on to our children. My aspirations, handed down to her through the time we spend together, talking, telling stories, weaving. I am cloaking her in my aspirations that, in turn, she will continue these traditions with her daughters, my future mokopuna.

She comes in from outside and asks me in Māori language “Kei te aha koe Māmā? [what are you doing mum?] E whatu ana ahau bubba.” [I am weaving.] “Oh,” she says, hums to herself, plays with the whenu and then replies. “Whatu eh Mama is the same as seeing, like with these eyes (she points to her eyes) and your other eyes (she points to her heart)? I look up.

She smiles and walks away. I stare after her as a connection is made, blinding me like a bolt of lightning. Whatu means finger twining. Whatu also means eyes, to see or a way of seeing both the physical world and through your emotional soul. In this moment Kahukura helped me to “see” that the physical practice of whatu is simultaneously a way of being and being seen in the world through the stories we weave into its fabric. I watch her go and thank the universe for the simple yet complex brain of a 5-year-old and wish I could think with her clarity more often.

(Smith, 2017, p. 92).

Kahukura's (in)sight reminded me of the richness that exists within our own language and knowledge systems. Sometimes it takes a different "lens", with which to view that knowledge and weave it together in new ways. As Māori scholar Taina Pohatu (2011) says,

...an unwillingness to properly value the potential held within Māori bodies of knowledge, deposited by generations past into the "library of te reo" [language], will have the effect of limiting our visions, horizons, and so expectations (p. 3).

Kahukura's story is an example of what Kovach might name as abductive knowledge, that is a moment of creative insight that grabs your attention, an "a-ha moment" or a "flash of knowing" (Kovach, 2021, p. 34). Abduction weaves together observation, instinct and experience offering an "inclusive, holistic consideration of knowledge" (p. 35) in an effort to establish an hypothesis (Kovach, 2021) and aligns with an Indigenous approach to theorization. Kahukura's ability to re-think weaving, its language and practice, offered me a way to re-weave my thinking of whatu, beyond its practical sense, and instead see its potential in new, theoretical and methodological ways.

I am, unsurprisingly, challenged by scholars in naming Kahukura as a theorist, after all she is not published, in fact at the time she was just learning to write. Furthermore, abductive reasoning is labeled problematic in scientific research as intangible and unverifiable. Perhaps by viewing theory such as that which Kahukura imparted as only accessible to those equipped with the creative eyes to see and ears to hear, such theory can be elevated from hearsay and anecdote. I hold firmly to the notion that knowledge, wisdom and knowing comes from many forms, animate and inanimate, human and non-human. As Indigenous people we understand that there is story in the wind and wisdom in our mountains. It is not enough, however, to simply hear or receive a story and name it theory.

Kahukura's story could have appeared as an anecdote or cute vignette within the research. Instead, I chose to position her contribution as containing important theoretical knowledge and thus it was appropriate to acknowledge her as a key contributor to developing Whatuora methodology. Having been handed the theoretical threads of an idea through Kahukura's insight, I took up these threads, weaving and synthesizing literature from a wide range of Māori, Indigenous and Western thought in order to forward whatu as a theorized research methodology most capable of underpinning my research *Whatuora: Whatu Kākahu and Living as Māori Women*. Having foregrounded here the theoretical space that supports how Indigenous scholars can re-weave our thinking about methodology, the following section offers Whatuora as an example of theorizing an Indigenous arts practice as methodology.

Part two: re-thinking weaving – theorizing an arts-based methodology

Māori and Indigenous artists maintain an ancestral legacy of innovation and creativity (Lander, 2011), holding firmly to "old" cultural traditions and arts practices and weaving those threads in "new" contemporary ways. It is this innovative creativity that I drew upon to re-think the traditional Māori art of cloak weaving as decolonizing methodology. Whatu kākahu or traditionally woven cloaks were once viewed as prized art(efacts) by early colonial collectors' (Roth, 1924) intent on cataloging the "exotic South Seas" for European consumption (Te Rito, 2006). Within a short time however, what were once priceless storied treasures, became viewed as impractical "clothing" and labour-intensive women's "craft" drawing whatu kākahu as an embodied art form and creative practice to the brink of extinction (Tamarapa, 2011; Te Kanawa, 2008), as the intergenerational transmission of skill and practice was interrupted (Te Awakotuku, 1993). After many decades of active revitalization, traditional cloak making is once again flourishing as Māori women (and some men) weave storied cloaks for the next generation (Smith, 2017). My scholarly contribution to this legacy of arts innovation and Indigenous methodologies is theorizing the art form of whatu as research methodology.

Whatuora: Whatu kākahu and living as Māori women (Smith, 2017) explored the lived experiences of eight Māori women – including myself as reflexive researcher (Kovach, 2021). Over one year, as I taught the women to weave traditionally made Māori cloaks, they spoke and journaled their storied memories of reclaiming, restor(y)ing and re-visioning what it meant to live holistically well and culturally connected lives as Māori women. The act of weaving together in women's space, of being still and centered, provided a culturally grounded safe space for the women to discuss how their experiences of growing up and "being Māori" now inform the aspirations they have for their children and grandchildren to "live as Māori". To live "as Māori" is an education discourse popularized by renowned Māori scholar Mason Durie (2001) as a way to describe Māori-held aspirations to live well, fulfilled, holistically balanced lives with access to the Māori world including language, culture, community. The women's aspirations to develop for their children, a positive Māori identity, to speak Māori language and connect to the land, its history, people, and arts practices, do not fall out of thin air. Instead, they emerged from the women's, sometimes painful, stories of their own cultural assimilation and the work they actively engaged in to heal from cultural and identity trauma – for themselves and their families.

An idea is awoken

As my practice as a cloak weaver grew, so did my interest in theorizing this knowledge at a deeper level. I began to think about the embodied nature of whatu practice, how it made me feel about myself as a Māori woman and the maternal language associated with the practice. Several years ago, I was asked by a few Māori women friends to teach them what I had learnt about cloak weaving.

As we sat and wove, I noticed similarities in the experiences of the women who attended. We would talk and tell stories, share memories, laugh and sometimes cry as we reflected on knowledge lost and gained, memories of growing up and being Māori, being women, being mothers, grandmothers, aunts and sisters. I could see the transforming and healing power of whatu at work. As well as creating beautiful, tangible garments for their families, the women were weaving together their stories and reflections, creating an intangible fabric to cloak themselves in. Our conversations and my observations of the workshops, intertwined with my interest in education research prompted me think about whatu – both its practice and its theory as an intertwined praxis – as a site to reclaim and self-determine how we understand ourselves living as Māori women.

Introducing Whatuora as methodology

Whatuora, the new term I created to name my methodology, amalgamates two not commonly associated Maori words - whatu and ora. Whatu, the term for traditional Māori finger twining, is an ancient practice developed over centuries and used to create traditional clothing ranging from everyday rough rain capes through to ornately woven and highly prized cloaks adorned with native bird feathers (Tamarapa, 2011). Whatu is also the Māori word for eyes - the lenses through which we view the world, as introduced through Kahukura's story. By bringing these two words together I wanted to embody the intertwined nature of whatu practice by twining two distinct ideas into one "new" concept. It was interesting to note that, as our research progressed, some of the women began to use "Whatuora" to sign off email communications, for example "Whatuora ki a tātou" (may your eyes/vision be well), signaling perhaps that the women had claimed what was essentially a new word as having meaning beyond the constructs of our research.

At its simplest form, the practice of whatu requires the twining together of two sets of aho or horizontal weft threads, around a set of whenu or vertical warp threads as seen in the diagram below. As one set of aho threads come to the fore, it is exchanged for another that is then foregrounded, both sets of aho interacting interdependantly with the other. Consider these two sets of interacting and interlocking threads as theory and practice. One set of threads, for example theory, is interesting on its own but becomes most potent and useful when it interacts with its own set of practices as a transforming praxis and as such builds the "fabric" of an idea line by line.

Interdependant binding threads – whatu aho rua. Line drawing by Tim Galloway, reproduced with permission from the Te Papa Collection: © Te Papa (MA_I.278976).

Ora is a common word in the Māori language that means to be well, to survive, to be healthy, fit and vital (Williams, 1997). The ubiquitous greeting in Aotearoa New Zealand "kia ora" for example literally means "be well". Of particular relevance to a Whatuora methodology is ora as a stative - to be safe, cured, recovered and healed (Williams, 1997). Ora, in the context of the Whatuora research, is understood as a journey to wellness and recovery from the impacts of colonization, for Māori women who are reclaiming, restor(y)ing and self-determining what it means to them to live well lives as Māori women. When the complex notions of whatu as eyes, ways of seeing, ways to be seen, and the practice of finger twining are woven together with notions of ora as being well, cured, healed and able to participate culturally, a new bound together idea - Whatuora - comes into being as a methodology through which Māori women's stories and experiences can be viewed (Smith, 2017, 2019, 2020).

Whatuora as a radical decolonizing methodology

Radical ideas, methodologies and approaches are necessary to decolonize our current education conditions. If "radical" – another politicized word that deserves some re-complexifying attention – means to change from the accepted, to go beyond the norm, or to advocate for fundamental or revolutionary change, then Whatuora is forwarded here as a radical Indigenous methodology. Whatuora methodology seeks to push the boundaries of whatu beyond its established understanding as "eye" or "finger twining" to a theorized approach to research that expounds a way of "seeing" the world through decolonizing eyes.

Whatuora asserts that the ability to "see clearly" or to "see well" requires an active and critical reflection of our past experiences to better understand what and how we view our present and envision our future. Applied to this research, Whatuora is a lens with which to "see" the stories and experiences of Māori women living as Māori. While Whatuora was developed within a particular research project it is not intended to remain in this Māori arts and education space. Like all decolonizing methodologies, drawing on Indigenous thought has the potential to transcend academic fields, educational settings and Indigenous contexts. While the concept emerges from within the Māori practice of whatu, the political decolonizing lens of Whatuora is both fluid and flexible.

Activated by Kaupapa Māori theory, I looked to the knowledge, language and practices of whatu to guide this research and in the process gained some valuable insights about the challenges and rewards of theorizing a "new" Kaupapa Māori methodology.

Whatu as teacher - what I learnt about theorizing Indigenous methodology

I learnt that developing theory from an Indigenous practice-based art is necessarily difficult. To explain and capture the embodied, tactile and tangible relationship between the creative practice of whatu and Māori women in a linear written form is to attempt the impossible. The transformative nature of Whatuora as a research approach occurred in its fullest sense when the wāhine sat and talked, wove and shared stories; when they connected and related to each other as Māori women; presented their completed kākahu and cried; as they described the feeling of seeing it worn by their grandchild. Transforming moments were also experienced in our

own private and quiet spaces when we wove, wrote in our reflective journals and sat with our own thoughts in the quiet solitude that whatu weaving offers. I recognized early on the impossibility of trying to capture the essence of every embodied interaction in a linear and logical written.

I learnt that methodology does not belong solely to the academic realm. Māori and Indigenous people have always engaged in research, employing methods and methodologies to solve problems, advance technologies and test theories. By re-complexifying how methodology has been constructed in an academic context, I saw an opportunity to theorize the embedded knowledge of whatu as a research approach that emerged from within the research topic - that is whatu and Māori women. The opportunity to theorize whatu as methodology required me to look with deeply theoretical and decolonizing eyes in order to “see” the theory that existed there.

I learnt that theory is everywhere if we only have the eyes to see it – and the ears to hear it. It does not reside exclusively in Western academic literature or with distant and disconnected theoreticians. I was reminded that astute theoreticians walk both physically and spiritually amongst our own people. As Goodyear-Ka’ōpua reminds us “the theorists of my academic genealogy include the women of our family who formulated their ideas through love and daily struggle” (2007, p. 53). By positioning my daughter as a theorist I acknowledged her key contribution that enabled me to understand aspects of whatu weaving that I had not previously. In doing so she prompted me to “see” more clearly the relationship between Māori women and whatu kākahu, and to then theorize an appropriate research approach from within this relationship.

I learnt that theorizing Indigenous knowledge, in this case viewing our world through Whatuora - well and healed eyes - is not a final destination. Instead, viewing our lived realities through Whatuora is a constantly engaged process of learning, listening consciously and critically, decolonizing using the tools and materials at hand in the present – with an eye to the future. For me, enacting a Whatuora approach therefore did not end with the research. Instead, Whatuora has become an internalized way of thinking about *being* and *living* in the world as a Māori woman and as such both the theory and practice of Whatuora is woven methodically and consciously into the way I live and research.

Summary: tying off some threads and picking up others

Re-weaving how we think about methodology is a necessary and political research activity. This chapter draws on Indigenous decolonizing tools and arts-based theory to unpick the fabric of Western research methodology and then re-weave it as a transforming praxis of Indigenous thinking and doing – theory and practice. When we re-complexify accepted notions of methodology we create space for “new” methodological knowledge to be awakened from “old” arts practice that seeks to activate a decolonizing politics useful to address our current lived realities. By theorising our own methodologies, Māori and Indigenous researchers are re-weaving knowledge fragmented through colonization, then re-presenting this knowledge in new and useful scholarly ways. It is imperative that Indigenous arts researchers continue to decolonize our own research whatu (lens) in order to “see” not only our research topics through Whatuora (well eyes), but to simultaneously develop our own approaches to tell our stories in ways that create positive transformation for our diverse Indigenous communities.

Indigenous research methodologies drawn from artistic practices create space in the Western academy to view and conduct research through an Indigenous artistic lens. Kovach (2009) says that, in her early academic career, there was a paucity of theoretical literature that centered Indigenous conceptual frameworks and tribal knowledge. I join Kovach, Pihama, Lee and many other Māori and Indigenous scholars, to encourage, almost implore Indigenous researchers look to our own systems of knowledge to develop methodologies to investigate our problems, and make visible the ways in which we see the world. Often activated by decolonizing politics, Indigenous researchers continue to develop and use Indigenous approaches to speak back to Western research practices that marginalize Indigenous knowledge. In doing so Indigenous methodologies continue to re-weave and re-present Indigenous methodologies as valid and legitimate academic approaches to research and, more importantly, as capable of contributing to positive transformations for Indigenous people.

I share Whatuora as an example of a theorized Indigenous arts methodology that emerged from within whatu the Māori practice of cloak weaving. Theorizing a methodology from within its very practice and language, enabled a way to talk with Māori women about how they work in active ways to decolonize their lives, finding strength and reassurance that their children and grandchildren will live self-determined and positive identities “as Māori”. Whatuora is forwarded as an original contribution to countless other decolonizing ideas and actions, played out here in Aotearoa New Zealand and in global Indigenous research, that theorize our ways of being and doing to address challenges now and for the future.

Much like weaving a cloak, the artist makes the most of the materials available to her and when a new idea or resource is presented, she employs her adaptive expertise and innovation, twined together with her traditional knowledge, to make something new. This chapter is a call to other Indigenous arts researchers to take up the threads of innovation and creativity, activism and theorization to create “new” theoretical ideas from “old” sets of arts knowledge.

Introduction & self-location

Ey swayel, in the Halq'emeylem language means, good day. I write this chapter on the traditional and unceded lands of the X'məθk'əyəm (Musqueam), Skwxwú7mesh Úxwumixw (Squamish Nation) and Səlilwətaʔt (Tsleil-Waututh) Indigenous peoples of the Vancouver area of British Columbia (BC), Canada. Q'um Q'um Xiiem tel skwix- my Indigenous name is Q'um Q'um Xiiem. It means strong clear water. I am also known as Jo-ann Archibald. I am a member of the Stó:lō First Nation, whose traditional and unceded lands are in southwestern British Columbia, in the Fraser Valley area. I also have ancestry in St'át'imc First Nation, in the community of Xaxli'p, near Lillooet, located in the interior of BC. Stó:lō in the Halq'emeylem language, means, river. The term, unceded, means that First Nations have not "legally signed away their lands to the Crown or to Canada" (Wilson, 2018, p. 27).

This article begins with an introduction to who I am, as an Indigenous person. Indigenous scholarship often begins with the standpoint of identity, place, and community so that the reader has some contextual background about the author as a way to know where one comes from, culturally, geographically, politically, and more (Kovach, 2021). This form of self-location is part of an Indigenous methodology that is intimately linked to personal story as a foundational aspect of Indigenous knowledge. For those new to Indigenous people in Canada and British Columbia, I will provide basic background information to aid in understanding my self-location.

According to the 2016 Canadian Census, there were approximately, 1,673,785 Indigenous people who self-identified as either First Nations/Indian, Métis, or Inuit (FNMI), constituting 4.9% of the total Canadian population. FNMI peoples and their rights are acknowledged in Section 35 of the Canadian Constitution. The fastest growing segment of the Canadian population were young people under the age of 25, at 44% compared to 28% of the non-Indigenous population (Statistics Canada, 2017). In British Columbia, there were 270,585 FNMI, constituting 6% of the BC's total population (Statistics Canada, 2017). There are 34 First Nation languages spoken in BC in 203 First Nations communities (Dunlop et al., 2018). There is a rich diversity of Indigenous languages and cultural communities in British Columbia. I speak from the perspective of a First Nations person who grew up in a reserve community, attended public schools and university, and then became a school teacher and university professor. I did not have the opportunity to learn my Indigenous language, Halq'emeylem, in my home community or in educational systems that I attended due to colonial laws and policies, which will be discussed later. In this article, my personal stories exemplify aspects of Indigenous education, Indigenous ways of knowing, and an Indigenous methodology. I share three of my lived stories and one traditional story. Story characters such as Old Man Coyote and Owl also share their perspectives. Now to start with my personal story.

I grew up in Stó:lō territory, so I identify, culturally, as Stó:lō, which means people of the river. Soowahlie, is the name of the reserve community, where - as as child I had lots of freedom to play in the fields, woods, and streams with my cousins. I was fortunate to have spent time with my paternal grandparents, who lived beside us. As I reflect on my childhood, I feel fortunate to have had some place-based learning experiences with my immediate and extended family members. Fast forward to my adult years, as a beginning school teacher, I returned to the Stó:lō area, to teach primary level grades (2–3) in the public schools in 1974.

In the Stó:lō area, during the 1970s, a cultural revitalization movement was gaining momentum as a resistance response to a century of federal government laws, policies, and practices that focused on the assimilation, cultural genocide, and usurpation of lands of Indigenous peoples in Canada (Carlson, 1997). Some Stó:lō community leaders and Elders began to meet in each other's homes to revitalize and document, in written form, their Indigenous Halq'emeylem language, to discuss history from their perspectives, and to reclaim cultural values, stories, and practices (Archibald, 2008). In 1973, the Coqualeetza Cultural Education Center (Coqualeetza) was established as a non-profit charitable organization to serve Stó:lō communities and the wider Indigenous population with cultural programs and services (Coqualeetza Cultural Education Centre, 2010). The Coqualeetza Elders' Group became

a program of this center and those who were meeting previously, continued to meet and to revitalize Stó:lō culture and knowing through this program (Archibald, 2008).

In 1975, I began to attend some of Coqualeetza's cultural programs such as the Halq'emeylem language class, hide-tanning workshops, and a basket-making class. I was grateful to have these cultural-learning programs available because I had not participated in some of these cultural activities during my childhood. These types of cultural life-ways were forbidden through Canadian laws such as the Potlatch Ban where people could not gather for ceremonies or cultural activities and through education systems such as the Indian Residential Schools (Royal Commission on Aboriginal Peoples, RCAP, 1996) where children were separated from their families from the ages of 6 (sometimes younger) to 16, often to attend a school far from their home community for the school year. In these schools, numerous children experienced physical, sexual, and emotional abuse. They were forbidden to speak their Indigenous language, fed sparingly, were not allowed to practice their culture, and received a poor academic education (Truth and Reconciliation Commission of Canada, TRC, 2015). Many died while trying to run away from the school, to run back to their homes, or they died from disease such as tuberculosis. My mother and some of my grandparents attended Indian Residential Schools. At the time of this writing, many former Indian Residential School sites are using ground-penetrating technology to identify children's unmarked grave sites, after 215 unmarked graves were identified at the former Kamloops Indian Residential School in May 2021 (Snucins, 2021). I share this difficult impact of colonial history because all citizens of Canada have inherited this terrible legacy, but it is the generations of Indigenous people and their families, who have suffered and continue to experience inter-generational trauma and effects that are personal and at the same time, impact one's family and community. In the 1970s, I knew about some of this colonial history, but I had not thought critically about the prominent role of government and religions/churches in perpetuating colonization. As an adult and teacher, I was keen to learn more about Stó:lō cultural ways to strengthen my cultural identity.

Story memory: making a cedar basket

In 1975, I attended a summer basket-making class, sponsored by Coqualeetza. I was excited to attend because one of the master basket-makers, Teresa Michell, was teaching the course. She was also a very well-respected member of the Coqualeetza Elders' Group. I remember walking into the room where the class was held: a large room with lots of windows and tables and chairs. There were other women in attendance. I saw Elder Teresa Michell sitting at a table with a plastic tub of water filled with strips of cedar root material, and a small basket that she was weaving. Some of the women were seated at the tables with their cedar pieces. Some were weaving and others were sitting and visiting with them. I wondered if I had missed some of the instructions of the class because Elder Teresa was working away on her basket and not giving any whole or small group instructions. I just sat, watched, and waited, hoping that she would start telling us what to do. I kept watching as some women would sit with Elder Teresa and she would show them what to do, using her cedar pieces. Then they tried to copy her process. Eventually, I picked up the cedar pieces and began to follow what they were doing. When I needed help, I sat beside Elder Theresa to show her my work and to get her feedback. Sometimes, other women helped me.

This memory of experiential or "watch-then-do" learning has stayed with me for more than four decades. Even though I may not remember the details, what I remember, is the different teaching approach, where the Stó:lō teacher expected the learner to do lots of observation, then try the activity, and to seek help when needed. This approach is an Indigenous way of knowing (teaching and learning) that brings together, inter and intra-generational, experiential, observational, and mentoring approaches that are vastly different from direct and didactic instruction. I had expected the latter. My experiences with public school and university learning were more of the later. I had expected to sit down and that Elder Teresa would show us, the learners, a step-by-step approach where we would do each step with her as the teacher and where we as the learners, might interrupt her instruction, especially when we did not understand the directions. In the reflection and discussion section, I will return to this story and other stories that follow.

Story memory: The Elders' fish camp

Another story memory that I recall is about learning from Stó:lō Elders at their annual summer fish camp held near Yale, BC, where fishers donated sockeye salmon to the Elders for wind-drying and canning purposes. A few of us "young" people who were Coqualeetza staff and family members stayed at the fish camp to help with the fish preserving processes. I learned how to clean and cut the salmon so that it could be put on long thin poles, which were hung under small wooden wind-drying structures that had open sides and a roof. In the summer, the Yale area is windy and often has fairly hot temperatures; perfect conditions to let the salmon dry naturally. By that time, I had learned to watch the Elder do his/her work and then I tried to do it, with their watchful guidance. I already knew how to cut the fish for canning purposes, so I helped as needed. The Elders and the helpers would stay at the fish camp in tents or campers for a week or more, with some going home and returning the next day. I had a truck/camper, so I stayed with the Elders. I remember the laughter and teasing while we worked, and the stories that were told around the camp fire during meal times and in the evening. Mostly, I recall the feelings of being loved by the Elders, similar to the feelings of love from family members. I think that the Elders valued the interest and caring of the younger helpers, so that the Elders could continue the tradition of passing on their cultural values, knowledge and skills, albeit with newer tools. There were various Elders with particular talents and skills and all participated in the food preserving work accordingly. The Elders shared the teaching

responsibilities by using each other's 'gifts' or talents; no one person was considered the main teacher. The Elders' pedagogy at this fish camp continued to include inter and intra-generational, experiential, watch-then-do one-one or small group mentoring approaches. The Elders' love and caring made the young helpers feel valued and the inclusive approach ensured that everyone participated and contributed to the learning activity.

Story memory: becoming storywork ready

In 1976, in my role as a school district Indian Education Coordinator for elementary schools, I was invited by the Coqualeetza Cultural Education Center to assist with the development of an elementary school curriculum about Stó:lō culture (past and present). Coqualeetza was sponsoring this curriculum project, which was being led by the Coqualeetza Elders' Group. An advisory group, subsequently named the Stó:lō Sitel Advisory Committee, for which I was a member, was established that included educators, community members and Coqualeetza staff. This advisory committee provided policy guidance for this curriculum. Stó:lō *sxwoxwiyam* or traditional stories, and associated cultural knowledge became a core part of this curriculum that was prepared for the subject of social studies. At that time, the only subject area that provided an opening for using Indigenous topics as a locally developed curriculum was social studies.

The Elders met every Wednesday. A member cooked lunch for everyone and another member said some prayerful/thankful words before the food was shared. Then the Elders got to work. They worked with a linguist, the Coqualeetza staff, and other educators, such as myself. They would document the Halq'emeylem language, moving from the oral into a written form. This same approach was used with their stories where many remembered the stories told orally in Halq'emeylem during their daily life activities, before going to sleep at night, and during cultural events. During the documentation sessions, the Elders were translating the stories from Halq'emeylem to English and from the oral to the written form, which was in English. Some of that material was eventually tape-recorded, which was the main type of technology in use at that time. Those working on the curriculum ensured that the Elders held decision-making roles about all aspects of the curriculum process from the content (knowledge, stories) to learning approaches and published format.

With the Elders' permission, the meeting documentation and audio-tapes were subsequently used for developing the curriculum materials. This material has remained with Coqualeetza. A core purpose of this curriculum was to have it available and used in both public and band/Stó:lō schools. The Elders wanted to ensure that children, especially Stó:lō children, were able to learn about Stó:lō history and culture and ways of knowing from the perspective of Stó:lō people. The Elders named this curriculum, the Stó:lō Sitel. In Halq'emeylem, *sitel*, is a basket that holds treasured materials. The Elders believed that the Stó:lō curriculum contained treasured knowledge, values, and perspectives. Teresa Michell, a member of the Coqualeetza Elders and who is featured in the first story, wove a sitel basket to hold an original copy of the curriculum materials. At that time and still today, the majority of Stó:lō children attend public schools. The Elders felt that all children needed to learn about Stó:lō people so that a better intercultural understanding was developed amongst all students, for the long term goal of educating future citizens. The Elders' inclusive educational approach that began in the 1970s is a prime example of reconciliation as advocated 45 years later by the TRC: that students develop intercultural understandings through education (TRC, Call to Action 62, 2015).

The Elders also approved both the text and the artist's images for each story. Those of us working on the curriculum felt that it was our responsibility to ensure that the oral story was transferred to a new format, such as a published story book and that the story pedagogy, through teaching units and lesson plans were all satisfactory to the Elders. Today the term, authentic, is used when recommending types of Indigenous learning materials to use for educational purposes ([First Nations Education Steering Committee and First Nations Schools Association, 2016, 2021](#)). The Stó:lō Sitel curriculum is an example of authenticity. The Elders also fulfilled their cultural responsibility to pass on cultural knowledge and ways of knowing as they took the necessary time to remember, think about, talk about, or engage with particular stories. Each week when they would meet, the curriculum staff would show them what had been done with their story. They would either approve it or tell the staff what changes needed to be made.

This verification process also demonstrated respect because the curriculum staff wanted to ensure that the Elders felt comfortable and agreed with how their knowledge and stories were being used. In order to achieve this goal, we as the working group, took time to develop a respectful relationship with the Elders so that they could trust that we were carrying out our educational role, in good/ethical ways. Respect and responsibility often go hand-in-hand.

I left the Stó:lō territory in 1985 to work at the University of British Columbia's Vancouver campus with the Faculty of Education's Indigenous Teacher Education Program (formerly known as the Native Indian Teacher Education Program-NITEP) and then enrolled in a PhD program in 1989. During my PhD research, I was guided to learn more about the role and pedagogy of Indigenous stories, with a focus on Stó:lō and Coast Salish traditional and life experience stories. During the Stó:lō Sitel curriculum work, I learned to value the care and attention that the Elders demonstrated with documenting and using some stories for learning purposes. However, in my graduate student role, I felt that I needed to know more about Indigenous oral traditions, the role of storytelling, the relationship between stories and learning and teaching, and how colonization changed traditional Indigenous storied ways. To learn about these matters, I knew that it was necessary for me to return to my original teachers, the Stó:lō Elders, who were still working with Coqualeetza, to ask for their guidance in this next phase of my learning. This time, I focused on learning through the work of research.

My doctoral research learning journey spanned four years, learning from the Coqualeetza Elders, other Coast Salish Elders and Indigenous storytellers; learning from the small but growing literature written by Indigenous scholars and non-Indigenous allies

who worked respectfully and responsibly with Indigenous stories; and learning by doing/working with educators on other school curriculum that included stories as a core component and using stories in my university teaching practice. I was able to use some of the Elders' regularly scheduled meeting times where we discussed their experiences of listening to and living with stories throughout their life span; training methods for becoming a good speaker and storyteller; cultural contexts and protocols for stories, and their concerns about the use of and sustaining stories. We had many good talks over a one year period. As a result of these research and educational experiences, I developed an Indigenous storywork (ISW) framework that included seven principles of respect, responsibility, reverence, reciprocity, holism, inter-relatedness, and synergy. Indigenous storywork can be used for theoretical, methodological, and pedagogical purposes (Archibald, 1997). The origin of the name, storywork, comes from words that are said by a spokesperson at Stó:lō cultural gatherings, who knows about and facilitates the gathering's cultural work. To signal the start of the gathering, the spokesperson will say something like, "My dear ones, the work is about to begin." When the guests hear those words, they give their full attention to the work that is about to take place. I brought the concept of story together with work, so that when the name, Indigenous storywork, is heard or read, it signals that it is time to give serious attention to learning from and working with Indigenous stories.

Before I finished my doctoral dissertation, I returned to the Coqualeetza Elders to share what I had learned about the power and beauty of Indigenous stories; how stories could become like teachers; and how research could be carried out in ethical ways with Indigenous peoples' stories. I thanked them for their valuable guidance and later provided copies of my dissertation to Coqualeetza. My family also hosted a ceremony and feast to acknowledge the completion of my PhD and to thank those who had helped me on this journey.

It took many years before I felt comfortable and ready to turn my doctoral dissertation into a book. A demanding UBC work schedule, personal family responsibilities, and anxious feelings about how others would perceive Indigenous storywork kept me from proceeding with the book publication. I had continued to use the Indigenous storywork principles in my teaching practice and some research projects, so I believed that they were useful for educational and research purposes and could be used by others. Issues about disrespectful research were prevalent in the literature such as appropriation of Indigenous knowledge (Armstrong, 1993; Keeshig-Tobias, 1990; Maracle, 1992) and lack of Indigenous engagement in research decision-making and methodology (Smith, 1999). Despite these issues, my colleagues kept encouraging me to publish this work because they believed that Indigenous storywork contributed in positive ways to both research and education. They gave me useful suggestions for revising the manuscript that I produced. I kept revising the manuscript, until one colleague said that it didn't need any more revision and that it was time to submit it to a publisher. And it was sent. Finally in 2008, *Indigenous Storywork: Educating the Heart, Mind, Body and Spirit* was published by UBC Press.

Reflections and discussion

After sharing the three sqwelqwel-true stories, I had intended to write a reflection about what I had learned about Indigenous ways of knowing and Indigenous research from living and telling these stories. I will include reflective understandings of becoming storywork ready for both education and research purposes, through the use of the sqwelqwel stories, but there is an interruption that needs space here. Until now, I had resisted including a sxwoxwiyam-traditional story that has facilitated my understandings about education and research. I resisted because I have told and written about a particular Coyote story many times and wondered if instead, I should try another storied approach, which became the three sqwelqwel stories noted above. However, I was recently reminded that Elders and storytellers have often said that stories can be told over and over again. The Elders heard the same stories throughout their lives, so that the stories became a part of them, embedded in their heart, mind, body, and spirit. They also said that new ideas could surface from a story, depending on what the storyteller or listeners are open to and ready to experience. The Indigenous Trickster character of Coyote has become my critical story friend and helper throughout my doctoral journey and subsequent scholarly work. So, it is time to give Coyote space and voice in this part of the article. Before Coyote's story is told, I acknowledge that Eber Hampton of the Chickasaw Nation and university educational leader in Canada, told this story, which does not originate in Stó:lō territory. He eventually gave me permission to use this story and encouraged me to adapt it for my cultural context, so I renamed the Trickster, Old Man Coyote. Here is the story.

Old Man Coyote's story: searching for the bone needle

Old Man Coyote (OMC) had just finished a long, hard day of hunting. He had walked a long, long way through fields, up mountain trails, and along valley streams. But, he did not catch anything. He found a nice clearing to set up his camp for the night and started a fire for his meal. The fire burned brightly and after supper, OMC sat by the cozy warm fire and rubbed his tired feet from the long day's walk. He took his favourite moccasins out of his bag and noticed that there was a hole in the toe of one of them. He looked for his special bone needle to mend the moccasin but couldn't feel it in the bag.

Then Old Man Coyote started to crawl on his hands and knees around the fire to see if he could see or feel the needle. He went around and around the fire many times. Just then Owl came flying by and landed next to OMC. Owl asked him what he was looking for. Old Man Coyote told Owl his problem.

Owl said that she would help her friend look for the bone needle. After she made one swoop around the area of the fire, she told OMC that she didn't spot the needle. Owl asked OMC where he last used the needle. Old Man Coyote thought for a while then said that he used it quite far away, in the northern direction, to mend his jacket. Then Owl asked OMC why he kept going around and around the campfire when the needle clearly was not there. Old Man Coyote replied, "Well, it's easier to look for the needle here because the fire gives off such good light and it is warm and cozy." (adapted slightly, Archibald, 2008, pp. 35–36).

Many times, I have observed people acting like Old Man Coyote in educational systems, who get used to a way of thinking and doing and who do not really want to change their pedagogy or policies to create space for Indigeneity, which includes Indigenous ways of knowing, increasing the enrollment and retention of Indigenous students, teachers, and staff, and engaging Indigenous communities in meaningful decision-making roles. Calls for including Indigenous knowledges, values, history, languages, pedagogies and Indigenous peoples' involvement began through national policy documents in Canada such as Indian Control of Indian Education (National Indian Brotherhood, now known as the Assembly of First Nations, 1972), and continued with research resulting from the Royal Commission on Aboriginal Peoples (1996), and is still prevalent in the historical and current impact of Indian Residential Schools as portrayed in the Truth and Reconciliation Commission of Canada's Calls to Action (2015). At provincial and territorial levels, similar recommendations are also found (Archibald and Hare, 2021). Yet, some progress has been made to include Indigeneity in educational systems, but the overall progress is fairly slow and sporadic (RCAP, 1996; Archibald and Hare, 2021). At the same time, I have observed and worked with many Indigenous and non-Indigenous allies, at all levels of education whose work has included Indigenous perspectives and ways of knowing, especially through the use of Indigenous storywork (Archibald et al., 2019; Nicol et al., 2020). But Coyote figures it is time to highlight his role and impact with Indigenous storywork (Coyote's perspectives will be shown in italics).

Old Man Coyote. Finally, Q'um Q'um Xiiem (I will use her Indigenous name, which I prefer) has given me an opportunity to tell what I think about her sqwelqwel stories. It was really hard for me to be patient, to listen carefully, and to give my full attention to her stories. Besides, there was nothing about me in those stories, so it was hard for me to pay attention, although I am sure there were Coyote-like moments when people did not listen to each other, or tried to out-story one another, or tried to hurry and finish the stories. At least Q'um Q'um Xiiem found some stories about me and other Trickster characters that pointed her in the right direction for developing the Indigenous storywork principles- but it took her such a long time.

However, I was happy to travel with her on learning journeys about Indigenous storywork, especially, watching her learn to hear what the Elders were saying about the importance of stories to provide teachings if one is open and ready to engage with the story by using one's senses to address the heart, mind, body, and spirit. Usually, I am pretty good at the body/physical, but I don't like to think about what I have learned or what I could have done better, or how to recognize my own or others' feelings. Reverence still has me stumped! However, I am fortunate that the Owl continues to be my friend. She helps me in many ways. After staying near that cozy fire long enough, I knew that I would have to move away from the fire, to find the bone needle. Owl reminded me that I need to care for that needle so that I can use it when it is needed. Maybe that bone needle is like Indigenous stories, if we take care of them, they will sustain us. Or is it the other way around? Stories will take care of us, if we are open and storywork ready. Now, it is time to return to the sqwelqwel stories for educational purposes.

Becoming storywork ready for education

The basket-making and fish camp stories featured Stó:lō ways of knowing and Elders' pedagogy during cultural activities. The sqwelqwel stories are also a form of knowing and an example of an Indigenous pedagogy. When I attended various Elders' meetings and cultural activities, their talk was often in the form of sqwelqwel or true life-experience stories and sometimes included sxwox-wiyam or traditional stories. My own family ways of teaching and learning included similar approaches of watching and then doing. An action of respect is to listen and to observe, without interrupting the teacher or mentor. During the learning experience there is time to ask questions and opportunities to ask for help, when the time seems right. Knowing when the time is right, depends on the rhythm and difficulty of the activity. When someone interrupted or did not follow this pedagogy, I used to hear older people say to each other, "(that person) has no teachings," which I believed to mean that person did not know or practice the principles of respect, or that their needs were more important than others, or that they did not have patience, which were forms of disrespect. I wondered why Indigenous people would be disrespectful. During my graduate education I began to understand why. For decades, the predominance of Euro Western values and pedagogies in public educational systems, from kindergarten to post-secondary, have disallowed or marginalized Indigenous knowledges and pedagogies (Battiste, 2013).

My own experiences in public schools were such that I never felt proud of being Indigenous and when Indigenous topics were brought up, I could not identify with the Indigenous people or images being portrayed, since they were negative, fraught with problems, and often stereotypical. Yet, I lived an Indigenous life in an Indigenous reserve community. It was as if the Indigenous people being portrayed in the curriculum were not real. Even though there were social and other problems that people in my reserve community experienced, they were real people and family members cared for them. In relation to the time period that I attended public school, the stereotypical and racist portrayals of Indigenous people or omission of Indigenous contributions to Canada in public school curricula, particularly in the subject area of social studies were identified in evaluation research as pressing issues from the 1960s to 1970s (McDiarmid and Pratt, 1971; Manitoba Indian Brotherhood, 1974; Werner et al., 1977). A similar recommendation stemming from these studies emphasized the need for Indigenous people to be involved in developing and implementing Indigenous themed-curricula. As the story about the Stó:lō Sitel curriculum shows, the Coqualeetza Elders were living this

recommendation. I think that my commitment to improving education through systemic change traces back to my negative experiences in public school.

I persevered through the grades and did well academically to graduate high school. Upon reflection, I was fortunate to have had a positive home life and experienced many community-oriented activities, which I attribute to facilitating my educational success in public schooling. However, my schooling did not contribute to my Indigenous identity development or knowledge of Indigenous matters. Often, I felt like I lived in two very different worlds: one was the school life and the other was my family/community life. Now, I understand why some Indigenous people may act like they “have no teachings” because their public schooling did not accommodate Indigenous epistemology and pedagogy. Colonial laws and policies disrupted the family and community continuity of Indigenous knowledge and ways of knowing for many generations. They may have been adopted, fostered, and put in care with families that were not Indigenous and did not value or appreciate Indigeneity (RCAP, 1996; TRC, 2015).

The inter-generational impact of Indian Residential Schools in Canada has become more widely known in Canadian society since the release of the national Truth and Reconciliation Commission of Canada’s report and Calls to Action in 2015 and then the recent deluge of media reports about the growing numbers of unmarked graves being found at former residential school sites during 2021 (Malone, 2021). Another national inquiry, this time, the *National Inquiry into Missing and Murdered Indigenous Women and Girls* (2019) adds to the growing Canadian public’s interest, including post-secondary students, to know the “truth” of Indigenous peoples’ experiences, not only of residential schooling, but of on-going forms of colonization occurring through various sectors of society. I believe that the heightened interest and moral need to do better in relation to Indigenous peoples stems from the powerful personal lived stories that residential school survivors and Indigenous women and their families have shared. They have enacted their responsibility to tell their stories so that others will know and understand the intergenerational impact of colonization and that those of us who listen and understand the stories will contribute to making positive changes in the systems in which we are located. Old Man Coyote wonders how he can make systemic change.

Old Man Coyote. So much to consider in becoming storywork ready for educational purposes! I was quite happy staying by that cozy fire. Then Owl said that I have to work on myself before using those ISW principles, especially respect, responsibility, reverence, and reciprocity. In response, I figured that my knowledge of Indigenous ways of knowing and Indigenous pedagogy could be strengthened. My first step was to read books, especially ones Indigenous Elders had written, alone and with others, that focused on their stories. I was hoping that they included Tricksters like me. I sure liked “Khot-La-Cha: The Autobiography of Chief Simon Baker,” which was compiled by Verna J. Kirkness (1984). He learned a lot from his grandmother and used humor throughout his life story, even though there were troubling times that he experienced. He was a well-respected and resilient community leader. Khot-La-Cha respected his grandmother’s ways of teaching him and then carried out his responsibility to share this knowledge and to mentor the younger generation. Q’um Q’um Xiēm has said that Khot-La-Cha was always willing to help the younger generation because he knew that by mentoring them, he was continuing Indigenous ways of knowing. Since I spend lots of time on the unceded lands of the Skwxw7mesh Úxwumixw-Squamish Nation, where Khot-La-Cha was from, I thought that I should learn about Skwxw7mesh Úxwumixw history and perspectives as an action of respect and responsibility.

I was amazed by Kwulasulwut, Ellen White’s book, “Legends and Teachings of Xeel’s, The Creator” in which she tells four traditional stories that were passed from her ancestors, to older family members, to her. She worked with her daughter Vicki White, thereby, continuing an inter-generational pedagogy. In this book, first published in 2006 and reprinted in 2018, Kwulasulwut and Vicki talk about the story to provide contextual and cultural information for the reader and to share some ideas about the story to spark meaning making for the reader. Kwulasulwut from the Snuneymuxw First Nation of Nanaimo, BC, was a wonderful storyteller, healer, and educator. She demonstrated all of the 4R principles: respect for her ancestors’ stories and teachings by learning and authentically presenting them; responsibility of mentoring and guiding others to learn from the stories; reverence for the spiritual nature of the stories; and reciprocity by continuing to ensure that the stories are told and used, thereby, continuing the cycle of learning through stories. Q’um Q’um Xiēm also said that Kwulasulwut helped her appreciate the ‘core’ of a story (White and Archibald, 1992): somehow that core knowledge makes the story timeless, maybe it has to do with knowing the values, philosophy, or teachings of the story?

In their books, these two Elders shared traditional ways of knowing and learning, which are similar to the first two stories told by Q’um Q’um Xiēm about basket-making and fish camp, although she also calls them examples of Indigenous pedagogy. But Khot-La-Cha also talked about his difficult experiences at Indian Residential School, and what he and other kids did to survive. There are many more new books and films where Indigenous people tell their tragic stories, yet, they also demonstrate their resistance and resilience to this form of colonial education (Sellars, 2013; Webstad, 2019). These are the ‘truths’ that all Canadians must know and that must be placed within school curricula, so that the next generation of Canadians has a better understanding of the impact of colonization.

Then, I started reading more critically about the power of EuroWestern educational systems and a term that Indigenous scholar Marie Battiste used to describe this type of domination: cognitive imperialism (2013, p. 158). She also made me think about the need to be engaged in decolonization of education. Wow, that perspective made me think hard. Now, I am tired and need to rest. But, I am getting off track here, and Owl reminds me that I need to stay focused on Indigenous stories. But I tell her that all this reading has added to my basic knowledge about the struggles of decolonizing my thinking and actions so that I can be more open to letting the stories sustain me. Owl wants to take me on a journey to see what other Indigenous storyworkers are doing. I agree because I want the stories to look after me. But first, Q’um Q’um Xiēm has more to say about how research sparked the notion of becoming storywork ready for this purpose. I hope that she does not expect me to do research too!

Becoming storywork ready for research

In this section, I discuss the story memory of becoming storywork ready. This lengthy story includes my two journeys of learning that I experienced with the Coqualeetza Elders. Even though the first journey focused on revitalizing Stó:lō sxwoxwiyam stories for

educational purposes, I discuss that experience in this section to illustrate notions of research readiness. In fact, the Elders and others involved in the curriculum project undertook activities that involve methods of qualitative research, such as convening discussion/focus groups, asking open-ended and semi-structured questions, analysing the responses for common themes/topics, verifying and portraying these themes/findings in written and other material, and then disseminating the findings more broadly (Mishler, 1986; Hammersley and Atkinson, 1983). However, the group also carried out activities that exemplify what we now call, Indigenous methodologies, such as relationship building, ensuring that Indigenous people have decision-making roles throughout the research process, using Indigenous knowledge to structure the methods, analysis, and dissemination, and to ensure that research is beneficial to Indigenous people and their communities (Battiste, 2013; Kovach, 2021; RCAP, 1996; Smith, 1999, 2012; Wilson, 2008).

I developed a working relationship with the Coqualeetza Elders and staff members. My grandfather was a member of this group, so the Elders knew me through my family kinship and community location, but they did not know me personally. I recall feeling intimidated meeting with the Elders, at first. There seemed to be a large group of about 25. Many I did not know. Throughout my childhood and early adult years, I had learned to show respect and reverence to Elders who carried out their responsibilities in good, caring ways. Not all older people are Elders who take on a teaching/mentoring role and who live good teachings. Young people were expected to help and serve Elders food, if they indicated that they wanted help. Many preferred to get their own food and refreshments. But, they showed appreciation for the care shown by the younger people. During the more formal part of the Elders' session, I had the role of asking questions for the curriculum work. I recall some anxious moments when there was silence, or when the Elders did not respond to my questions, and sometimes they would speak quietly to the person next to them. One of the curriculum staff, who had very positive relationships with the Elders would help me by talking more about the intent of the question. Yet, there were silences. I learned to observe these silences and the Elders' reactions to the questions. Eventually, I became comfortable with silence because I knew that they were thinking about the question and forming their response or that they did not have anything they wanted to contribute at that moment. Sometimes, a week or more later, an Elder would bring up the question that was asked earlier and would share thoughts about it. Elders would mention that they had put certain knowledges to sleep and that it took a while to awaken their memory of it. I attributed their perspective of putting knowledge to sleep in response to colonial methods of oppression and denial of Indigenous knowledges. Perhaps they hoped for a future time to re-awaken their ways of knowing in a safe environment. Revitalization of Indigenous ways of knowing need time, additional effort and patience, cooperative engagement, and questioning through a decolonizing process (Archibald, 2008; Kovach, 2021; Smith, 2012).

On my second journey of returning to the Coqualeetza Elders for my PhD research, I first focused on re-establishing a responsible learning relationship with them. It had been over five years since I had worked with the Elders on the curriculum project. I followed ethical procedures for seeking their permission for me to carry out this research project with them, via their Elders' Council, as well as acquiring university ethics approval. The Elders' Council included a few members of the larger Elders' group who made decisions of this nature. I met with them to discuss my motivation and purpose for learning more about Stó:lō storytelling and ways of knowing through story and to seek their guidance and direction on how to proceed with these topics. I recall feelings of relief and excitement when they agreed to work with me, and this time, I felt more comfortable because of the previous relationship I had with them and that they voiced how important Stó:lō stories and the oral tradition were to them and their families and communities. This project was a way to continue passing on their teachings. Here is what I wrote in my research journal:

[The Elders Council] ... liked my work and said it was important to do; so many Elders have left us. We talked about the importance of stories for teaching and how they help us to live right-to be good human beings. Such a relief not to be doing this important work alone, but to have guides. (Archibald, 2008, p. 61).

During the second research period that I spent with the Coqualeetza Elders, I was better prepared and more confident to talk to them about my ponderings and questions, and to listen to their storied responses with my "three-ears." Various Elders have used this expression to indicate a deep listening with the ears to hear with and to bring that listening together with the heart/emotions/spirit. The Elders often told sqwelqwel stories in response to my questions. After our discussion sessions, I would go away, transcribe the talk/stories, and listen to it many times, to discern both common and different ideas, issues, and teachings. This term, teaching, is often used to mean Indigenous values, beliefs, knowledge, and way of knowing-all wrapped up in one concept. Two Indigenous storywork principles became evident in my meaning-making with the Elders' lived stories: holism and inter-relatedness. I identified parts of their stories that touched my heart (emotions), mind (intellect), body (actions), and spirit (spiritual) for a holistic beginning. I also thought about the stories in relation to their historical and current day experiences, and the cultural and education contexts for working with stories as an inter-related understanding.

The range of stories and perspectives related to what makes a good storyteller, becoming storytellers, cultural and place-based contexts for story learning, and issues such as breaking cultural rules, reclaiming responsibility, training new storytellers, and keeping the stories alive (Archibald, 2008, pp. 65–82). After I drafted a chapter about the aforementioned topics, I met with the Elders' Council to present the ideas and to receive their feedback and approval of what I had written. I also had given those who were quoted the transcript of their words and received their approval for using their words as quotes. The verification process took a few meetings over a one-year period. This second learning journey took about four years to complete. As mentioned previously, I also engaged in other research activities with others, apart from the Coqualeetza Elders. I also worked at UBC while completing this PhD research, which also added time for completion. I mention the time period and other factors for completion

so that graduate students who work while undertaking their graduate research will know that doing both is possible, but it does take longer to complete the graduate research. For graduate students thinking about undertaking storied aspects of research, I share this research reflection to indicate that researchers must expend more time and effort to become research ready. Living the ISW principles of respect, responsibility, reverence, and reciprocity is one way to become storywork ready.

Conclusion: my dear ones, the work is about to begin

Earlier, the words, *my dear ones, the work is about to begin*, signaled that it is time to give full attention to the work about to take place at a gathering. This time, these words are used to signal that it is time to get to work. The sqwelqwel stories, ponderings by Old Man Coyote, and my reflections focused on becoming storywork ready for engaging Indigenous traditional and life experience stories for educational and research purposes. The Indigenous storywork principles of respect, responsibility, reverence, and reciprocity need to be lived to understand and use them. The sqwelqwel stories of learning from Stó:lō Elders contained these principles when they used Indigenous pedagogies during cultural lifeway activities. For example, respect was demonstrated toward both the Elder teacher and younger learner. In the basket-making story, I as the learner, was given respect and agency to participate in the making of the basket, when I was ready. I could watch as long as I needed to and then begin when I was ready. The other women learners also used their agency and enacted responsibility to help me as needed. Reverence for the cedar root material was not discussed in the story, but I know from the Coqualeetza Elders' teachings that special words of thanks were said to the tree before taking its roots and bark for making baskets and other things (Stó:lō Site Curriculum, 1983). The roots and bark were carefully taken so that the tree continued to live: all human actions were carried out with reverential feelings. Elder Teresa's way of teaching, the women learners, and my sqwelqwel story are all forms of reciprocity, a way of giving back what we were fortunate to learn, and ways of continuing Indigenous knowledge and ways of knowing for current and future generations.

Recently, I shared this basket-making story memory with a colleague and friend, a non-Indigenous educator-ally. For many years, she and I have worked together on culturally responsive educational approaches that bring together, Indigenous storywork and math education. She commented on the agency dynamic of the watch-then-do approach as the "tremendous respect for the learner and trust in the teacher seen in the space for learners to pick up the materials when ready to start." She contrasted this approach with a common pedagogy of "I do, we do, you do ... [which] assumes everyone watches then everyone does together, then everyone on their own. There is little room for learner agency with learners and the teacher [has the major responsibility of] trying to keep everybody together" (personal communication, Dec 3, 2021). I appreciated her ideas, which sparked further contemplation from me. I had not considered learner agency in that story. *Old Man Coyote says that Owl is like Q'um Q'um Xiiem's friend who gave her new ideas to consider.*

Old Man Coyote. I understand that a concluding section in an article often summarizes and wraps up/closes the article, but I wonder why Q'um Q'um Xiiem says it is time to begin the work, after I have tried to pay attention to all that has been said so far. I even used my three ears! Didn't she say that we had to give our full attention to what was to take place? Owl says she wants to finally voice her opinion.

Owl. Yes, Old Man Coyote, Q'um Q'um Xiiem said both those things. I have observed your efforts in starting to live some of those Indigenous storywork principles by learning what Indigenous Elders and others have written about such as their life stories, the impact of colonization on generations of Indigenous people and what that has done to their families and communities, and even engaging in critical thoughts about the dominance of Euro Western knowledge and pedagogy in educational systems. You have shown responsibility and used your volition to find, read, and learn from this scholarship. I especially liked that you began with scholarship originating from the traditional and unceded territory on which you spend lots of time. I believe that you have shown respect by being open to learning and thinking. Understanding and practicing reverence will be a challenge, but I know that you can do it. I look forward to seeing how you put reciprocity into practice in the future. Now, I think that Q'um Q'um Xiiem is encouraging us both to travel on Indigenous storywork pathways either alone or together. But first, I want to share my perspective about the sqwelqwel stories.

I have appreciated learning more about Indigenous ways of knowing that can also be called Indigenous pedagogies, characterized as: inter and intra-generational, experiential, watch-then-do, and storied. These pedagogies were in all of Q'um Q'um Xiiem's stories. She has told me that these are not the only forms of Indigenous pedagogy and that it is necessary to learn culture-specific Indigenous pedagogy from communities. A part of me is very sad that the Elders who lived and taught these ways of knowing have passed to the Spirit World. Another part of me is happy, that they continued to teach these ways to the younger generation, who are now passing that knowledge to others. But, it is important to recognize that it is a continuous struggle to revitalize Indigenous knowledge systems that include stories as a core component after generations of colonial oppression and dominance of Euro Western ways in educational systems. However, I know that many Indigenous educators and non-Indigenous educator allies have worked for many years to decolonize these educational systems to create good learning spaces for Indigenous knowledge systems so that truth and reconciliation as advocated by the TRC Calls to Action can take place (2015). However, this work has to include Indigenous people in meaningful ways as decision-makers and teachers for both education and research. I often hear the phrase, "nothing about us, without us" being said across Canada.

I hope that those who are interested in using Indigenous storywork for educational and research purposes will try to live those 4Rs of respect, responsibility, reverence, and reciprocity in their own lives and practices as a beginning step to becoming storywork ready. The other ISW principles of holism, inter-relatedness, and synergy were present in the stories and reflections, although they were not emphasized as much as the 4Rs. I hope that Old Man Coyote understands why Q'um Q'um Xiiem used this approach.

Old Man Coyote. Yes, I know that I need to get myself ready to do Indigenous storywork in a good way, as I have heard that term used by lots of Indigenous people. I am sure there are various meanings of that term. Right now, for me that term means having good thoughts about what I am doing and what I am learning so that those good thoughts will seep into the work I am doing with stories and then result in beneficial learning. Maybe I will do a better job of looking after that bone needle in the future. Hey, Owl, didn't you say that we were going to see what other storyworkers have been doing? Maybe they have a fancy kit to share with us. Oh-oh, Owl is giving me the look, that means I should know better.

Thanks to Old Man Coyote and Owl for sharing their story and perspectives. I will have to tell OMC that the growing cadre of educators involved in Indigenous storywork resist the approach of preparing ready-to-use kits. The Coqualeetza Elders would smile at OMC and then continue to do their work, while OMC watches.

Introduction

When what counts as science and as ecological knowledge is narrowed to only include Western settler perspectives, scientific understandings, conversations, education, and access to environmental knowledge are limited to only one view. This paper discusses Indigenous land management practices outside of the contexts of settler colonialism in the United States. In addition, it explains the importance of utilizing diverse knowledge systems and perspectives within environmental education, on the ground land management practices, and land management policy decisions.

This article begins by describing why there is a need for diversity in science and natural resource education. I define Indigenous Knowledge Systems (IKS) and include the impacts that settler colonialism has had on Indigenous peoples of the United States. Utilizing fire management as an example, I illustrate the limitations and consequences of utilizing one scientific perspective in environmental land management. I also discuss settler colonialism from a land management perspective and how such an approach removes the Indigenous peoples from place. Removal includes not only the people but also their worldviews including those relating to land management practices. I end with a discussion the Sustainable Community Food Systems Bachelors of Applied Science (SCFS-BAS) degree program at the University of Hawaii, as an example of how curricula and programs can be developed in order to change higher educational science education through the inclusion of Indigenous perspectives.
